Table of Contents

1. About the Conference

Welcome to the 15th Biennial of the ISATT Conference at the University of Minho, in Braga, Portugal (5-8 July 2011). The aims of ISATT include promoting, presenting, discussing and disseminating research on teachers and teaching as well as contributing to theory building and knowledge creation to enhance the quality of education.

School and universities, teachers and teacher educators are facing a variety of challenges in a rapidly changing world. While the future should not be imprisoned in the past, the past potentially provides valuable lessons for constructing the future. The theme of the 15th Biennial ISATT conference, Back to the Future: Legacies, Continuities and Changes in Educational Policy, Practice and Research, focuses attention on a set of concerns that apply to efforts worldwide to meet such challenges through research which contribute to the improvement of the quality of teaching and learning at all levels of education.

The ISATT 2011 theme also resonates very well with the venue of the conference. The historic city of Braga is more than two thousand years old but with a dynamic and modern atmosphere. One of the most beautiful cities in Portugal, Braga is known for its Roman remains, its baroque churches and splendid 18th century houses. Whilst the old city is resplendent in its antiquity, industry and commerce have brought to it a vibrant life style, with its universities, modern neighbourhoods, bars and restaurants.

The University of Minho is a public university which was founded in 1973. It is renowned for the quality of its teaching, the quality of its students, for the public recognition given to its Alumni, and for its strong links with the local community and surrounding region. It has a student population of approximately 16.000, including 3.900 postgraduate students, and 1.200 teaching staff in 11 Faculties: Architecture, Psychology, Education, Arts and Human Sciences, Social Sciences, Economics and Management, Engineering, Law, Nursing, Sciences and Health Sciences.

This attractive venue, the wide range of topics included under the conference theme, as well as the social programme will ensure that your participation at ISATT conference 2011 will be most enjoyable, professionally rewarding and that you will return home with many memories to cherish.

Maria Assunção Flores, PhD
Chair of ISATT 2011

1.1. Main Theme and Subthemes

Back to the Future: Legacies, Continuities and Changes in Educational Policy, Practice and Research

Schools and teachers are facing various challenges in a rapidly changing world. In such circumstances, discussing and sharing concerns of mutual interest regarding policy, practice and research is crucial to creating more sophisticated understandings of the various challenges as a first step in the improvement of education. While the future should not be imprisoned in the past, the past does provide valuable lessons that will undergo new iterations in constructing the future. The future will be multi-faceted and complex and the following sub-themes are intended to provide appropriate 'bricolage' from which to build the future of education.

Sub-themes

1. Teacher Education and Professional Development

Recent changes in educational policy worldwide have affected teachers' work and life in all kinds of intended and unintended ways, while research evidence is conflicted regarding many of these influences. Evidence of this contested terrain has implications for teacher education, including initial preparation and continuing professional development understood as a lifelong continuum. What are the continuities and changes in teacher professionalism? To what extent have policies on teacher career and evaluation impacted upon teaching quality in schools and classrooms? What are the emerging tensions in terms of teacher morale, collaboration and sense of vocation, on the one hand, and performativity, accountability, individualism and compliance on the other? What lessons can be learned from the past in order to enhance teacher professional learning?

2. Educational Leadership in Context

Societal and cultural changes, locally, nationally and globally, impact in many ways upon educational leadership. What are the implications of these for policy, practice and research? How do school leaders cope with these changes in order to promote student learning and teacher commitment? What are the challenges that teachers as leaders face in school and classrooms? What is the role of school leaders, teachers and other stakeholders in improving education for all in contexts of increasing diversity?

3. Learning Communities and Networks

Networks and partnerships have been increasing in number and variety as a means of meeting new and emerging challenges to education professionals. In addressing these trends in contemporary societies, a sense of community and democracy emerges as possible responses to working in uncharted terrain, and as a means of building capacity and creating some situated certainty. What kind of partnerships in education may be built amongst universities, schools and working professional organizations? What kinds of links may be developed amongst teachers, parents and other educational professionals? What is the role of learning and practice communities for equity and inclusion? What is the contribution of other stakeholders? In what ways may these communities be created and nurtured?

4. Teaching in a Digital Culture

Information and Communication Technologies are increasingly a pervasive presence in society and in people's lives. Children and young people are more and more accustomed to digital culture as part of their lives at school, at home and in the community. What are the challenges for schools and teachers'

work? How are these technologies to be deployed for purposes of teaching and learning in classrooms? What is the impact of ICT on pedagogy and what is its unrealized potential? What teaching and learning possibilities are inherent in electronic games? What is the potential of e-learning in initial teacher education and ongoing professional learning across the lifespan?

5. Challenges in Higher Education

During the past decade in particular, Higher Education has been made more accessible to an increasing number of students. Such developments represent considerable challenges to established and traditional institutional structures, cultures, curricula and pedagogies. What are the significant policies and trends in Higher Education nationally and internationally? What has been the impact of teacher and student international mobility on educational practice and research? What is the role of teacher educators in this new scenario? How can the scholarship of teaching and learning be enhanced in Higher Education institutional environments, both virtual and real?

6. Research, Knowledge and Change

This sub theme will focus on the contributions of research in the policy and practice arenas and, within this, the role of researcher as distanced observer of events or active agent of change in the system. To what extent should researchers promote change? To what extent should researchers seek to add to knowledge and understandings whilst staying outside the action? What kinds of research impacts most on thinking and practice? How do we know? And, what is the role of the researcher in the formation and reform of policy priorities?

THEME 1
Teacher Education and Professional Development

2 - A Self-study Theoretical Framework for Teachers' Learning and Teaching of a Topic

Fhatuwani J. Mundalamo

Department of Mathematics, Science and Technology Education, Faculty of Humanities, Tshwane University of Technology, South Africa
MundalamoFJ@tut.ac.za

Abstract: This paper presents a teacher's theoretical framework/ model of conducting a self-study where the participant wants to learn a new topic and also evaluate the knowledge acquired. The model presented in this paper indicates how a teacher who finds it difficult to learn and understand a topic in science can learn and teach such a topic, and later evaluate herself. The first part of the model explains how a teacher can learn a topic and evaluates himself/ herself with the assistance of a mentor. I also argue that once a person is assisted by the mentor, there is no need to seek the mentor's assistance in future if all the items in the model are mastered. The self-study candidate can then utilize the self-assisted theoretical model to learn a topic different from the one learnt in the presence of a mentor.

Keywords: Self-study, concept map, learning, teaching

BACKGROUND AND INTRODUCTION

This paper presents a theoretical framework that school teachers can use to learn, prepare and teach a topic that is unfamiliar to them or any other topic that they find difficult to learn. The framework indicates a number of stages that the teacher should undergo before she is confident about teaching a topic. The stages include the involvement of a mentor/ peer at the beginning of the process, drawing of concept maps to track knowledge development of the teacher, the use of CoRes and PaPe-RS to help the teacher in understanding what to teach and what not to teach, and video-taped lessons to evaluate the lessons.

Most school teachers struggle to teach topics that they are not familiar with. These topics are either new in the school curriculum or they were never part of the teachers college curriculum during the particular teachers' training. Although some teachers have enough teaching experience, they still lack confidence because they lack subject matter knowledge. In some countries like South Africa, teachers undergo what is known as in-service-training workshops. These workshops equip teachers with some knowledge which is not enough to provide confidence to the teachers while they teach in their classrooms.

The theoretical framework discussed in this paper discusses in detail how a teacher learns and teaches a topic he was not familiar with or a difficult topic. The teacher's knowledge development in the new topic is evaluated using the concept map analysis at the end of the learning and teaching cycle. In most cases the first concept map will indicates less links between concepts. This is so because the teacher has not acquired/ learned enough to make such connection. After reading and discussing with the mentor, the teacher knowledge develops. This is usually confirmed by the concept maps that are drawn at later stages.

CoRes and PaPe-Rs focus the teacher on aspects of the lesson that are important for the students to know and also information that the students should not know at this stage. At the end of the learning and teaching process, the teacher goes back and evaluates each stage. This is done for the teacher to know how he learned and taught the topic so that he can remind himself while preparing to teach similar challenging topics. Such reflections also empower the teacher with enough knowledge to share with other teachers.

The skills acquired while learning and teaching a particular topic can be used to learn and teach any other topic they find challenging to teach. Teachers can also share their experiences with other teachers on how they empowered themselves with this framework. As a result, other teachers will follow the same procedure while learning and teaching topics that they find challenging.

Once a teacher has acquired the learning and teaching skills of dealing with difficult topics, she does not need to work with a mentor when learning and teaching different topics. Some aspects of this theoretical framework will now be embedded in the mind of the teacher. It is however advisable that the teacher draws concept maps throughout the process so that he can know whether his knowledge is developing or not.

This study is influenced by my interaction with teachers who were enrolled as Honours and Masters students. I supervised the two teachers while they were doing a self-study in teaching physics topics, i.e. self-study on

teaching electricity and magnetism, and self-study on teaching electromagnetic induction respectively. Although the structured theoretical framework is presented for the first time in this article, its items proved to be successful in the two teachers' self-study projects.

RELATED LITERATURE

Self-study
Teachers need strong Pedagogical Content Knowledge (PCK) in order for them to be best possible teachers (Shulman, 1986, 1987). If teachers' subject matter knowledge is poor, they can resort to self-study. Self-study has been found to be beneficial by different researchers. Amongst studies that discussed self-study are studies by Bullough and Pinnegar (2001) about quality in self-study research, Dadds (1993) about the nature of the learning climate, Feldman (2003) about validity and quality, Dinkelman (2003) about promoting reflective teaching, All and Havens (1997) about concept mapping as a teaching strategy, and Hamilton and Pinnegar (2000) about trustworthy and integrity. Self-study is used to promote reflective teaching (Dinkelman, 2003). This is so because when a teacher conducts a self-study the ultimate aim is to reflect on himself. There should first be a need or a reason and willingness for the teacher to want to reflect on himself. Dinkelman (2003) defines a self-study as an "intentional and systematic enquiry into one's own practice" (p. 8). Experiences gained in conducting one self-study about a particular topic can be used to learn other topics different from the initial one in future (Dinkelman, 2003). In this article, the discussion of self-study only relates to the study conducted by a particular teacher with the aim of developing new subject matter knowledge and pedagogical knowledge.

Concept map
Concept mapping is a classroom technique that can advance learning (Kinchin, Hay & Adams, 2000). If the concept map drawn has missing linkages, this then indicates that there is a need to acquire more new information (All & Havens, 1997). The amalgamation of all definitions of a concept map leads to Wandersee's assertion that 'to map is to know' (Kinchin et al., 2000).
Concept maps are a useful tool in the improvement of science education. For example, concept maps are useful as: a learning strategy, an instructional strategy and also a means of assessing students' understanding of science concepts (McClure, Sonak & Suen, 1999). Each concept map drawn by a particular teacher is unique and shows the teacher's "personal expression of meaning for the selected material or subject matter" (All & Havens, 1997, p. 1210). This article is however concerned with the first category, viz, concept mapping as a learning strategy for teachers who find it difficult to teach a particular science topic. Although several literature including McClure et al. (1999) indicate that concept mapping is a viable tool for investigating students' misunderstandings, this article discusses concept mapping as one of the tools that teachers use to learn about the content unfamiliar to them.
Similar to what concept mapping does for students, it can also assist in moving the teachers "away from rote learning modes toward meaningful learning" (All & Havens, 1997, p. 1210). Learning development can be traced by evaluating the concept maps drawn. If concepts are learned by a teacher, he will be able to connect those with linking words in a concept map. Meaningful learning would occur when the teacher seeks relationships and integration of new knowledge with prior knowledge. This is dependent on the extent which the teacher is motivated to integrate new knowledge with old knowledge (All &Havens, 1999).

Concept map evaluation
There is usually a need to evaluate a concept map to see if the was some new knowledge acquisition. At initial stages of the learning process and drawing up of concept maps, the mentor would examine the content and the structure of the concept map (McClure et al., 1999) to see if there is some evidence of new knowledge. The evaluators of the concept maps should have variations in the content knowledge of the particular topic. The evaluator should be able to say something at the end of the evaluation about the teacher's content knowledge about the topic covered. If the procedure of drawing a concept map is complex, there would be greater chance that teachers' focus about mapping processes may affect the quality of their maps (McClure et al., 1999).

CoRes and PaP-eRs
Teachers possess knowledge and skills of teaching that they cannot easily impart to other teachers. Some of the causes of this are "the demands of time, curricula and student achievement" (p. 371) (Loughran, Mulhall & Berry, 2004). For example if they can be asked to narrate how they teach a particular topic they might find

doing that to be difficult. Because of this reason, Loughran, Milroy, Berry, Gunstone and Mulhall (2001) provided ways in which knowledge can be captured articulated and potrayed to others. If well documented, this knowledge will then be useful to other teachers who would like to know the strategies to follow in teaching a specific topic. Loughran et al. developed what they called Content Representations (CoRes) for articulation and portrayal of a certain topic under consideration and (Pedagogical and Professional experience Repertoire) PaP-eRs to eliminate certain aspects of the CoRe. I will explain how a teacher can make use of the CoRes to facilitate his learning and also assist those teachers who might want to acquire some knowledge on how to teach a particular topic. Besides helping other teachers, the teacher also benefits from CoRes and PaP-eRs by himself since these can remind him of how he prepares and teaches the topic.

TEACHERS' LEARNING SELF-STUDY MODEL

In this section, I explain how the two models assist teachers to: acquire 'science' knowledge from different sources, explain how they will teach a lesson, draw concept maps, design lesson plans, teach a topic they regarded as difficult to teach, and finally evaluate if they indeed acquired some knowledge. In Figure 1, the mentor plays an important role of making sure that the teacher is assisted in drawing the first concept map. I recommend that the teacher draws the first concept map before he interacts/discusses with the mentor. However, this might not be possible if the teacher does not know how to draw a concept map. It is therefore important for the mentor to also give a detailed lecture on how to draw a concept map. In a situation where the teacher is meeting the topic for the first time, the concept map will lack concepts to be linked and linking words. This shows that the teachers' knowledge has not developed yet.

In order o make sure that some learning start to take place, the mentor should give an introductory lecture about the topic to be learned. However, the lecture about the topic under consideration should not be a thorough one since it can confuse the teacher. This should then be followed by a lecture offered y the mentor. The second concept map should be drawn after the mentor's lecture. This will allow the teacher to acquire some concepts that could be added and linked to other concepts that appear in the first concept map. In a case where the teacher is struggling to understand the topic under consideration, the second concept map might not be that different from the first one. If that happens, the teachers should not be worried because the mentor can still provide extra classes until he is satisfied that the teacher is confident about the content or subject matter. The process of drawing concept maps can continue until a stage where the teacher is ready to draw a lesson plan to teach to his students.

It is however advisable that before embarking on drawing a lesson plan (although not compulsory), the teacher can also read literature related to the topic to supplement knowledge acquired through interaction with the mentor. This literature might include journal articles and books. Such literature will also assist the teacher in drawing meaningful concept maps. The teacher can draw as many concept maps as he possibly can. After all lessons related to the topic have been presented to students in class, the teacher can then draw the last concept map.

The evaluation of concept maps should only take place after the last concept map has been drawn. This is to make sure that the teacher and the mentor can be able to compare all the concept maps and see if there was some knowledge development through the process.

The teacher should then prepare a lesson plan, which he should present in front of the mentor. In a situation where there are some audiences, they can assist in listening and thereafter commenting on how the teacher's lesson plan and presentation style can be modified. The teacher should make the necessary change as suggested by the mentor and the audience. Thereafter, the lesson can be presented again to the mentor and/or the audience for the second and final time before it is presented to the students in class.

The CoRes and PaP-eRs are necessary in reminding the teacher about important and not so important aspects of the lesson that should and should not be treated in class respectively. For example, a question like 'what is it that you think is not important to mention to the students in the topic you will teach today?' reminds the teacher about important aspects of the lesson. Prompting of such knowledge makes sure that the teacher does not teach everything related to the topic, but concentrates on the 'big ideas'. As can be seen in both Figures 1 and 2, the teacher who is aware of CoRes and PaP-eRs related to a topic under consideration will develop or has already developed enough content/subject matter knowledge about that particular topic. The knowledge of a topic's CoRes and PaP-eRs differentiates the science teacher from a scientist. This is so because a scientist might not know what aspects of the topic like electromagnetic are important for students to know at a particular stage, whereas for teachers such is easy to remember.

The evaluation of the whole self-study project should be done right at the end. This allows both the teacher (Figures 1 and 2) and the mentor (Figure 1) to assess the overall development of the teacher's knowledge

about the topic that the teacher is learning. However, it is not compulsory to evaluate all aspects of self-study at the end.

I recommend the use of these self-study models for both research and personal development of teachers.

8 - Induction Workshops as Reflective Support Groups for Beginning Teachers

Barbara Fresko[1] and Fadia Nasser-Abu Alhija[2]

[1]Beit Berl Academic College
barbara@beitberl.ac.il
[2] Tel Aviv University
fadia@tau.post.ac.il

Abstract: The purpose of this paper is to explore the operation and contribution of induction workshops operated as reflective practice groups for new teachers. The context was the Israeli induction program which consists of in-school mentoring, workshops, and evaluation. Data were obtained from 378 new teachers and 29 workshop leaders using questionnaires, from 16 new teachers and 14 workshop leaders who were interviewed, and from observation of 20 workshop meetings. Findings showed that workshop discussions focused primarily on coping with discipline problems, building self-confidence, and providing emotional support. Topics discussed generally derived from participants' concerns to which workshop leaders contributed theoretical foundations. The contribution of the workshops was rated only as moderate. Its main contribution was affective: the provision of emotional support during the initial transition to teaching. However, findings imply that well-implemented workshops can meet the diverse needs of new teachers and contribute to their professional development.

Keywords: teacher induction, reflective workshops, learning communities

INTRODUCTION

Terms such as "reality shock" (Veenman, 1984) or "praxis shock" (Kelchtermans & Ballet, 2002) have been used to describe the emotional reactions of new teachers when confronted with the realities and responsibilities of being a teacher. Being a new teacher is not just about anxiety, stress, and frustration, rather it is also an important learning stage in which fledgling teachers expand their content-specific repertoire of teaching strategies, acquire important practical knowledge related to school norms, and policies, and mold their professional identities. In order to help new teachers both cope and develop, induction programs are being implemented in many countries around the world (e.g., Feiman-Nemser, Schwille, Carver & Yusko, 1999; Howe, 2006; Ingersoll, 2007; Moskowitz & Stephens, 1997).

Research on induction tends to focus on in-school mentoring (e.g., Ingersoll, 2007; Ingersoll & Smith, 2004; Wong, 2004). Little is known about the use of other induction strategies. This paper explores the operation and contribution of induction workshops operated as reflective-practice groups in the context of the Israeli induction program for new teachers. While professional learning communities and reflective practice groups have been studied (e.g., Wood, 2007), their use as an induction strategy has received little attention. The few studies which have been conducted indicate that shared reflective practice builds the knowledge base for beginning teachers, contributes to their sense of efficacy, and leads to empowerment (Cady, 1998; Chase, Germundsen, Brownstein, & Distad, 2001; Herrington, Herrington, Kervin & Ferry, 2006). The present study aims to contribute to the paucity of knowledge in this area.

THE RESEARCH CONTEXT

The induction program in Israel was gradually introduced over a period of several years and is now a prerequisite for obtaining a permanent teaching license. The program is intended to increase the professional status of teachers as well as to ease their entry into the profession (Israeli Ministry of Education, 1999). The program is financed and operated by the Ministry of Education with the cooperation of the higher education institutions and the public school system.

Three components make up the induction program: in-school mentoring, workshops, and evaluation of new teachers. Workshops which are the focus of this study are operated by teacher training institutions and serve as professional frameworks within which new teachers are expected to share their experiences with others in a nonthreatening and supportive environment. Workshops are intended to help participants conceptualize their experiences, connect practice to theory, and develop their professional identities. Approximately 15-17 new teachers participate in a workshop. Workshops take place in the teacher training institutions, and workshop leaders are pedagogic specialists who teach in teacher training programs. Workshops take place

weekly or bi-monthly throughout one school year. Participating in a workshop is required of every new teacher and they begin attending an induction workshop once they receive a teaching assignment in one of the schools.

Data for this paper were collected as part of a comprehensive evaluation of the induction program in Israel. For more information about the program, see Fresko and Nasser-Abu Alhija (2009).

METHOD

Participants

Quantitative data were obtained from a sample of 378 new teachers and 29 workshop leaders. One workshop was randomly selected from each academic teacher training institution in the country. Both the new teachers and the workshop leaders in these workshops participated in the study. The new teachers in the sample were mainly female (80%), who were distributed equally between elementary schools (49%) and secondary schools (51%). With respect to subjects taught in school they were distributed in the following way: 27% taught sciences and/or mathematics, 20% taught humanities and/or social sciences, 18% taught languages, and 35% taught some combination of subjects from unrelated fields (e.g., mathematics and language). Workshop leaders in the sample were mainly female (83%), 71% had MA degrees, and on the average they had 19 years of teaching experience.

In addition qualitative data were collected by means of observations of workshop sessions as well as semi-structured interviews with 16 new teachers and 14 workshop leaders. For this phase of the study, five teacher training institutions were selected taking into account their geographical region and the type (state secular and religious schools), and level (elementary, junior high school, and senior high school) of the schools with which they work. Two workshop groups from each of the five institutions were selected at random for observation. New teachers were selected for interviewing from these institutions so as to maintain the balance among region, school type, and school level, and an attempt was made to interview their workshop leaders.

Research instruments

Collection of quantitative data was carried out by means of two questionnaires which were presented to new teachers and workshop leaders, respectively. The questionnaire for the new teachers included information about personal background, their training as teachers, employment during the first year of teaching, their mentoring experience within the induction program, the induction workshop, the evaluation process, and their attitudes towards the induction program and towards their socialization into the school. The questionnaire for workshop leaders addressed professional and demographic data, workshop characteristics, workshop content, training received prior to becoming a workshop leader, and attitudes towards the importance of the workshop as part of the induction program.

Semi-structured interviews with new teachers included questions about various aspects of the induction program. Questions which focused specifically on the induction workshop related to four dimensions: organization, content, contribution, and evaluation. Interviews with their workshop leaders addressed leaders' professional background, perceptions of their role as workshop leader, information about the content, organization, and operation of the workshops as well as their attitudes regarding the need to train workshop leaders and their evaluation of the induction program as a whole.

Procedure

The induction coordinator at each of the teacher training institutions administered the questionnaires to the new teachers and the workshop leaders in one of the workshop meetings which took place towards the end of the school year. The questionnaires were completed on-site and returned in a sealed envelope to the coordinator, who forwarded them on to the researchers.

The interviews were conducted face-to-face in a setting which was convenient for the interviewees. Interviews which lasted on the average about 45 minutes were taped and later transcribed. Two field observations of entire workshop meetings were conducted by a researcher in each of the 10 workshops selected for the sample. Overall 20 observations were made.

FINDINGS

Findings related to both the operation of workshop groups and their contribution to the new teachers.

Workshop operation

Two main aspects of operation were examined: the operation of the workshop groups and the content of workshop sessions.

Group dynamics are expected to be an important aspect of effective workshops which means that groups should be stable and made up of participants with common concerns. Data showed that this was often not the case. Most workshops (97%) opened between August and October. However, many workshop leaders (34%) reported that new teachers joined on-going workshops as late as December or January, disrupting the stability of the group.

As can be seen from Table 1, half of the workshops were homogeneous in make-up with respect to subject matter and grade level taught by the new teachers, whereas the others were heterogeneous, composed of new teachers who taught different school subjects and different grade levels.

Table 1: Distribution of workshops by composition of new teachers (N=29)

Composition of workshop	%
By teacher training program	32.1
By subject matter specialization in training	3.6
By school level taught	7.1
By subject matter taught	3.6
By institutional considerations	7.1
By new teacher considerations	46.4

Workshop leaders were presented in the questionnaire with a list of activities, issues, and concerns that could be addressed in the workshops. They rated the extent to which their workshops provided support to the new teachers in each area on a scale from 1 (*not at all*) to 5 (*to a very great extent*). Factor analysis of the items yielded three domains: emotional, ecological, and didactic. Means and standards deviations of their ratings on each item and in each domain are presented in the left-hand column of the data in Table 2.

As can be seen from Table 2, workshops focused on providing new teachers with emotional support. More specifically, they focused heavily on coping with discipline problems, building self-confidence, coping with frustrations, and dealing with pupils' personal problems. According to the workshop leaders, workshops rarely addressed didactic issues. However, it should be noted that within this category, moderate attention was given to learner assessment, adapting teaching materials and strategies to pupils' needs, and time management.

Table 2: Content of the workshops and its contribution to new teachers (scale:1-5)

Domains & Items	Content of workshops (29 workshop leaders)		Contribution of workshops (379 new teacher)	
	Mean	SD	Mean	SD
Emotional Support	**4.18**	**0.38**	**3.20**	**1.05**
Coping with frustration	4.50	0.64	3.59	1.22

Use of instructional aids	1.96	0.90	2.00	1.24

Information from the interviews and observations enrich these findings. Analysis of the observation data yielded two main types of activities: firstly, discussions of various topics which were raised by the new teachers and derived from their experiences in school, and secondly, topics raised by the workshop leaders with the intention of connecting the new teachers' experiences to relevant theories. New teachers tended to focus on their difficulties, deliberations, and dilemmas in school and in the classroom. The workshop leaders coordinated the discussion so as to encourage the new teachers to reflect on their experiences, gain insight into their practice, and help one another.

Who tends to determine the workshop content? Information obtained from the workshop leaders indicated that topics raised spontaneously by the new teacher were most dominant in the workshop meetings. Least dominant were topics considered to be important by the workshop leaders that were presented frontally. Often group discussions were planned in advance around topics selected by the new teachers or initiated by the workshop leaders.

The topics discussed in the workshops changed over time. In the beginning workshop sessions focused on difficulties in the classroom, difficulties adjusting to the rules and norms of the school, and dealing with parents. As the year progressed other concerns emerged, such as motivating pupils, assessing learning, and the emerging professional identity of the new teacher.

Contribution of the workshops

The new teachers received the same list of activities, issues, and concerns which had been presented to the workshop leaders when they indicated workshop content. The teachers were asked to rate on a 5-point scale to what extent the induction workshop contributed to them in each area. Summary scores were also calculated for their responses in each of the three domains mentioned above. The data are presented in Table 2.

As can be seen from the means presented in Table 2, the contribution of the workshops was rated, at best, as only moderate. However, the new teachers' responses were highly diverse as reflected in the relatively large values of the standard deviations. It is worth noting that contribution was greatest with regard to emotional support, followed by ecological support, and was least in the area of didactic support. This pattern corresponds to the emphasis put on these domains as reported by workshop leaders.

Analysis of data from the interviews and observations indicated that the atmosphere in the workshops encouraged new teachers to be open and frank without fear of judgment. As one workshop leader said, "Here they can discuss any difficulty or any problem and get support without being judged. Here it is okay if things are difficult. Every feeling is legitimate and the new teacher knows she is never alone." In this same vein, new teachers referred to the workshop as a safety zone that allows professional frankness.

In contrast to the low rating given to didactic support, the new teachers were seen in the observation of workshop sessions to engage in reflective dialogue with their peers about alternative didactic approaches. In addition, they were observed to share both successes and failures in the classroom.

Both new teachers and workshop leaders were asked to recommend based on their experience the desired period of time for having induction workshops. Responses varied. Many new teachers found the workshops very useful as they were (42%) and some even wanted to extend them beyond one year (8%), while others thought that they were necessary only for the first 4-5 months of the school year (35%), or that they should be eliminated from the induction program altogether (15%). Workshop leaders were of another opinion: 86% felt that the workshops should meet throughout one school year, while 14% recommended extending the workshop for a second year.

SUMMARY AND DISCUSSION

The transition from *learning to teach* to *teaching to learn* takes place in the first years of teaching. Since this transition is not easy for most new teachers, induction programs have been developed. Studies of induction programs tend to concentrate on the mentoring component of such programs, ignoring other aspects. In the present study a different component of induction has been examined in the context of the Israeli induction program: year-long workshops for new teachers. The workshops were examined in order to understand their operation as well as their contribution to easing the entry of new teachers into the teaching profession.

Findings revealed some major issues related to the operation of the induction workshops. The first issue related to the organization and composition of the workshop groups. One would expect workshop groups to be made up of new teachers who are teaching similar school subjects and similar grade levels. While many issues are probably common to all beginning teachers (e.g., motivating and disciplining pupils), it is likely that discussions aimed at searching for solutions to these problems would be more relevant to all when the new teachers in the group have similar teaching assignments. Moreover, discussions focusing on didactic issues are likely to be more effective if all participants have similar teaching assignments. The fact that only half of the workshops were organized along these lines indicates that there are practical considerations which unfortunately did not make homogeneous groups always possible. Both institutional (e.g., budget constraints) and personal considerations (e.g., convenient scheduling of workshops) could not be ignored. Moreover, these constraints often led to new teachers joining workshops 3-4 months after they had gotten underway. Perhaps had more groups been homogeneous and all members of the groups had started out together, the contribution of the workshops would have been perceived more positively.

Based on the observations and interviews, workshops in this induction program seemed to serve as both reflective-practice groups and a place where the new teachers could express their feelings, frustrations, and deliberations in a safe and supportive environment. However, when rating the contribution of the workshops, the new teachers emphasized the emotional side, tending to see them more as a place for venting emotions and difficulties, as opposed to a place for discussing didactic approaches in teaching. It should be noted that findings of earlier studies (Cady, 1998; Herrington et al., 2006) emphasized the contribution of induction workshops to building professional knowledge. The emotional aspect of becoming a new teacher was not mentioned. However the results here suggest that the emotional adjustment of becoming a teacher cannot be ignored and that workshops can contribute to easing the tensions surrounding this transition. The workshops which were held in a teacher training institution enabled the new teachers to distance themselves from school, pupils, and colleagues, with whom they interact daily and provided them with a professional outlet for openly discussing difficulties and frustrations with others who are experiencing similar feelings. In this respect induction workshops have an advantage over in-school mentoring where the mentor is part of the work context and often one of the school personnel who will later evaluate the new teacher. This is not to say that one should replace the other, but that they are complementary. Each in its own way can help new teachers adjust to teaching and continue their professional development.

In conclusion, since the Israeli Ministry of Education allows much leeway in running induction workshops, they differ greatly with respect to composition, content, and operation. The result is great variation in participants' evaluations. However, the findings imply that well-implemented workshops can meet the diverse needs of new teachers, ease their tensions, and contribute to their professional development. Clearly, further research is required in order to better understand the dynamics of induction workshops and their possible benefits for new teachers.

10 - The Fuzziness of Failing Student Teachers – Indicators and Procedures

Ulla Karin Nordänger[1], Per Lindqvist [2], Per Gerrevall, Henrik Hegender, and Susanne Linnér

Linnaeus University, Sweden
[1]Ulla-karin.nordanger@lnu.se, [2]Per.linqvist@lnu.se

Abstract: In this recently started Swedish project we aim to study teachers' professional competence and quality from a slightly different perspective. We want to raise questions regarding teacher education and its function of "gatekeeping" i.e. the practice of failing students in the school based periods of teacher education. What is regarded as *not* enough quality – or not enough competence? Which procedures for quality control regarding the students practical knowing operate within teacher education and which indicators are decisive when the educators decide to fail a student? The specific research questions are:

How is attention drawn to a student that fails to meet the standards for proper quality? Which procedures are set at work when it is noticed that a student risks failing? Which procedures follow a decision to fail a student?

Which criteria are seen as decisive when a student is assessed as risking failure and need to be forced to either discontinue his/her education or given extra assistance? How do different actors in teacher education, i.e. teachers from the university and supervisors from schools, answer the question: Who is not competent enough to become a teacher?

The practice of failing in teacher education, especially in the school based phase of the education, is an area that has received very little attention in educational research. The small number of studies in the area shows that teacher educators do argue that shortcomings in the students' academic and practical knowledge are fairly easy to discover, but at the same time difficult and problematic to manage. Decisions to force student to discontinue his or her education become prolonged processes that are felt to take much time and effort from those involved.

Since the accumulated knowledge of this area may be considered as shallow, this study has an explorative and inductive nature with a theory-generating and flexible design. A pilot study, in form of an e-mail survey to Swedish teaching practice coordinators, has been conducted. The result indicates that we are entering a somewhat dim area. Actual numbers of failed students seem hard to present distinctly, and several of the respondents express that the question in the e-mail has drawn their attention to the problematic character of the area. "This needs to be enlightened", seem to be the overall opinion. To widen the empirical foundation, face-to-face interviews with those responsible for school-based training and records from cases within the practices of failing will be collected. From the analysis of data, typified cases will be constructed and presented as examples to form a foundation for discussion in focus groups where the examiners, both from universities and schools, can debate the strategies that were carried out in the actual cases as well as those that are possible. Finally, in a contrasting study, interviews will also be conducted with those responsible for the practice element at law-enforcement and nursing-training programmes.

The project is in an initial phase, looking for possible international collaboration.

Keywords: assessment, teacher students, teacher education, failing.

Issues regarding the quality of education are prominent on international as well as national agendas. Two recent studies, Hattie's (2008) wide-ranging meta-study of influences on achievement in school-aged students and McKinsey's study of successful school systems in the industrialised world (Barber & Mourshed, 2007), have earned much attention in this area. These studies point to that a decisive factor, positively related to student performance, is the quality of the teachers. Signals that results in Swedish schools are deteriorating when compared to international results have prompted the Swedish Ministry of Education and Research (2006) and The Swedish National Audit Office (2005) to stress the importance of enforcing and clarifying the standards of teacher competence. One may naturally question the relevance of international comparisons of student achievement, but it is obvious that they have led to the pursuit of definitions and criteria regarding high competence and excellence in teaching (OECD, 2005). The report "Legitimation och skärpta behörighetsregler" ("Authorization and sharpened rules of qualification": Swedish Ministry of Education and Research, 2008:52) may be seen as a response to this pursuit. Here, it is suggested

that it is necessary to "develop and establish a national competency profile" (p. 186 – *our translation*) for Swedish teachers.

What is a competent teacher then? How do you decide who is eligible? In both the political and everyday discussions regarding teacher quality, there are a multitude of opinions, not only varied but often contradictory, on how this phenomenon can be measured or predicted. These ideas, however, all appear to define teachers' education and assessment of teachers as processes of *inputs*, such as knowledge about instructional methods, pedagogical– or subject knowledge, or on teacher *outputs*, i.e. teaching performance or pupils' achievement.

The results from research that aim to establish predictors for the relationship between teacher education and teaching quality may in the same way be divided between those that focus on inputs and those that focus on outputs (Goodwin & Oyler, 2008). These studies either focus on the knowledge and skills student teachers possess or need to possess *before* graduation (inputs) or how teachers realize this competence *after* graduation (outputs) (Zumwalt & Craig, 2005). In this project, we intend to explore teacher quality as an input value. Thus, we focus our attention on teacher education, the stage where prospective teachers are located before they graduate and which should function as a "gatekeeper", that is, the stage that has the authority to ensure quality and to monitor who is qualified enough to pass the gate.

The research questions

We want to examine a particular part of the phenomenon teaching quality as input. The aim is to make visible, describe and understand the particular practice – the practice of failing – which appears as a crucial part of the quality control of teacher education. In doing so, we intend to address the following basic research questions:

- Which procedures for quality control regarding the student's teaching competence operate within teacher education?
- Which indicators of teacher competence are decisive when the educators decide to fail a student?

Teacher education can be roughly divided into the academic phase and the school-based practice phase (verksamhetsförlagd utbildning, VFU). It is in relation to the latter phase that we want to generate knowledge regarding the function of teacher education as gatekeeper. The specific research questions focus the assessment of student performance during their school-based practice. The specific problems that this project aims to address are therefore:

Procedures
- How is attention drawn to a student that fails to meet the standards for proper quality?
- Which procedures are set at work when it is noticed that a student risks failing?
- Which procedures follow a decision to fail a student?

Indicators
- Which criteria are seen as decisive when a student is assessed as risking failure and need to be forced to either discontinue their education or given extra assistance.
- How do different actors in teacher education, i.e. teachers from the university and supervisors from schools, answer the question: Who is not competent enough to become a teacher?
- How do these arguments agree with the formal assessment criteria for school-based practice (VFU) at the university in question?

In addition to this, we are, from a quantitative perspective, interested in the effects of the practice of failing in teacher education. A pilot study, in form of an e-mail survey to VFU coordinators at all teacher education programmes in Sweden has been conducted. At a glance, the results indicate that we are entering a somewhat dim area. Actual numbers of failed students seem hard to present distinctly, and several of the respondents express that the question in the e-mail has drawn their attention to the problematic character of the area. "This needs to be enlightened", seem to be the overall opinion. The following questions must therefore be addressed and more thoroughly studied:

- How many students are failed after their school-based practice?
- How many of them are actually forced to discontinue their education?

Data and research used in teacher policy formulation is to a large degree self-referential (OECD, 2005). To help provide a perspective on trends and findings in regard to teachers – as well as ideas for change – there is a need for comparative information from other areas of professional education and work. Consequently, as complement and with the intention of seeking contrasts against which the results can be reflected and discussed, we aim to make studies of empirical stages outside Swedish teacher education. This will be done by bringing our questions into two other arenas. Firstly into the education of two parallel human service professions (comparable regarding length of education, professional status, public function and whose vocational training, in Sweden, fairly recently became academic) - law enforcement and nursing. Secondly, into teacher education programs outside Sweden. We are therefore searching for international partners to the project.

BACKGROUND

Up until the 1960s, entry to teacher education was the "needle's eye" to prospective Swedish teachers. The assessment included the fulfilment by the applicants of a set of optimum requirements that were believed to describe the best raw material for shaping a good teacher. Here assessment was built upon validating normative characteristics. Since then, the system has been reversed and the entry demands are now based on a set of minimum requirements. In other words, the standards have taken on a negative rather than a positive character (Sjöberg, 2006). However, there are signs that the situation might revert back. For example, the most recent report regarding a new teacher education programme suggests that the possibility of arranging suitability tests in connection with the application process should be explored (Swedish Ministry of Education and Research, 2008).

Goodwin and Oyler (2008) note that the act of failing - especially in the practice based phase of teacher education - is an area that has received very little attention in educational research. Their own studies show that teacher educators do argue that shortcomings in the students' academic and practical knowledge are fairly easy to discover, but at the same time difficult and problematic to manage. The safeguards that are set in place often become vague and local and the management of them is further muddled by the fact that poor performance often is connected with students' diagnosed learning disabilities. The laws issued with the intention of furthering equal rights for students and counteracting discrimination (for example SFS 2001:1286 regarding the equal rights of students in higher education) help making the practice of failing into a delicate question for those involved (Goodwin & Oyler, 2008). In a noted series of article in the Swedish newspaper Dagens Nyheter, Zaremba (2008) writes about a number of incidents when teachers were reported for criticising students and how these incidents have led to teachers being very careful before bringing up the shortcomings of a student. Decisions to force student to discontinue his or her education become prolonged processes that are felt to take much time and effort from those involved. "For one student with a problem, it could take 50–100 hours to resolve" (Goodwin & Oyler, 2008, p. 478).

The assessment of student performance, and its relationship to teacher training, has both a *summative* function that rests on the demand that a government institution is required to estimate the quality of future teachers, and a *formative* function that is based on the educational intention that all educational institutions must support the development of the students. Raths and Lyman (2003) as well as Hegender (2010a; 2010b) show that feedback within teacher education often have a formative function. Feedback is rarely used summative, as a tool to fail or make students discontinue their education.

Goodwin and Oyler (2008) also show that teacher educators, when they make their assessments, put great emphasis on the student's attitude. Thus, issues and abilities such as flexibility, reflexion, and openness to teaching as well as intercultural understanding are perceived as central to becoming a good teacher. However, such attitudes are difficult to measure. Because of this, the hurdles that are set up become fluid. If students fail, they are given multiple opportunities to develop the required knowledge and several alternative assessment procedures are offered. The designs of these procedures mirror a way of viewing the road to become a teacher as a complex process (which it probably is). However, as regards to the function of keeping certain students outside the profession and/or the education, these types of hurdles are relatively ineffective (Goodwin & Oyler, 2008).

Research that describes cases where student performance during school practice are assessed as unsatisfactory and cases when students are asked to discontinue their training or redo their school practice are, as mentioned above, rare. However, Raths and Lyman (2003) have developed a classification chart that describes the performance of students during school practice. The chart consists of a continuum that moves from the negative pole – criminality – to the positive pole – teaching with best practices. Knudsen and Turley (2000) have investigated how students that risk failing their school practice are identified. The study shows that it is often the supervisor who "raises the red flag" and that the reasons why students are believed to risk

failing varies depending on how far into their training they have come. Decisions to ask students to discontinue their education seems to be easier to make the closer to the negative pole (see Raths & Lyman, 2003) the student is located. According to Sudzina and Knowles (1993), such behaviour is fortunately rare. It is more common that those responsible for the education intervene when students perform unsatisfactory in a more ambiguous way. In these cases, the solution is often to provide the student with one – or several – new school practice placements. In the mean time, teacher trainers often attempt to "council out" the student, that is, they recommend that the student leave the programme by suggesting alternative roads and possibilities. Goodwin and Oyler (2008) state that the function of teacher education as gatekeeper is to a large degree dependent on students' placement during school practice and how well the university and the schools where the practice takes place communicate. It appears to be rare that the academy has any control over who becomes a supervisor and even rarer that supervisors are handpicked to match the needs of individual students. They furthermore argue that the lack of such control has implications for how those in charge of controlling quality can use the information coming from the field and how great an importance school practice can have as a gatekeeper. "(S)chool partners are not at the place where they truly see themselves as gatekeepers" (Goodwin & Oyler, 2008, p. 480). Edwards and Protheroe (2004) mean that student teachers during school practice are treated as stand-in teachers that should be able to deliver teaching, rather than as students involved in education. Slick (1997) and Knudsen and Turley (2000) show that there is a problem related to the double and shared responsibility for student teachers that teacher educators and supervisors are expected to assume during school practice. The problems concern the maintenance of balances – between supervising and grading students, between – as a teacher educator from university – maintaining a good relationship with supervisors in schools while at the same time acting as a gatekeeper on behalf of the teacher education programme, and between the expectations on the supervisor of being able to support the students' learning of a practical, professional knowledge and the demand that teacher educators should represent the perspective of critical scrutiny of the professional knowledge of teachers (Slick,1997; Knudsen & Turley, 2000).

Finally, we want to mention that our own studies show that the criteria for grading students in school based training are vague and constitute a jumble of theoretical and practical knowledge forms (Hegender 2007). They also show that the student-teaching conferences are characterized by unclear roles and a relatively uncertain understanding of what is actually being assessed, and that these discussions are of a counselling nature rather than attempting to finally assess the student.

DESCRIPTION OF THE PROJECT

Since the accumulated knowledge of this area may be considered as shallow, this study has an explorative and inductive nature. However, the two research problems that concern the procedures and the indicators of the practice of failing prompt the introduction of theoretical perspectives that can give a direction to the analysis. The procedures for quality assurance can be related to theories regarding the transformed forms of control and regulation of the public sector in general that have taken place during the past 20 years (see, for example, Apple, 2007). New models used to manage and organize work, influenced by the market – what has been referred to as "New Public Management" (Busch et al., 2001) are now being introduced and new forms of inspection become generally accepted. National test systems are introduced, quality indicators appear, the results of educational programmes are published and compared and the evaluation of educational programmes becomes increasingly aggressive. These new forms of inspection build on the idea that individuals and organisations can be made responsible by demanding that they account for what they do. Occupations are now forced to open up and appear as more transparent so that they can be made public and reviewed. What could previously be settled with the help of experience and between "four eyes", in this case between the teacher educator and the municipal supervisor, must now become explicit and stand for public review. As education becomes increasingly identified with a market commodity, the demands of the customers on quality and predictability also increase, which means that those who produce the commodity must be exposed to new forms of inspection where the demands on accountability are increased and where quality, responsibility and blame are clearly connected (Lindqvist, Nordänger & Landahl, 2009). If a student teacher fails to reach the required quality, which arguments can then be used to support the failing of this student, how do these arguments stand up to an external review and who can be blamed for the failure to meet the desired results?

When it comes to indicators of teacher quality, these can be related to theoretical perspectives on, and research regarding, the knowledge of teachers. A rough division that allows this phenomenon to be more easily studied and realised can be accomplished by dividing the knowledge into theoretical knowledge and practical skills (Fenstermacher, 1994; Munby, Russell & Martin, 2001; Hegender, 2007). Such a division can

be expressed with the help of the concepts propositional knowledge and procedural knowledge (ibid). The foremost quality of propositional knowledge is that it is context independent; it can consist of knowledge *of* the practical field but then in more scholastic terms. In contrast, procedural knowledge is situated and personal. It consists of knowledge *in* the practical field, tied to what is done in the authentic school practice and it is only possible to develop and stage in this setting (Lindqvist & Nordänger, 2010). Student teachers may have knowledge about procedures and claim that they know how to do things, but that does not mean that they have procedural knowledge. Such knowledge only manifests itself in immediate connection with a certain action. It is because of this, as Hegender (2010b) has shown, that for example assessment discussions between teacher educators and students supervisors, without prior observation of the student, function as a blunt tool when measuring the procedural knowledge.

The focus of the study that regards the indicators of the assessment of teacher quality should also be related to theoretical models for assessing knowledge. Reynolds and Salters (1995) offer such a model that includes three assessment strategies. The first two are behavioural in nature. Activities are here assessed in relation to previously established professional task and assessment criteria. What separates them is that in the latter, the effects of the activity are also included in the assessment. The two strategies can be connected to research on teachers' competence and quality that measures the relationship between variables, so called effect studies. The main question for this type of research is to try to identify which behaviours, notions and expectations of the teachers that can be correlated to the learning results of the pupils. An example of such a study is McKinsey's previously mentioned study, in which so called "best-performing school systems" identified by the OECD PISA survey, have been analysed.

The third strategy of Reynolds and Salter's theoretical model describes the assessment of professional knowledge as a more complex phenomenon. To properly assess a student, this strategy demands that the reviewers have professional experience of the work related situations that are being assessed. What the student did during the situations that occurred must be assessed within this specific context. When using this strategy, prefabricated answers to a given situation are of limited value. A particular action may become meaningful because it is characterized by the values and ideals that the novice wishes to maintain. Because of this, it is difficult to assess knowledge simply through observation. The third strategy can be related to research that try to understand what teachers, from their previous experience, actually can do and know. This type of research starts with the individual and the conditions of the practice (see, for instance, Elbaz, 1983; Lindqvist & Nordänger, 2007).

The explorative and inductive character of the study calls for a theory-generating and flexible design (Robson, 2007). The theoretical perspectives mentioned should only be perceived as starting points and not as deductive models for the analysis of data. The collection of data is constructed round a combination of methods. Concerning the more general questions regarding procedures and indicators, as well as quantitative measures, surveys will be conducted, in the fall 2011, with follow up interviews using e-meeting technology. These will be aimed at those responsible for school-based education at all Swedish institutions of higher education that has a teacher education programme. To widen the empirical foundation concerning the procedures, face-to-face interviews with those responsible for school-based practice will be conducted. Should the initial interviews suggest that there are several interesting or relevant differences in the procedures, it will be possible to follow up these through additional on-site conversations.

To deepen the understanding of the phenomenon further, the methodology used when performing *case studies* is brought into play. Through initial interviews with those responsible for school-based practice at different universities, we are currently trying to identify different "cases" within the practice of failing with our focus directed on common as well as divergent aspects. As far as the selection of cases is concerned, we are trying to strive towards what has been termed contrasting cases. From the analysis of this data typified cases will be constructed (with the intention of not revealing identities), be presented as examples and form a foundation for discussion in focus groups where the examiners, both from universities and schools, can debate the strategies that were carried out in the actual cases as well as those that are possible.

The first stages of our study suggests that the practice of failing is accompanied by extensive records, formal and public as well as informal and private. To the extent that it can be made available, it will be collected. The analysis of both interviews and records will be made both inductively with the help of open coding (Glaser & Strauss, 1967), and deductively, that is, in relation to the theoretical starting points of the study. We will also compare the analysis of data with the official assessment criteria of each university (see Hegender, 2007).

However, during the empirical work we will consciously stay away from one perspective, namely the students'. Since this area may be perceived as ethically sensitive, we have chosen to complete refrain from data collections where the identity of the students can be revealed. The study concerns how an educational

assignment is managed by a professional institution and not about how single individuals fail in their educational ambitions.

DISCUSSION

The study should be perceived as an attempt to further penetrate, and add a new perspective to, the research area of teachers' professional knowledge and how this is valued and assessed. Sudzina and Knowles (1993) suggest that one of the reasons for the lack of research on teacher knowledge – observed from the negative pole - is that it may be difficult to make educators talk about "failures" since these are perceived as unwelcome and difficult. However, we think that it is of great importance that educational science sheds light on the zone that exists between entering a training programme and exiting it to become a professional. A decisive reason is that empirical data from the field creates an opportunity to study the question of professional competence from a slightly different perspective. To ask questions of the practice of failing regarding what is *not* perceived as professional quality may create space for alternative explanations and definitions of the phenomenon. The results from the study can in this way be applied in more general terms concerning several types of vocational education.

Results from the research project may also contribute to making the function of teacher education as gatekeeper clearer so that it can either be extended or reduced. More knowledge is needed on which safeguards that can be established to increase teacher quality. Knowledge must also be developed on how teacher educators measure, recognize and amend a lack of teacher quality and which factors they consider when a decision is taken on who is ready to be included in the teaching profession.

Abstract: In this paper we reflect on the impact of ICT in educational systems, and the importance of preparing Portuguese teachers to the challenges of the learning society. In order to contribute for the definition of a national program for the professional development of teachers in ICT, we present some international programs for the professional development of teachers in ICT discussing results on current implementation. We then present the recently launched Portuguese Plan of ICT Competences for teachers that define levels of digital literacy and certification. In order to add new insights into current discussion on the topic we present a review of literature on a theoretical framework that has shown effective for the integration of ICT into the classroom: the TPACK. Examples of successful experiences in different curricular areas already implemented and tested with will be presented and discussed in order to help Portuguese teacher educators in the design of activities to be carried out in education programs for in service teachers.

Keywords: Teachers training, Information and Communications Technologies, Technological Pedagogical Content Knowledge.

INTRODUCTION

Teachers can't stay indifferent to changes happening in the educational panorama, driven by the developments in Information and Communication Technologies (ICT's). We need to rethink pedagogical practices, methods and strategies, in a way that contributes to classroom innovation, and that presupposes curricular integration of ICT's.

The importance of curricular integration of ICT's is a recurring question in the educational policies level, both on a national and international scale. On this matter, many international organizations, namely the European Commission and the Unesco (in the Education domain), became aware of the need to answer the advent of the Information Society. As Silva (2001) tells us, Unesco, on the "Education, a treasure to discover. International Committee for Education on the 21 Century report for Unesco", coordinated by Jacques Delors, drew attention to the impact that ICT's may have in renovating the Educational System, as to the response they must provide to the multiple challenges of the Information Society, recommending that "educational systems must provide an answer to the multiple challenges of information societies, in a continuous enrichment of knowledge and the exercise of a citizenship adapted to the demands of our time perspective" (Unesco, 1996).

In June, 2008, a report was published by *The International Society for Technology in Education*, where the new National Standards in Educational Technology, aimed at teachers, were presented. (ISTE, 2008a) In that document, new recommendations are made to teachers, in the manner as to make them accountable for their part as creators of pedagogical experiences involving the use of technologies to learn and teach.

Although teachers recognize the value of ICT's in education, there are still some barriers for its effective use. Thus, in 2006, in the Report on the Impact of ICT's in European Schools (Europeen Schoolnet, 2006), these barriers were identified, being divided in three categories: i) teacher level barriers – meaning those that are related directly with the approach and attitude relating to ICT's by the teacher; ii) school level barriers – the absence and low quality of infrastructures, the limited access to technological equipment, low levels of participation in technological projects by the school and the absence of ICT's integration in school strategies; and iii) educational system level barriers – strict structure of the traditional school system and the existence of rigid curricula (Europeen Schoolnet, 2006).

In this paper we reflect on the impact of ICT in educational systems, and the importance of preparing Portuguese teachers to the challenges of the learning society. In order to contribute for the definition of a national program for the professional development of teachers in ICT, we present some international programs for the professional development of teachers in ICT discussing results on current implementation.

We then present the recently launched Portuguese Plan of ICT Competences for teachers that define different levels of teacher digital literacy and ways to get a certification. In order to add new insights into current discussion on this topic, we present a review of literature on a theoretical framework that has shown effective for the integration of ICT into the classroom: the TPACK. Examples of successful experiences in different curricular areas already implemented and tested will be presented and discussed in order to help Portuguese teacher educators in the design of teaching activities to be carried out in education programs for in service teachers.

INTERNATIONAL PROGRAMS FOR TEACHER EDUCATION ON ICT

With the objective of trying to overcome the existing barriers in School, and facing the importance of developing and certifying teachers competences in ICT, many international organizations have produced standards that became the base for the teacher's formation and certification processes.

The European Computer Driving Licence (ECDL Portugal, 2010) is an ICT competences certification model, for many users, allowing the identification of competences and knowledge of each user, in the efficient use of the main computer applications. The qualification is acquired by passing an exam created around the contents of seven formative modules: introduction to computers, computer use and file management, text processor, spreadsheets, databases, presentations, and Internet and e-mail. Although this model "simplifies the certification, and internationalizes it, the detachment from the teacher's professional situation, from the national reality, are some of the critical points in this model" (GEPE, 2008).

The International Society for Technology in Education (ISTE, 2008b) has produced a generic standard and a group of specific standards for teacher's formation and competences on use of ICT certification programs. This project arose from the analysis of a questionnaire given in the USA about what should teachers know about ICT and what should they be capable of doing with them, so they could improve efficiently the learning of their pupils. This standard is organized in five dimensions: i) Facilitate and Inspire Student Learning and Creativity; ii) Design and Develop Digital-Age Learning Experiences and Assessments; iii) Model Digital-Age Work and Learning; iv) Promote and Model Digital Citizenship and Responsibility; v) Engage in Professional Growth and Leadership. This standard allows integration of both technical and pedagogical competences, allowing for change and autonomy in the building of knowledge, as for creativity from both teachers and students.

The project ICT Competency Standards for Teachers (UNESCO, 2008), is based in the assumption that the use of ICT in education will contribute to the improvement in education, thus being presented as a central factor in educational, social and political progress. This project incorporates the educational principles in de ISTE developed standard, arguing that teachers are responsible for developing ICT competences in students as well as access, selection and organization of information and communication, also being capable of solving problems and act creatively. This standard is constituted as an array of ICT competences: political vision, curricula and evaluation, pedagogy, ICT, organization, administration and professional development of teachers. This standard aims to be the basis for benchmarks and specific indicators in three approaches: i) digital literacy approach, ii) knowledge increase approach, iii) knowledge creation approach. It also attributes ICT with the role of changing the educational practices, because of their educational, curricular and administrative integration within schools.

Finally, the Smart Classrooms Professional Development Framework (Queensland Government, 2009) is part of a government plan to improve student, teacher and schools learning, from Queensland Government, in Australia. This standard has a common objective: serve as a standard for teacher's work, in order to achieve improvement in learning results and social improvement, acting as an impetus to the development of teacher's skills, so he can be an agent in the transformation of the teaching and learning process, in all levels of education. It also encourages the use of new methods, integrating ICT and pedagogy, with the objective of improving learning and student results. This standard has three levels of certification: ICT Certificate, Digital Pedagogy Licence and Digital Pedagogy Licence Advanced. ICT Certificate recognizes basic teacher skills in a learning context. Digital Pedagogy Licence recognizes the digital skills of teachers that use ICT in a way to improve the teaching and learning process. Digital Pedagogy Licence Advanced certifies the digital skills of teachers who are leading the transformation of the learning process through use of ICT.

Although many strong points have been found in both these standards, contextual reasons advise against adoption of any of these standards to the Portuguese reality. These reasons go from the educational models and teacher training reasons to questions of institutional, administrative and political order. The PTE proposal is based on the international view of the role of ICT, the teacher's role as a user of digital technologies in a responsible and educational interesting way, the objectives proposed for the PTE, as well as the situation in which schools work in our country (GEPE, 2008).

THE PORTUGUESE PLAN OF ICT COMPETENCES FOR PORTUGUESE TEACHERS

The "ICT Skills" project is the "cornerstone of the strategy for teacher training in innovating their educational practices with the help of information and communication technologies", developing a training and certification system in ICT skills, in order to recognize ICT skills of at least 90% of teachers (GEPE, 2008).

In the Implementation Study for the "ICT Skills" Project (GEPE, 2008), and so that teachers acquire the skills of Teacher of the 21st Century, as defined in the study, a continuous formation model was proposed, taking into account the regulations that govern the professional activity of teachers. In order to enable the application of skills this formation ensues, some recommendations were defined: i) the need to integrate ICT through all school life, so as they are naturally perceived, ii) the need to ICT are a part of all subject areas, iii) the need for quality resources, diversified, and adequate to the development of curricula, iv) the need for adequate infrastructure, fit for the demands of teaching work with ICT, v) the need for the direction of school boards to develop a clear leadership, encouraging the use of ICT.

Through Decree No. 731/2009, of July, 7, the Portuguese Government creates the normative conditions to execute the teacher ICT skills training and certification program, with the objective of: i) promote the generalization of digital and educational skills with the use of ICT, ii) provide ICT training in a coherent and articulate manner, iii) recognize ICT skills acquired outside the continuous teacher training framework.

Thus, the ICT skills training courses were organized in three levels: level 1 – digital skills training; level 2 – educational and professional skills with ICT training; and level 3 – advanced ICT skills in education training. The training course in digital skills (level 1) is composed by one of three alternative courses defined in the Decree. The training course in educational and professional skills with ICT (level 2) is composed by two mandatory training courses and two optional training courses. Finally, the advanced ICT skills in education training course (level 3) is composed by master and doctorate programs, run by higher education institutions.

In parallel with these training courses, three ICT Skills certificates where created, so the knowledge acquired by teachers could be certified: i) Digital skills certificate – this certificate recognizes the knowledge acquired by the teacher that allow him to use ICT in teaching and learning processes, being assigned by the recognition of acquired skills, namely by validation of professional or associated skills, or by recognition of his formative history; ii) Educational and professional skills with ICT certificate – certifies the acquired knowledge of teachers that incorporate ICT in their practices, exploring them as an educational and pedagogical resource, and mobilizing them to developing new teaching strategies. Assigned through recognition of formative paths and in sequence of a positive evaluation of the teacher's digital portfolio; iii) Advanced ICT skill in education certificate – recognizes the acquired knowledge that enables the teacher to innovate in his educational practices, manage and think about his experiences, in an investigative manner and with the objective of sharing and cooperation with the educative community. Assigned to teachers who have a masters or doctorate degree in the Educational Sciences area.

Issuing of these certificates is responsibility of the director of the training centre from the schools association, after application from the teacher, submitted to the director of the school group where he is working.

Although the ICT Skills Plan defines a basic framework for teacher ICT certification, there still much to do to establish what will be the practice of training in the field. In fact, more important than certifying is to make sure teachers actually use ICT as real educational tools in the classroom, capable of helping students building knowledge (Jonassen, 2007). Also, as suggested by Baylor and Ritchie (2002), continuous formation of teachers in the ICT level should enable teachers with "the opportunity to learn and observe new teaching with ICT methods, share questions and problems with others, and explore new ideas with experts and peers" (Baylor & Ritchie, 2002, p. 410). This same idea of importance in the sharing of experiences and worries with the peers, meaning what we could call a "cooperation culture" between teachers, constitutes a professional development strategy that encourages teachers to think about the practices, to a peer shared learning that promotes multiple skills and a genuine desire for change (Hargreaves, 1998).

On the other hand, integrating technology in the classroom is more effective when the learning is significative, that is, when teachers are capable of linking contents with teaching processes, in a way that promotes the learning from students in the content itself (Jonassen, Howland, Marra & Crismond, 2008). TPACK is a very recent theoretical standard that arose from the need to answer efficiently the question of how to integrate ICT in the curricula as an efficient learning tool. It seems to us important and timely to present this theoretical standard and what investigation shows about its implementation in the educational field; it will be a way to give some practical clues to the implementation of an ICT skills standard and contribute for Portuguese teachers definitively integrate ICT in their curricula.

THE TPACK MODEL

The Technological Pedagogical Content Knowledge, TPACK for short, has revealed itself as the theoretical standard of excellence for an effective integration of ICT in the teaching and learning processes (Graham, Burgoyne & Borup, 2010). The basic premise where it stands assumes that the teacher's attitude when it comes to technologies is multi-purpose and that an optimal combination for its integration in the curricula results of a balanced mix of scientific (or content) knowledge, educational knowledge and technical knowledge (Koehler & Mishra, 2008).

Shulman (1986) developed a theoretical framework for teacher education by introducing the concept of pedagogical content knowledge (PCK). Shulman argued that a distinctive form of teacher-practitioners' professional knowledge, which he referred to as PCK, exists and this knowledge builds upon, but is different from, subject matter knowledge. In Shulman's view, PCK is a form of practical knowledge that is used by teacher practitioners to guide their actions in highly contextualized classroom settings. This form of practical knowledge involves for one hand an understanding of how to structure and present the subject matter to be learned, on the other hand an understanding of the common conceptions, misconceptions, and difficulties that learners encounter when learning particular subject matter, and finally knowledge of the instructional strategies that are effective at addressing students' learning needs in particular classroom circumstances. According to Shulman, PCK builds on disciplinary knowledge and is, therefore, a critical constitutive element in the knowledge base of teaching within a specific discipline.

Mishra & Koehler (2006), enhancing Shulman's (1986) theoretical standard, added Technology as an integrated component of teacher's knowledge as to teach in a more effective way, so creating the above described TPACK. In this new standard, the combination of content, education and technology forms "an integrated whole, a 'Total PACKage' as it was, for helping teachers take advantage of technology to improve student learning" (Thompson & Mishra, 2008, p. 38).

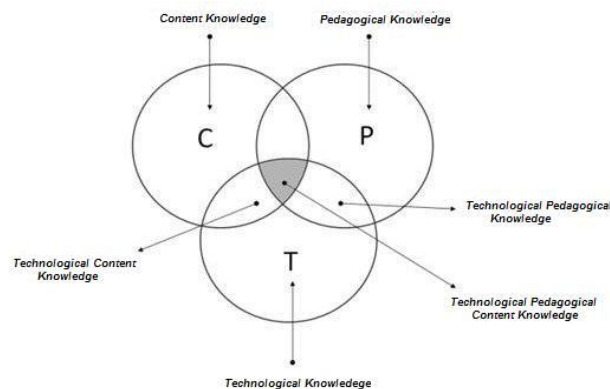
Figure I, adapted from Koehler & Mishra (2008) represents the concept of TPACK in a graphical way as being the result of intersecting the teachers' knowledge in three levels: curricula and content knowledge, education methods knowledge, and technological skills.


Figure I: TPACK Model

In theoretical terms and according to Koehler and Mishra (2006, 2008), TPACK results of the intersection of three different types of knowledge:

- Pedagogical Content Knowledge: meaning the ability to teach some curricula content;
- Technological Content Knowledge: meaning the ability to select the most adequate technological resources to communicate some curricula content;
- Technological Pedagogical Knowledge: meaning knowing how to use those resources in the teaching and learning process.

The TPACK concept, for Harris and Hoffer (2009) is an amplification of the pedagogical content knowledge concept presented by Shulman in 1986, and one that, in a way, revolutionizes the form as, today, the professional development of a teacher that is a competent one in his teaching area is processed.

The accelerated advance of computer and Internet use as support tools for the teaching and learning process require the need for a framework that supports those what must be the skills for a teacher that uses ICT as educational tools in the classroom, as stated by Jonassen (2007).

According to Koehler and Mishra (2008), TPACK is the basis for effective use of technology in teaching, and a condition for efficiently inserting ICT in the learning activities. Deep understanding and mastery of teaching techniques are needed so that technology is used to build knowledge by the student and not as support for the teacher to teach. This way, according to the same authors, teacher training must be steered to development of TPACK in a gradually and spiraling way, starting with the simpler technologies that teachers already know (and for which they may already have skills in the TPACK level), in the way to ever more complex and sophisticated applications. The main objective is that the teacher is enabled to make informed decisions in the planning of his teaching with technologies activities, which implies:

- Choosing teaching objectives;
- Decision making in the pedagogical level, taking into account the learning experience;
- Selecting and sequencing the teaching activities;
- Selecting the formative and summative evaluation strategies adequate to the adopted pedagogical strategy;
- Selecting the best resources and tools to help students benefit from the planned learning activities.

DEVELOPMENT OF TPACK IN EDUCATIONAL SCENARIOS

Use of TPACK as a theoretical framework has increased in the last few years, as it proposes a structured approach to the complex nature of ICT and teaching (Cox, 2008). In the last few years we saw the emergence of several studies, which want to investigate the development of TPACK in educational scenarios.

The investigation developed by Figg and Jaipal (2009) disassembles TPACK, focusing in the Technological Knowledge components: Technological Knowledge, Technological Content Knowledge and Technological Pedagogical Knowledge, so that it provides the operational definitions of those components. Furthermore, concrete examples are presented, that may be used to obtain effective integration of technology in the classroom context, as well as to highlight the influence that Technological Pedagogical Knowledge has in the successful implementation of technology in the educational practice of future teachers.

In 2006, Norway performed a curricula reformulation – The Knowledge Promotion – using TPACK as basis for the project, where teachers cooperated with other teachers, the school administration and students. This reform arrived from the need to alter the way the majority of teachers used ICT, through intensive training processes, in a way to enhance their TPACK. The main objective was that students acquired basic digital literacy skills, so they could actively participate in the knowledge society, including the capacity for ICT use (Engelien et al., 2009). In the end of these processes and modifications, they came to the conclusion that digital literacy must be implemented in all curricula, thus being considered as important as reading and writing (Krumsvik, 2008 cit. Engelien & Stundal, 2010). "They went from being primarily digitally illiterate to being representatives for good teaching with technology" (Engelien & Stundal, 2010). Although the final objective is the development of a system or organization, the participants are people, driving to that a personal mastery is need to change practice, among school directors, teachers and students. Teachers' TPACK is vital so that the proposed objectives are achieved, among them digital literacy, one of five basic skills.

Engelien, et al. (2009) analyzed this reform, using the TPACK model to explain how complex objectives may be segmented, worked on thoroughly and again reunited. In the analysis they concluded that this reform allowed thinking and development of knowledge about the use of technology in school. Also concluding that TPACK has a useful framework that helps to understand the complexity of the demands made to teachers.

Other investigations were performed in more specific curricula. In the Geography area, Doering & Veletsianos (2009) designed three educational online environments to help students and teachers on effectively using geospatial technologies in the classroom context. These environments are built to help teachers with a limited formation in teaching Geography through technology, using TPACK as basis for their investigation. In Mathematics, use of TPACK has been the target for some studies. Niess (2008) does an analysis on the efforts taken by other investigators directed to the preparation of Mathematics teachers on teaching with technologies. This study concludes that, to the majority of teachers, teaching in a work context gives them the opportunity of teaching in the 21st century, because if education must adapt and prepare their students to live and work in the 21st century, teachers need to be prepared to integrate emerging technologies as learning tools. New programs and training must guide them in learning about ICT, training them in teaching new curricula, at the same time using technology, and guiding the development of student understanding. "This in-service education needs to focus on developing and extending the knowledge, skills and dispositions described in TPACK (Niess, 2008). Schmidt, Seymour, Sahin & Thompson (2008) have also reflected about TPACK development in PreK-6 Teachers. To these investigators, TPACK acts like a new form of knowledge that requires teachers not only to understand the complexity of relations between

technology, pedagogy and content, but also propose solutions for their practices. Also Bauer (2010) reflects on the use of TPACK with Music teachers, since, and taking into account the use of technology theme has been a very interesting topic among music teachers, they still don't use the technology in the classroom intensively. This investigator proposes a research-base conceptual framework for pre-service and in-service music educators. He concludes that music teachers should be open to new ideas and ways of doing things, and demonstrate the will to use a convergence between technology and musical pedagogy.

With the advance in the various investigations, some activities to bring closer the integration of technology in education have been presented. Hofer et al. (2009) developed and executed six activities to the K-6 literacy, secondary English, foreign language, mathematics, science and social studies areas, showing who they can help teachers develop student knowledge by integrating technology. These activities focus in raising awareness for all possibilities of technology support in specific curricula. At the same time, they aim to help teachers in choosing and combining different learning activities so that students are helped to acquire the basic skills in the matter, taking into account the learning needs and preferences of the students. This investigation suggests that, only when teachers are familiar with a full range of learning activities types inside a specific content, they can wisely choose and execute in an effective way the adequate activity. The six learning activity types introduced represent the effort of the authors to identify the different types of learning activity in the diverse curricula areas, so that educational technology may be used as support for teaching and learning

The investigation made by Harris and Hofer (2009) also presents diverse activities for the use of ICT, based on TPACK. These activities work as conceptual planning for teachers. "Each activity type captures what is most essential about the structure of a particular kind of learning action as it relates to what students do when engaged in that particular learning-related activity" (Harris & Hofer, 2009). Thus, they propose a taxonomy, from their studies. They divide these activities in seven types:

i) knowledge building activity types – example given: read text, view presentation, group discussion, field trip, etc.;

ii) convergent knowledge activity types – answer questions, create a timeline, a map, complete charts, take a test, etc.;

iii) written divergent knowledge expression activity types – write an essay, a report, craft a poem or a diary, etc.;

iv) visual divergent knowledge activity types – create a picture or a mural, an illustrated map or draw a cartoon;

v) conceptual divergent knowledge expression activity types – develop a knowledge Web, generate questions or develop a metaphor;

vi) product-oriented divergent knowledge expression activity types – produce an artifact, build a model, create a newspaper, etc.;

vii) participatory divergent knowledge expression activity types – do a presentation, do a performance, engage in historic play or engage in civic action.

In the knowledge building activity types, teachers have a variety of activities that allow to enable students in the social studies content building and process knowledge. Through expressions of knowledge analysis, teachers can determine what students learnt. These activities may be combined so plans can be created for use in a specific class. When teachers are familiar with these activities, they can choose, combine and use effectively these activities to develop learning situations, thus building their TPACK in a practical way (Harris & Hofer, 2009).

FINAL REMARKS

In this paper we presented a review of the research that intends to give new insights in the process of the implementation of a national program for the professional development of teachers in Portugal. After discussing several European programs that were recently developed we present the framework that was created for the certification of Portuguese teachers in ICT.

However, if certification is important, even more important is to design effective programs that prepare teachers to empower students with the advantages that technology can bring to any citizen of our global society. This requires teachers that integrate the technologies as cognitive tools in the daily classroom routines. The TPACK model as shown to be one of the most relevant theoretical frameworks for the design of effective training programs for teachers in ICT, because it faces an holistic development of teacher knowledge – content, pedagogy and technology – that is crucial for the integration of the technologies into the curriculum.

Abstract: Society has become more complex in recent decades, and this has increased the demands placed on the educational system and the teaching profession. This study focuses on the development and validation of an instrument that explores the basic skills of beginning teachers. The instrument was developed according to scientific knowledge on teacher skills and their legal context as described by the Flemish government. Teacher competencies are measured along three dimensions: behaviour, capability and beliefs. Construct validation took place in two rounds, using data obtained from a survey of beginning secondary teachers that was conducted in September 2008 and June 2009. Exploratory factor analyses with oblique rotation resulted in 12 reliable scales, containing a total of 60 items. The instrument can be used in teacher-training institutes to explore the basic skills of graduating students and in schools to initiate a process of reflection amongst beginning teachers.

Keywords: teacher professionalisation, beginning teachers, teacher competences

INTRODUCTION

Researchers, policy makers and teacher educators all recognise that the process of becoming a teacher should involve lifelong learning (Tichenor & Tichenor, 2004; Wong, Britton, & Ganser, 2005). The educational system is confronted with increasing and constantly changing requirements, which affect the day-to-day work of teachers in the classroom. Becoming a teacher is thus a permanent learning process, a succession of formal and informal learning experiences (Clement & Staessens, 1993). In accordance with Clement and Vandenberghe (2000), the professional development of teachers is actually related to helping teachers gain more control of their own behaviour. It improves their ability to respond to changing circumstances and to justify their professional behaviour.

The development of teacher professionalism does not end when students complete their teacher-training programmes; it continues after graduation. Teacher training obviously does impart a number of key competences or basic skills. The training courses should ensure that each graduate has at least the minimum competences necessary to enter the teaching profession. Thereafter, induction programmes in schools and additional training (in-school and external) help both experienced and beginning teachers to achieve full competency (Feiman-Nemser, 2001; Morberg & Eisenschmidt, 2009).

This view on the professional development of teachers justifies a distinction between expectations that apply to newly-trained or beginning teachers and those that apply to more experienced teachers. A level of professionalism appropriate to an experienced teacher cannot be expected at the beginning of a teaching career (Schepens, Aelterman, & Van Keer, 2007). In Flanders (Belgium), there is a legal distinction between the basic skills required of beginning teachers and those required of more experienced teachers. The list of basic skills specifies a clear set of knowledge, skills and attitudes that graduates of teacher-training programmes should possess in order to function properly as a beginning teacher (Ministry of the Flemish Community, Department of Education, 2007). Similar to the vocational profile of an experienced teacher, the list of basic skills provides a clear and current description of what the government expects of a teacher; the skills are derived from policy objectives and the needs of society.

To date, there are no validated instruments to measure the basic skills of beginning teachers. The aim of this research is to develop and validate such an instrument. The instrument is based on contemporary scientific knowledge on teacher competences, and it draws upon the Flemish government's description of teacher competences.

THEORETICAL FRAMEWORK

The basic skills of beginning teachers in Flanders (Belgium)
In 1998, the Flemish government ordered the development of a vocational profile and a list of basic skills to serve as quality standards for teacher-training programmes. These profiles were updated in 2007 (Ministry of the Flemish Community, Department of Education 2007). The competences included in the vocational profile and the related basic skills are categorised into ten functional roles that teachers perform. These roles are grouped into three clusters of responsibilities (Ministry of the Flemish community, Department of Education, 2007).
The first cluster includes the responsibilities of teachers with regard to their students. Five roles can be distinguished in this cluster: (1) source of support for processes of learning and development; (2) educator; (3) content expert; (4) organiser and (5) innovator and researcher. The second cluster comprises the responsibilities of teachers with regard to the school and the educational community. The teacher's roles within this cluster are as follows: (6) partner of parents or guardians; (7) member of the school team; (8) partner of external entities and (9) member of the educational community. The final cluster involves the responsibility of teachers with regard to society. This responsibility is included within the following role: (10) member of society.
The vocational profile and the basic skills that are derived from it assume a comprehensive and extended professional orientation to teaching: a teacher's task is not limited to activities in the classroom; it also incorporates responsibilities with regard to the school and society in general. Cooperation and a strong commitment to interdisciplinary and extra-curricular activities in the school are considered important aspects of teaching. Classroom activities should also be adapted to school policy and related to new educational insights and recent developments in society (Jongmans, Biemans, Sleegers, & De Jong, 1998).

Measuring competencies
Each role in the list of basic skills is described in detail using a series of competences ('*the teacher can ...*'). For each competence, the underlying knowledge base (i.e. *what the teacher has to know in order to achieve this competence*) is also explicitly mentioned. In addition to the ten roles, eight teaching attitudes are distinguished: decision-making ability, relational orientation, critical attitude, desire to learn, organisational ability, sense of cooperation, accountability and flexibility. After profound study of the detailed list of skills, knowledge elements and attitudes, we concluded that they were not suitable for inclusion in a questionnaire in their current form. The list was too detailed, and the artificial unravelling of the teacher's tasks had led to overlaps between the different roles in some cases. In addition, the relatively general and often theoretical formulation of the basic skills and the attitudes made them less suitable for inclusion in a questionnaire. Selection and a more specific operationalisation appeared necessary. To find ideas for performing this task, we consulted literature on the concerns (e.g. Watzke, 2007), self-efficacy (e.g. Skaalvik & Skaalvik, 2007) and well-being (e.g. Veenman, 1984) of teachers, as well as literature on reasons for leaving the teaching profession (e.g. Kersaint, Lewis, Potter, & Meisels, 2007). Each of these lines of scientific research indicates a limited set of key skills that beginning teachers need to master in order to manage themselves in educational settings, to feel qualified as teachers and to stay motivated. This yielded a classification comprising 10 relevant areas of interest: lesson preparation, lesson implementation, differentiation, evaluation of students, the teacher as an educator, classroom management, the teacher as a member of the school team, the teacher as a member of society, use of communication/language and professional development. Specific items were formulated for each of these areas of interest.
After identifying this limited set of areas, we determined the form in which the items should be presented to teachers, with the goal of attaining a thorough assessment of their competence in each area of interest. According to Miller (1990), who studied the competences of medical students and how to evaluate them, a competence has been mastered when the practitioner *applies* it in daily practice. In order to reach this level of performance, individuals must attain a set of knowledge and skills that will allow them to use this knowledge. Corresponding to Miller, the competence model of Korthagen (2004) also considers a person's behaviour in daily life as the highest expression of a competence. Various elements underlying an individual's behaviour become apparent, much like the layers of an onion. The *behaviour* of individuals is partly determined by their *skills*, which are subsequently influenced by their *beliefs*. People's beliefs are then determined by their *identity*. Individual *involvement* is at the centre of the competence model. Korthagen (2004) defines involvement as the personal mission that individuals pursue in their lives or their work. Finally, people's behaviour is affected by the context or environment in which they function. With regard to teacher competences, a specific school or classroom context influences whether or not a teacher's behaviour

is considered competent. Using the findings of Miller and Korthagen regarding the assessment of competences, we decided to have beginning teachers score items along three dimensions: behaviour, capability and beliefs.

METHODOLOGY

Construction of the research instrument
The questionnaire was developed into two stages. For each area of interest, six to twelve items were formulated. The first version of the questionnaire was discussed in three separate focus groups, one with beginning teachers (n = 7), one with tutors (n = 7) and one with lecturers (n = 3). The importance of the ten areas of interest was examined, as well as the clarity and relevance of the specific items and the coverage of the items in each area of interest. All of the focus-group participants considered the ten areas of interest important and sufficiently broad; 21 items were updated, 6 were added and 4 were removed. This produced a questionnaire consisting of 76 items. Each item was examined according to three aspects. *Behaviour* (a) refers to the actual performance of the item in daily practice; we consider behaviour as the highest expression of a competence. *Capability* (b) refers to the manner in which individuals consider themselves capable of carrying out the competence. *Beliefs* (c) refer to the degree to which individuals consider the competence important. These three different aspects are assessed using a Likert scale consisting of five response categories (see Table 1).

Table 1: Sample items and the response categories used

Varying objectives according to differences between students.

Data collection and respondents
The instrument was distributed electronically to beginning teachers in regular secondary schools in Flanders (Belgium). The coordinating directors of the 54 school communities (each of which includes multiples secondary schools) in Flanders were asked to participate in this study. After accepting the invitation, each school was asked to transmit a list of its beginning teachers. Beginning teachers were defined as individuals in their first year of teaching. This yielded a list of 815 teachers from 50 school communities. In September 2008, an e-mail was sent to the beginning teachers asking them to complete the questionnaire electronically. The questionnaire was ultimately completed by 559 teachers, representing an average of 11 (SD = 8.91) teachers from each school community (response rate for teachers: 69%, response rate for school communities: 100%). At the end of the same school year (June 2009), the beginning teachers were once again asked to complete a slightly revised instrument. This questionnaire was completed by 208 teachers, representing an average number of approximately 5 (SD = 3.69) teachers from each school community (response rate for teachers: 26%, response rate for school communities: 88%).

The dataset was screened before the analyses were started. Only data from teachers who indicated that they were in their first year of professional teaching were retained. In September, 108 participants indicated that they had been teaching for more than one year (e.g. in another school); these responses were deleted from the dataset. Of the 451 remaining respondents, 66% were women, and the average age was 26 years and one month (SD = 6.71). In June, 48 participants indicated that they were not beginning teachers. As with the previous sample, 66% of the 160 remaining respondents were women. The average age of respondents in the second sample was 27 years and five months (SD= 7.44).

Analyses
The construct validity of the questionnaire was tested in two rounds. The *first validation* was conducted on the data collected in September 2008 (sample size: n = 451). Given the size and complexity of the instrument (76 items, each assessed according to three aspects), we decided to divide the questionnaire into two groups of items and to validate the instrument successively for each aspect (i.e. *behaviour*, *capability*, *beliefs*). Based on the aforementioned literature on narrow and extended professional orientations of teachers, we grouped the 49 items referring to teaching and educational practice in the classroom during the initial factor

analysis. A second factor analysis was conducted on the remaining 27 items, which refer to interdisciplinary and reflective practice. Because dependency was assumed between the different areas, oblique rotation was used. The exploratory factor analyses were conducted on the dataset for the dimension of behaviour.

The selection of the number of factors was based both on the Eigenvalues-greater-than-one method (the Kaiser-Guttman rule) and on the interpretability and integration of the scales within the theoretical framework (Bandalos & Boehm-Kaufman, 2009). The retained items within a factor had to meet the following criteria: (1) factor loading equal to or higher than |.30|, and (2) meaningful content corresponding to the factor. Finally, the number of items in each factor was taken into account. As a rule, a factor should contain at least four items in order to reflect the complexity of the latent construct sufficiently and to become a scale. The item loadings for the aspects of *capability* and *beliefs* in the corresponding factors (in accordance with the aspect of *behaviour*) were subsequently investigated. To achieve adequate parallelism in the questionnaire, the retained items had to load sufficiently ($\geq |.30|$) on the relevant factor for the three aspects (*behaviour*, *capability* and *beliefs*).

Finally the reliability of the questionnaire was considered by analysing the Cronbach's alpha scores of the constructed scales. We considered reliability coefficients approaching .70 as sufficiently reliable (Schmitt, 1996). In this stage, items could still be removed if doing so would increase the reliability of the scale.

The second construct validation (using factor analysis with oblique rotation) was conducted on the data collected in June 2009 (sample size: n = 160). Because the first validation had led to a few adjustments of the questionnaire (see Results), a second validation was carried out to determine whether these changes increased the reliability and the usefulness of the scales. In the second round, we conducted a confirmatory factor analysis, taking the results of the first factor analyses into account.

RESULTS

A six-factor structure emerged as a result of the factor analysis with oblique rotation on the 49 items regarding teaching activities in the classroom. Each of these six factors contained at least four items with loadings of |.30| or higher. In terms of content, the six factors were well interpretable. Taken together, the six underlying factors described 44.87% of the total variance. The results of the factor analysis with oblique rotation on the 27 items regarding interdisciplinary and reflective practice for the aspect of behaviour initially produced an 8-factor structure. We nonetheless decided to preserve a six-factor structure, as one factor contained only two items and the content of another factor (3 items) was difficult to interpret. The six factors together explained 53.31% of the total item variance. We subsequently examined whether the retained items of the twelve factors also loaded significantly on the other two aspects (capability and beliefs), thus guaranteeing full parallelism in the questionnaire. Based on these analyses we concluded that, with one exception, the various items loaded at |.30| or higher on the relevant factor, for the aspect of capability as well as the aspect of beliefs. One item did not load high enough (.27) on the factor 'Involvement and flexibility' for the aspect of beliefs, and it was therefore removed.

To provide an adequate reflection of the complexity of the underlying concepts, we attempted to generate scales consisting of at least four items. We therefore decided to formulate one or two new items for each scale with less than 4 items. We also refined the wording of two items. For example, the item, '*Forming an opinion on educational topics in discussion with colleagues*' was revised to read, '*Forming an opinion on current educational issues*'. These additions and adjustments were intended to increase the cohesion between the items within the same scale. The second version of the instrument consisted of 63 items; 35 items refer to teaching and educational practice (6 scales) and 28 items (also 6 scales) describe interdisciplinary and reflective practice. The modifications that were made in the formulation of the items and the addition of nine new items regarding multidisciplinary and reflective practice required an additional validation. Confirmatory factor analysis with oblique rotation (using the underlying six-factor structure from the first validation round) showed that all six of the factors had an intrinsic value greater than one, together explaining 64.02% of the total variance in the data. At the item level, one item had a loading lower than |.30| and two items had loadings of |.30| or higher on more than one factor. These items were removed.

Table 2 shows the scales, the final number of items for each scale and the results of the reliability analyses for behaviour, capability and beliefs separately.

The scale '*Care for each student*' (6 items) describes the extent to which teachers attend to the welfare of their students, consider the cognitive potential and the personality of each student and invest in positive relationships with their students. The scale '*Involvement and flexibility*' (5 items) represents the extent to which teachers pay attention to motivating students by carefully determining the content and working format of the lessons. The items also describe the extent to which teachers handle their lesson preparations in a flexible manner (e.g. by creating possibilities for students to provide input). The scale '*Differentiation*' (5

items) describes the extent to which teachers differentiate in the classroom in terms of content and pace, thereby managing to challenge all students. The scale '*Incorporating current events and diversity*' (8 items) describes the extent to which teachers consider the interests and needs of their students when selecting content and teaching materials. The items also address the extent to which teachers include current events in their lessons. The scale '*Classroom discipline*' (5 items) describes the extent to which teachers manage to keep the classroom under control and are capable of intervening in situations involving disruptive behaviour. The items also describe the extent to which teachers teach their students values (e.g. responsibility and respect). The scale '*Evaluation*' (6 items) describes the extent to which teachers pay attention to evaluation, observe/track the progress of their students and provide them with feedback.

The scale '*Reflection on teaching*' (5 items) defines the extent to which teachers reflect on their own teaching. The scale '*Communication with parents*' (3 items) describes the way in which teachers communicate with parents and the extent to which they provide information about the children in a comprehensible manner. The scale '*Reflection with others*' (4 items) describes the extent to which teachers reflect on their teaching practice with others (e.g. colleagues). The scale '*Awareness and accountability*' contains four items, which describe the extent to which teachers act as members of the educational community. In other words, it describes the extent to which a teacher has developed a responsible teaching style by considering social issues and current events. The scale '*Innovation*' defines the extent to which teachers are open to innovation (e.g. by staying informed on innovations and incorporating them into the lessons). The final scale '*Member of the school team*' (4 items) addresses the extent to which teachers cooperate and confer with their colleagues and contribute to the group spirit within the teaching staff.

Reliability coefficients range from .72 to .86 for the aspect 'behaviour', from .72 to .88 for 'capability' and from .66 to .90 for 'beliefs'.

Table 2: BeTeBaS-instrument: scales, sample items, number of items and reliability coefficients (α) for behaviour (*Beh*), capability (*Cap*) and beliefs (*Bel*).

Scale	Sample item	Items	α		
			Beh	**Cap**	**Bel**
Care for each student	Taking the personality of each student into account.	6	.81	.84	.78
Involvement and flexibility	Allowing students to provide input during lessons	5	.74	.74	.67
Differentiation	Considering differences in tempo between the students	5	.79	.82	.80
Incorporating current events and diversity	Incorporating current events into my lessons	8	.72	.72	.68
Classroom discipline	Addressing disruptive behaviour from students	5	.76	.88	.71
Evaluation	Varying my methods of evaluation	6	.72	.76	.66
Reflection on teaching	Knowing after a lesson why some things worked and why others went less smoothly	5	.86	.88	.90
Communication with parents	Providing parents with coherent information about their children	3	.82	.81	.82
Reflection with others	Reflecting with others on my actions in the classroom	4	.82	.85	.82
Awareness and accountability	Forming an opinion on current social issues and developments	5	.74	.78	.71
Innovation	Experimenting with new insights in my teaching	4	.81	.79	.86
Member of the school team	Asking my colleagues for advice	4	.80	.83	.80

For a more detailed description of the successive factor analyses and a full version of the BeTeBaS-questionnaire we refer to Struyf, Adriaensens, and Meynen (in press).

CONCLUSION

Based on a study of beginning secondary teachers, we constructed a reliable and construct valid instrument to assess the basic skills of beginning teachers according to three aspects: behaviour, capability and beliefs. The BeTeBaS-instrument (BEginning TEachers' BAsic Skills) consists of 60 items, divided in 12 reliable scales that refer to teaching and educational practice and to interdisciplinary and reflective practice. The

reliability coefficients of the 12 scales approached or exceeded the value α = 70 (Schmitt, 1996), and this applies to the aspects of behaviour, capability and beliefs. In order to provide an adequate reflection of the complexity of the latent construct, all but one of the scales contain a minimum of four items.

The first six scales measure aspects related to teaching and educational practice in the classroom. The first scale, 'Care for each student' is consistent with the role of 'the teacher as educator' (Ministry of the Flemish Community, Department of Education, 2007). Teachers must develop the ability to create a positive classroom climate. The scale 'Involvement and flexibility' - representing the ability of teachers to motivate their students by using active and flexible teaching methods - corresponds to the role of 'the teacher as organiser', which represents the ability of teachers to create smooth and efficient lessons in a stimulating learning environment. The 'Differentiation' scale describes the extent to which teachers differentiate in terms of content and pace, thus managing to challenge all of their students. The ability to differentiate is mentioned in the role of 'supporting the learning and development processes'. The scale 'Incorporating current events and diversity' is closely related to the fourth scale. It describes the extent to which teachers take student diversity into account. The role of 'supporting processes of learning and development' also includes the ability to handle student diversity. Schools can be seen as miniature societies that reflect the larger society, which is increasingly confronted with diversity in terms of ethnicity culture and religion, as well as social and economic status. One aspect of the scale 'Incorporating current events and diversity' can also be found in the role of 'the teacher as an educator': teachers should incorporate actual social developments into their lessons. The 'Classroom discipline' scale describes the ability of teachers to manage their classrooms and control disruptive behaviour, as described in the role of 'the teacher as organiser'. The sixth scale, 'Evaluation' measures the ability of teachers to evaluate students, monitor student progress and provide feedback. This scale is closely related to the role of 'supporting processes of learning and development'.

The six scales related to the teaching and educational practice of beginning teachers correspond to the concerns of student teachers and beginning teachers with regard to the socio-emotional growth of students, dealing with the problems and needs of individual students, motivating students, managing the classroom and evaluating students' class work (Reeves & Kazelskis, 1985; Veenman, 1984; Watzke, 2007).

Six other scales describe the interdisciplinary and reflective practice of beginning teachers. The scale 'Reflection on teaching' and the scale 'Reflection with others' are related to the 'critical attitude' of teachers (Ministry of the Flemish Community, Department of Education, 2007). Louis, Kruse, and Bryk (1995) refer to such consideration and examination of educational practice in dialogue with other teachers as 'the reflective dialogue'. The importance of this competence is reflected in the concerns of student teachers and beginning teachers with regard to their ability to evaluate their own professional development (Reeves & Kazelskis, 1985; Watzke, 2007). Meetings with parents form another major concern for beginning teachers (Veenman, 1984). This competence is measured with the scale 'Communication with parents'. This scale is related to the role of 'the teacher as partner of the parents/caretakers', which emphasises the importance of discretion in dealing with student information, providing advice and taking the social background of parents into account. The 'Awareness and responsibility' scale measures the extent to which beginning teachers develop a responsible educational style, while taking social issues and current events into account. This scale relates to the role of 'the teacher as member of the education community'. The 'Innovation' scale is strongly linked to the role of 'the teacher as innovator and researcher'. The final scale in the BeTeBaS questionnaire 'Member of the school team' is included in the role of 'the teacher as member of the school team'.

The division of the scales into the teaching and educational practice cluster and the interdisciplinary and reflective practice cluster is consistent with the findings of Huberman (1989, 1993). This author suggests that the first stage in a teacher's career is characterised by two dominant experiences: discovering and surviving. In addition to discovering the pleasure of teaching and finally being able to practice their occupation, teachers also have the feeling of surviving within the multiplicity and complexity of tasks and expectations related to the teaching profession. Beginning teachers face challenges in the classroom, and, as members of the school, they must learn to cooperate with colleagues, school management, administrators and parents. They must find their place within a culture that has its own traditions, customs, sensitivities, views and subgroups.

The validation of the BeTeBaS questionnaire (Dutch version) was limited to construct validation. Construct validation took place in two rounds, using data obtained with a survey of 451 (in September 2008) and 160 (in June 2009) beginning secondary teachers. We attribute the lower response rate in the second round to the timing of the survey. The considerable time and effort required to complete the extensive questionnaire (60 items, each of which had to be scored according to three different aspects) was compounded by the many tasks that are associated with the busy period at the end of the school year. In addition, the BeTeBaS questionnaire was used in a broader study investigating relationships between the attainment of basic skills

and the induction programme for beginning teachers. The second presentation of the questionnaire constituted the final measurement within this extensive research, in which drop-out was increased for each measurement.

The BeTeBaS questionnaire is a self-evaluation instrument with which beginning teachers assess their own basic skills. Self-evaluation fits within the current views on learning and teaching where the learner takes an active role in his learning process and self directed learning is stimulated (Segers, Dochy, & Cascallar, 2003). Research shows that respondents develop a greater responsibility towards their own learning when using self-evaluation instruments (Boud, 1995). However, it is conceivable that the results are affected by overestimation, underestimation or social desirability bias. We attempted to minimise social desirability bias by giving respondents the opportunity to assess three aspects of their competences: behaviour, capability and beliefs. Respondents were therefore invited to provide a balanced picture: whether they actually apply a given behaviour into practice, the extent to which they feel competent to do so and the extent to which they find it important. Measuring these three aspects in one questionnaire makes the instrument one of its kind. To our knowledge no instrument exists where these aspects are measured simultaneously for the same set of items.

The instrument can be used in several ways. It can initiate a reflection process in order to stimulate the beginning teacher's further professional development. Becoming an expert implies the progressive accumulation of a set of knowledge and skills that are developed through experience (Dall 'Alba & Sandberg, 2006). Schools can use the instrument to shape their induction programmes, adapting it to the needs of each beginning teacher. Also schools can use the instrument to develop the competencies of the entire teaching staff. The competence profile the instrument generates for each teacher can be used to identify specific teachers' competencies. These can in turn be embedded in professionalization activities. In an ongoing study Struyf, Adriaensens and Meynen explore the differences between male and female beginning teachers on the scale 'Reflection on teaching' and 'Reflection with others' and examine to what extend schools can stimulate this competence in the first year of their professional career. Teacher-training institutes can use the instrument to explore the evolution and attainment of basic skills by graduating students. Graduating students themselves can use the information in order to choose elective courses in their teacher programme. We advise users to supplement the results obtained with the BeTeBaS questionnaire with findings from observations in classrooms in order to compensate for the limitations of a self-evaluation instrument.

Because the instrument aims to provide a tool for initiating and supporting professional development and growth, we do not recommend its use as a tool for summary evaluation. Although the basic skills are applicable to all educational levels (e.g. primary and secondary) future research must be conducted to determine whether the instrument is also adequate for beginning primary teachers. Because we assume that novice and experienced teachers' competences differ based on the stage in their careers, research with the contrasting groups method (Newble, Hoare, & Baxter, 1982) can verify to what extent the BeTeBaS questionnaire features these differences in competences.

34 - Why Do Teachers Teach? A Phenomenological Insight Into Teachers' Philosophy

Khalil Gholami

Department of Education, University of Kurdistan, Iran
Khalilgholami2002@yahoo.com

Abstract: Using a phenomenological approach, this paper examines two Iranian teachers' conception of "whys" of teaching. In order to do so, the two teachers' personal beliefs of teaching were examined in the line with existing reflection on philosophy of teaching. In concert with Audi the data suggested that in the teachers' thinking there are two kinds of obligations running their teaching philosophy and thus their teaching activities: "*prima facie* obligations'" and "master obligations". In *prima facie* obligations "to each obligation (or duty), there corresponds a principle to the effect that we (morally) should fulfill it. The 'should', however, like 'duty' as Ross used it, does not designate the presence of a final, i.e., overriding, moral obligation. Master principles can support final moral obligation in a way no single *prima facie* can. On master principle theories, any *prima facie* principle owes its authority from the master principle.

Keywords: phronesis, teaching philosophy, neo-Aristotelian

INTRODUCTION

Peters (2009) distinguishes a "teaching philosophy" from a "philosophy of teaching arguing that:

> A 'teaching philosophy' is not a philosophy of teaching. It is a matter of personal belief, style and statement designed to encourage professional reflection without laying down universal principles or a substantive engagement with issues of teaching methodology…. Clearly, philosophy of teaching is a broader topic within philosophy of education whereas the personal statement wrongly referred as a 'teaching philosophy' is more to do with the demands that come from the university administration for improvements in the quality of university teaching. Where the former emanates from systematic reflection on the nature of teaching as a practice that has a long history the latter, it could be argued, springs from a business model of knowledge institutions based on the ideology of continuous improvement (p. 112).

In this way, a teacher's philosophy includes a teacher's personal conception of "Whats", "Hows", and particularly "Whys" of teaching activities. Stephen Brookfield (1990, as cited in Peters, 2009) suggested that a teaching philosophy is used personal and pedagogical purposes by which a teacher would have a clear vision of why she teaches and what effects she is going to have on students. A philosophy of teaching however deals with existing reflection on the moral and rational foundations of teaching from different perspectives. Based on this conceptual framework, this paper examines the following question: how do teachers' philosophies serve to contribute and develop the moral and rational foundations embedded in the philosophy of teaching? Drawing on empirical (Peters, 2009) data, this paper, thus, discusses the participating teachers' personal conceptions and reflections of teaching in relation to philosophical understanding embedded in neo-Aristotelian conception of practical reasoning.

TEACHING PHILOSOPHY FROM NEO-ARISTOTELIAN PERSPECTIVE

There is a critical question regarding to teaching: is teaching a "means" to bring about some isolated ends such as handing over specific subject matter, or it has, alongside conveying content, an "end" in itself? Reflection on this question can help us gain an insight into the philosophy of teaching. Alasdair McIntyre claims that:

> Teaching itself is not a practice, but a set of skills and habits put to the service of a variety of practices. The teacher should think of her or himself as a mathematician, a reader of poetry, an

historian or, whatever engaged, in communicating craft and knowledge to apprentices. It follows that you cannot train teachers well, until they have been educated into whatever discipline it is that they are to transmit….Teaching is never more that a means, that it has no point and purpose except for the point and purpose of the activities to which in introduces students. (McIntyre & Dunne, 2002, pp.6-9)

Josph Dunne, however, argues that "teaching *itself* is practice…since it [teaching] is an office that can define person's working life… and has its own specific goals realized in what you [McIntyre] have just called 'the development of its students power" (McIntyre & Dunne, 2002, p.7). Therefore, contrary to McIntyre, drawing from Aristotle, most neo-Aristotelian philosophers of education (e.g., Carr, 2004, 2005; Carr & Kemmis 1986; Dunne, 2003, 2005; Hamilton, 2005; Kemmis, 2005; Noddings, 2003; Schwandt, 2005) argue that teaching is a kind of practice closer in meaning to the Greek term *praxis* (i.e., it is practice that has internal good) and can be best understood within the conceptual framework of *phronesis* or practical reasoning. For Aristotle (1934), *phronesis* or prudence is concerned with human action or the matters of conduct. Thus, the rationality of *phronesis* in dealing with humans' conducts differs from scientific knowledge and technical skills. "It [phronesis] is not Science, because matters of conduct admit of variation; and not Art, because doing and making are generically different, since making aims at an end distinct from the act of making, whereas in doing the end cannot be other than the act itself: doing well is in itself the end…. It therefore follows that prudence [*phronesis*] is a truth attaining rational quality, concerned with action in relation to things that are good for human beings" (pp. 337-339).

From the same point of view some other educational researchers and philosophers of education (e.g., Hansen 2001; Richardson & Fenstermacher 2001; Fenstermacher 2001) believe that teaching is a moral and intellectual conduct, and thus teachers should have [good] "manner" to accomplish their educative purposes toward students. According to Hansen (2001), "teaching is not merely the enactment of a set of discrete skills or activities (or means) with an identity that exists apart from ends" (p.730). In this way all of teachers' activities should have an "end" in themselves. To conduct the teaching practice so and to be successful in cultivating the moral and intellectual properties of the students "the manner of the teacher is paramount…manner is defined as conduct expressive of dispositions or traits of character that fall into a category of moral goods Known as virtues" (Fenstermacher, 2001, p. 640). Such philosophical reflections on teaching from Aristotelian view, therefore, reject an instrumental or technical approach to teaching. However, the challenging question still is that how teachers themselves think about the nature of teaching as a moral or intellectual conduct. This paper, thus, is to gain an empirical insight into neo-Aristotelian philosophy of teaching by comparing with two teachers' teaching philosophy.

METHODS

Design and research strategy

The knowledge claim of this study (i.e., that teachers have their teaching philosophy was in accordance with assumptions embedded in "constructivist" paradigms and particularly social constructivism. According to this paradigm, individuals construct their knowledge within and in interaction with social contexts. They "seek understanding of the world in which they live and work; they develop subjective meanings of their experiences…these meanings are varied and multiple, leading the researcher to look for the complexity of views rather than narrowing meanings into a few categories or ideas; the goal of research, then, is to rely as much as possible on the participants' views of the situation being studied" (Creswell, 2003, p. 8). As discussed in introduction, a teacher philosophy refers to her personal beliefs on "whats", "Hows", and "Whys" of teaching activities that are supposed to develop throughout their experiential, social, and professional lives. Therefore, I espouse a qualitative approach with which to plumb the teachers' thinking and personal beliefs on the nature of teaching.

From different strategies of qualitative research approach, I mainly used the principles associated with methods (e.g., data collection technique, data analysis) and the assumptions (i.e., what kind of knowledge can be produced) corresponding to "phenomenography." Phenomenography is an empirical research tradition that addresses individuals' understanding, perceptions and conceptualizations of the world around them. "It is research which aims at description, analysis, and understanding of experiences; that is, research which is directed towards experiential description" (Marton, 1981, p. 180). In this type of research strategy, the research problem is studied from inside i.e., from the views of those who have experienced the problem. According to Marton (1981), in studying a research problem or phenomenon we may choose one of these two alternative perspectives:

In the first and by far the most commonly adopted perspective we orient ourselves towards the world and make statements about it. In the second perspective we orient ourselves towards people's ideas about the world (or their experience of it) and we make statements about people's ideas about the world (or about their experience of it). Let us call the former a first order and the latter a second-order perspective (p. 178).

Phenomenographic research, however, is more than simply reporting different people's conceptions and ideas about phenomena: it involves identifying the concepts and looking for their underlying meanings and the relationship between them. The ordered and related set of categories of description is called the "outcome space" of the concept being studied (Orgill, 2008).

Participants

Two Iranian middle school teachers (one male and one female) were main source of knowledge and data in this study. The male teacher (teacher 1) has 32 years and has been teaching science for 7-9 grade students for 8 years. The female teacher (teacher 2) is 38 years old and has been teaching literature for the same age-group of students for 12 years. The two teachers are acknowledged as "good' teachers among their students. I can say that the students extremely like the two teachers and everybody in the schools they teach wish to attend their classrooms. It can be said that they are good exemplars of "caring teachers".

Collecting tool

I used semi-structured interview to collect data. The main questions or themes of interview were identified based on my earlier experiences in research on teaching. These themes were related to the teacher's goal of teaching, relation between teacher and students, teaching strategies and approaches of teacher, concepts of good teacher and good student and discipline and order in classroom. In addition to these themes, there were a lot of probe questions while conducting interviews. The probe questions were considered as a chain of questions that aimed to gain more insight into teacher thinking and particularly to ask teachers show more evidence and reflection on their personal beliefs and philosophy. The following example shows the procedure of conducting interview:

> Q) What does it mean to be a good teacher?
> A) Well, a good teacher might have different properties, but I think a good teacher should have close relations with her students.
> Q) Could you let us know what do you mean by close relation?
> A) Ok, I mean you need to deal with students like a friend of them. You cannot be a good teacher and don't know what problems your students might have.
> Q) If your colleagues wanted to learn about this idea of close relationship, how do you convince them that having friendly relationship with students may work out?
> A) Well! It is quite clear, simply if your students would not trust you, you cannot teach them, help them, encourage them and thus they may not be able to learn effectively.

Each interview lasted about one hour and the interviews were audio-taped and transcribed verbatim.

Data analysis

The main goal of the data analysis was to understand the nature of teacher argument regarding different issues of teaching. Relying on Toulmin's (2003) model of argument an "abductive" procedure for categorizing data was designed to gain insight into the two teachers' personal teaching philosophy. Toulmin's model is a popular form of argument. This model is named after Stephen Toulmin, who in *The Uses of Argument* proposed that every good argument has six parts. The first three parts are essential to all arguments. These parts are claim, data, and warrant. Arguments may also contain one or more of three additional elements: backing, rebuttal, and qualifier (Toulmin, 2003).

A claim is the main point of the argument. A claim can be mapped up by asking, "What does one want to prove?" The response is the claim. The claim organizes the entire argument, and everything else in the argument is related to it. Data supply the evidence or other kinds of justification, such as reasoning and factual information about the claim, which makes it something others believe in it. Data can be identified by posing questions such as "What information does one need to convince his/her audience?" "Warrants are the

assumptions, general principles, the conventions of specific disciplines, widely held values, commonly accepted beliefs, and appeals to human motives that are an important part of any argument. Warrants originate with the arguer, but also exist in the minds of the audience. They can be shared by the arguer and the audience or they can be in conflict" (Wood, 2007, p. 1). The most important function of the warrant is to relate the data to the claim. Warrant can be interpreted by asking "Why does an arguer believe that his/her data are relevant for the claim?" Backing is more abstract evidence or additional information provided to "back up" a warrant whenever there is a strong possibility that your audience will reject it. A rebuttal establishes what is wrong, invalid, or unacceptable about an argument and may also present a counterargument (ibid., p. 2). A qualifier refers to the extent to which am argument is possible and indicates its strength. The figure 1illustrates the model of data analysis:

Quotation (an inclusive unit of argument)	Elements (single units) of argument and their relationship
A good teacher must be strict because if you give students too much freedom, they cannot work, and thus the learning tasks cannot be done very well. You know! In this class I am dealing with 25 young students with various backgrounds. But you should give them enough freedom so they can express their thinking and views on different issues in the classroom, but they still need your guidelines for how to work and act.	

Figure 1: The model of data analysis for teacher argument

Based on this model, I first wanted to determine to what degree the six parts of Toulmin's model could be identified in the teachers' arguments which in turn helped me understand the two teachers' personal teaching philosophy. I should also point out that elements claim, data, and warrant were the main source to understand the two teachers' teaching philosophy.

FINDINGS AND DISCUSSION

The main task of this study was to address the teachers' philosophy through examining their reasoning or what is called practical reasoning. The data suggested that the two teachers' teaching philosophy has two main dimensions: "moral reflection" and "pedagogic purposes".

Moral reflection
The two teachers' moral reflection was found to be related to their most fundamental values and personal beliefs regarding to human being in general and students in particular. The two teachers wanted to conduct their activities based on "moral care" toward students (Gholami, 2011). The teachers' moral reflection had three significant dimensions:
- Fairness
- Respectfulness
- Nurturing the character of students as human beings.
Fairness was connected to the teachers' beliefs by which they wanted to be "just and fair" in dealing with the students inside and outside of classroom. Teacher 1 stated that "when I teach in the classroom I try to have eye contact with all students because they understand and think how and to what extend I am unbiased from different aspects of my attention toward students".
In respectfulness the two teachers were concerned about the "collective status" of the students. The teachers believed that the students have formed a social status in the classroom and thus would have group sensitivity

in the classroom while dealing and interacting with their classmates and teachers. In order to not harm this feeling, teachers should be respectfully carful in their activities toward students in the front of classmates. Teacher 2 says "if one student misbehaves in the classroom, I will inform her that her deed was not good. Meanwhile I care about her respect and her feeling in the front of her classmate".

The third aspect of moral reflection was taking the "personal and social characters" of the students into account in the teachers' professional responsibilities. The two teachers argued that it is needed that teachers sometimes try to engage students in issues other than academic tasks. Teachers should put aside a particular time during their daily activities and talk about relevant issues of the students personal and social lives. Teacher 1 says "most often at the end of day we talk about important matters that the students are interested in; for example I ask students to go in the front of classroom and discuss important events in his life while the other classmates ask questions. This action help students learn from each other's personal experiences and thus nurture and develop their vision toward the word around them".

Moral reflection including its three dimensions is in accord with those moral theories by which human beings are considered as having intrinsic worth. In this sense, "it is not only students' rationality that must be respected; students need and want teachers to care for them as persons and to convey this care through listening and responding to their expression of concern. The teacher as a person is centrally important in teaching…the teacher sets an example with her whole self; her intellect, her responsiveness, her humor, her curiosity…her care" (Noddings, 2003, p. 244, see also Audi, 2006, pp. 139-140). Moral reflection was found to be based on "a one-sided feeling coming from teacher's side. [This feeling is] a teacher's pedagogical love (that) can be a foundation for *pedagogical friendship* which is reciprocal relationship between teacher and her pupils" (Kakkori & Huttunen, 2007, p. 27). The core value of moral care was the tenet by which teachers' pedagogical practice "should not harm students."

Pedagogic reflection

As Brookfield (1990) stated an important part of a teacher's teaching philosophy deals with pedagogical issues and is concerned with pedagogical purposes in order to bring about learning in students. According to Brookfield:

> Teaching is about making some kind of dent in the world so that the world is different than it was before you practiced your craft. Knowing clearly what kind of dent you want to make in the world means that you must continually ask yourself the most fundamental evaluative questions of all— What effect am I having on students and on their learning?

In the present study data suggested that core idea of the two teachers' pedagogic reflection was embedded in what I call "working action" which was presented in two distinct ways: "constructive working action" and "regulative working action". Constructive working activities were based on "caring pedagogy" (Gholami, 2011). The heart of such a notion was to bring about learning in the students' life by conducting careful or effective pedagogy. The two teachers tried to realize this professional obligation by means of two significant personal standards or principles: "pedagogical inclusion and accommodation". In other words, the teachers believed that an action is good provided it aims at, or has the epistemic condition of, engaging all students in the learning activities through accommodating their potential differences.

Teacher 1 stated one of his remarkable narratives in which his action was significantly constructive:

> Few years ago when I was teaching in high school there was a student in my physics class whom I found has serious problem in listening. His academic achievement was often disappointing and he used to fail in attaining good marks in many of the subjects he supposed to complete. When I found he has this problem, I tried to write down most of the learning tasks on whiteboard that I was orally explaining to other students-I was almost writing down whatever I presented in the classroom for other students. At the end of academic year, he succeeded to achieve highest grade in the class; something that was unbelievable for my colleagues.

This narrative shows how teachers' pedagogical flexibility in responsive to different background and properties of students was effective and thus worked in helping students enhance their learning capabilities. This notion of constructive working action is in accord with Oser, Dick, and Patry's (1992) perspective wherein effective teaching is seen as a morally responsible practice in which teachers' are responsible for developing intellectual and moral characteristics of their students.

The other dimension of the two teachers' pedagogic reflection was "regulating working action" where the teachers primarily wanted to implement an effective action to manage and regulate their teaching practice,

not to bring about learning for students, by espousing the principle "what works," with ignorance about what did not work. Teacher 1 argued that in some classes I had to establish strict rules and regulations. I sometimes had tough dealing with some students to teach the other classmates behave well and in according to rules because in those cases if I didn't act so the whole class would suffer from a big chaos during the whole academic year. In cases corresponding to this type of personal philosophy the teachers applied the kind of pedagogies in which the differences in the students' interests and capacities were ignored. Thus, teachers tried to assimilate most of the students' differences in their established pedagogical framework and rules. It seems that in such cases the nature of teacher reasoning was based on a "rationalization" process whereby teachers failed to understand and recognize the "salient" features of the case (Pendlebury, 1990).

Considering moral reflection and constructive working action, the teaching philosophy of the two teachers reflects the normative dimension of teaching whereby teachers believed that the existing teaching situation can be improved upon. Thus they had "moral care" and "caring pedagogy" (Gholami, 2011) at the core of their philosophy to improve the "intrinsic good" and the "intellectual qualities" of the students. Associated with the *phronesis-praxis* perspective, moral reflection and constructive working action indicate that the concept of "care" is placed at the core of teachers' philosophy. According to this perspective, teachers use what Pendlebury (1990) calls "constituent-to-ends" reasoning whereby the means and ends stand in reciprocal positions to each other – meaning that the "means" are not technically isolated from the "ends" (Gholami & Husu, 2010). Rather, the concept of care is embedded in both means and ends and places them in a mutual position so that the means constitute the ends. The findings, however, showed that not all of teachers' personal beliefs were in accord normative teaching. The notion of regulative working action suggested that the teachers sometimes failed to reflect on the ethical or moral dimensions of their practice.

Based on the findings and drawing from Audi (2006), I would like to argue that in the teachers' teaching philosophy there were two kinds of obligations running their teaching activities: "*prima facie* obligations" and "master obligations". In *prima facie* obligations "to each obligation (or duty), there corresponds a principle to the effect that we (morally) should fulfill it. The 'should', however, like 'duty' as Ross used it, does not designate the presence of a final, i.e., overriding, moral obligation, but rather that of a morally significant ground for action which will yield a final obligation if not outweighed by any other equally strong or stronger set of moral grounds" (p. 139). Master principles can support final moral obligation in a way no single *prima facie* can. On master principle theories, any *prima facie* principle owes its authority from the master principle. The findings suggested that there were two basic master obligations embedded in teachers' philosophy: "creating happiness" for the students, and "eliminating pain" (Gholami, 2011). In turn there were three associated *prima facie* obligations for fulfilling the master obligations: moral reflection, constructive working action, and regulative working action. In most cases, the *prima facie* obligations of teachers were found to be related to constructive working action (i.e., conducting pedagogical inclusion and accommodation to foster the learning capacity of students); however, constructive working actions were outweighed by activities associated with moral reflection and regulative working actions, depending on the different situations and contexts the teachers would face. In other words, in teaching practice, the main, basic, and most extensive *prima facie* obligation of teachers is to improve the intellectual properties of students, i.e., to bring about learning, which in turn meets the demands of teachers' master obligation, i.e., to provide happiness for students or remove pains. However, this main *prima facie* obligation is replaced by two other mentioned obligations namely moral reflection and regulative working actions. It means in the situations corresponding to moral reflection and regulative actions, to bring about learning is no longer the main point, i.e., *the prima facie* obligation, but the intentions associated with moral reflection and regulative actions become more important and thus become the new *prima facie* obligations for teachers. However, these two new obligations do not have the same epistemic value in fulfilling the demands of master obligations of teaching. While moral reflection, in addition to constructive working actions, is relevant for fulfilling the teachers' master obligations, the regulative working actions were mainly based on a rationalization process and thus may not be fully relevant for bringing about happiness for students and eliminating pain.

These findings show that the teachers' philosophy was in the line with philosophical understanding of teaching in the neo-Aristotelian perspective when they justified their teaching activities with values embedded in "moral reflection" and "constructive working actions". In both of these cases, teachers' activities should have had an "end" in themselves. However, the teachers' conception of teaching was not in accord with this philosophical view, when they justified their practices with "regulating pedagogy." In cases related to this pedagogy, teachers saw teaching as a "means" to bring about other "ends", which were not basically in the favor of students.

39 - Teacher Education and the Best-Loved Self

Cheryl J. Craig

Department of Curriculum and Instruction
University of Houston, USA
ccraig@uh.edu

Abstract: Four understandings arising from four different sources comprise the fodder of this paper. The first story fragment comes from the author's long-term research with Daryl Wilson, a middle school literacy teacher in Houston, Texas. The second story nugget comes from Miriam Ben-Peretz's research program in Israel, which she shared in China. As for the third story fragment, it arises from a small narrative shared by a doctoral student, Merieke Pillen from Eindhoven School of Education in The Netherlands at the International Study Association of Teachers and Teaching Conference held in Roveniemi, Finland. And the fourth has to do with the author's understanding of her role as an instructor of primarily doctoral students. As a Canadian living and working in the U.S., all four storied experiences revolve around a common theme—teachers' visions of self and others and how they desire to teach —in effect, "the best-loved self" and the contributions it makes to teacher education, the topic addressed in this paper.

The paper begins with the author's work with Daryl Wilson (_____, 2009). The work then flashes forward to a story excerpted from Miriam Ben-Peretz's (1995, pp. 76-77) research program. The research then moves on to Marieke Pillen's (2009) story from The Netherlands, which was part of a presentation at the ISATT Conference in Finland. The fourth scenario concerns the author and the course appraisals at her institution.

When these four vignettes from different continents were analyzed, a narrative resonance (Conle, 1996) emerged from them which provided palpable evidence that teachers naturally gravitate toward teaching what Schwab called "their best-loved selves." The work then unpacks what Schwab specfically had to say about "best loved selves," i.e.

> [The Teacher] wants something more for his students than the capacity to give back to him a report of what he himself has said. [The Teacher] wants them to possess a knowledge or a skill in the same way that he possesses it, as a part of his best-loved self…He (sic) wants to communicate some of the fire he feels, some of the Eros he possesses, for a valued object. His (sic) controlled and conscious purpose is to liberate, not captivate the student (Schwab, 1954/1978, p. 124-125).

The work then provides strong justification for probing the best-loved self and consciously addressing what the concept offers teacher education. The U.S.'s Marilyn Cochran-Smith and Ken Zeichner (2005) and Marilyn Cochran-Smith and Susan Lytle (2009) and Israel's Miriam Ben-Peretz (2009) have underscored the fact that concrete examples of how to prepare preservice teachers as curriculum-makers are urgently needed in the field of education. As this paper argues, the best-loved self is foundational to understanding the image of teacher as curriculum-maker (Clandinin & Connelly, 1992).

The research then revisits the four vignettes, keeping the following inquiry questions in mind: (1) If the best-loved self is integral to the teacher-as-curriculum-maker image, what practices might we engage in in teacher education to foster the best-loved self? And (2) How does change happen in preservice teachers' pedagogical practices and repertoires, given the potential significance of the teacher's best-loved self image?

The paper then carefully sifts through the revelations apparent in each of the four narratives of experience. It concludes with critically important ideas that international research conducted about teachers teaching their "best-loved selves" has to contribute to teacher education as lived in Colleges of Education dotted around the globe.

Keywords: teacher education, teacher mentoring, teacher development, teacher identity, teacher reification

NARRATIVE BEGINNINGS

Four understandings arising from four different sources intersect to form the topic of this paper. The first story fragment comes from my long-term research with Daryl Wilson, a middle school literacy teacher in Houston, Texas (Craig, 2009a, 2009b). The second story nugget comes from Miriam Ben-Peretz's research program in Israel, which she shared in Beijing, China in the summer of 2009 (Ben-Peretz, 2009). As for the third story fragment, it arises from a small narrative shared by doctoral student, Merike Pillen from

Eindhoven School of Education in The Netherlands, at the International Study Association of Teachers and Teaching Conference held in Roveniemi, Finland, also in 2009 (Pillen, Beijaard, & Den Brok, 2009). And the fourth has to do with my understanding of my role as an instructor of primarily doctoral students studying teaching and teacher education. To me, a Canadian living and working in the U.S., all four storied experiences revolve around a common theme—teachers' visions of self and how they desire to teach—in effect, the topic I address in this paper.

PRELIMINARY ANALYSIS

I begin with my own work with Daryl Wilson (Craig, 2009a, 2009b). I will say a bit more about it and my personal story than the middle two examples because I understandably know more about those situations and contexts. When Daryl's campus became involved with a readers' and writers' workshop approach to literacy instruction, he grieved the fact that he no long would be able to teach the Holocaust unit of study he had developed over a period of years, alongside his personal travels to Israel and the Jewish Concentration Camps in Europe. With his school's hiring of a readers' and writers' literacy expert, new units of study were collaboratively developed and all of the teachers' previous curriculum development—one might say, their scholarship—was purged. Daryl, as Department Chair, mourned this loss—and the associated loss to his students who, to his way of thinking, were not connecting to the new foci of study with the same enthusiasm and intellectual engagement as previous students had related to his Holocaust unit. In my research with Daryl, I saw his self-directed agency as a teacher who viewed teaching through the teacher-as-curriculum-maker lens being suppressed as the view of teacher-as-curriculum-implementer—doing what he was told to do—took precedence in his school context, especially administratively where teaching tended to be seen as something to be determined, regulated, and monitored by others. Also, other teacher participants in the same study lamented Daryl's loss—laying it alongside their corresponding regrets—and discussing what had happened to the literacy department at Yaeger—and Yaeger's students—often. One female colleague of Daryl's, for example, said the approach made her feel captive like a "butterfly under a pin" (Craig, in press). Another mentioned that what had happened had metaphorically "pulled [teachers] through knotholes" in trees, presumably reshaping their practices in ways acceptable to those in charge—that is, consultants, administrators, school district/state agency personnel and policy makers, but at the expense of the personal practical knowledge (Clandinin, 1986; Clandinin & Connelly, 1985) of the teachers enacting them.

I am now going to flash forward to a story I am excerpting from Miriam Ben-Peretz's (1995) research program. Miriam tells the story of a teacher with seven years of experience who taught a 5th grade math lesson in a manner that another expert teacher who was a textbook author advised. The teachers' teaching was appraised by the same superintendent who had previously observed the teacher teaching Bible and language arts classes. However, upon observing the lesson that was satisfactorily taught and subsequently passed inspection, the superintendent remarked that the teacher should not feel compelled to teach in ways that did not resonate with her. He specifically advised: "Don't use a teaching method that doesn't suit your personality. Be yourself". His insightful comment reminded the teacher that the lesson was, in her words, "not me". His noting of the mismatch reminded the teacher of the vital connections between the personal and the professional and how educators should not have to compromise one for the other. Also, the fact that the teacher related the story fragment to Miriam Ben-Peretz in a research interview eight years after the teacher retired from a 35-year career of teaching and that Ben-Peretz chose to include the telling comment from her 1995 book in a 2009 keynote address in Beijing, China (Ben-Peretz, 2009) underscores the importance of the teacher's recollection and the significance both the teacher and the researcher afforded it.

I now move on to Marieke Pillen's narrative from The Netherlands, which was part of a presentation on professional identity dilemmas (Pillen, Beijaard, & Den Brok, 2009) at the International Study Association of Teachers and Teaching (ISATT) Conference in Finland. While conceptualizing personal, professional, and contextual elements of teacher identity, a small passage in which a teacher candidate reflected on his expert mentor's advice was offered as an example: "He tells me how to teach, but that is not how I want to teach: It does not suit me." Once again, we see the expert—this time, a mentor enacting a particular image of mentorship/teaching (i.e., mentor/teacher-as-implementer)—proclaiming what constitutes best practice—and the preservice teacher's knowing and sensibilities being diminished—but not without the beginning teacher expressing his knowing of what was going on and his sense of regret.

My fourth scenario concerns me. On the course appraisals at my institution and on our annual Curriculum Vitas for salary purposes is a relatively new section having to with faculty members' use of technology. While I use technology in the gathering, coding, and storing of research data, frequently deliver multi-image PowerPoint presentations and have helped to create digital stories as representations of narrative inquiry (probably the first to spearhead a narrative inquiry team experimenting with the latter), I am quite reluctant

to use digital approaches to teaching advanced research methods classes. In my personally held view of teaching and learning, more is learned through showing than telling. I reason that my students want to personally interact with me concerning how I conduct my research rather than viewing jazzed up presentations depicting the fruits of my labors. So, while I am comfortable with technology communicating understandings in one-shot presentations, I am not okay with it replacing my face-to-face instruction—and my developing relationships with my students and what they subsequently come to know about teaching and curriculum.

When I combined these four scenarios that I encountered and mused over on a number of different occasions—indeed on different continents, the following revelations bubbled to the surface:

(1) Daryl Wilson tells story of loss to me; he says teacher colleagues and parents also recognize loss;
(2) Israeli teacher tells Miriam Ben-Peretz the story of what her superintendent told her;
(3) Dutch preservice teacher tells Merike Pillen his response to what his mentor told him;
(4) I share my story of technology requirements imposed on me for accountability purposes.

When I meshed these four diverse experiences together, engaging in what Schwab (1983) called "serial interpretation," I found what Conle (1996) termed "narrative resonance" between and among:

1) Two narratives (Israel and Dutch exemplars) that had to do with stories being given back by researchers, and, in turn, used in a layered research way by me;
2) Two narratives (Daryl Wilson's and my own) corroborated by others (in Daryl's case, his colleagues—in my case, my students) and, in turn, used in a layered research way by me.

The narrative resonance arising from these stories provided me with palpable evidence—derived internationally, nonetheless—that teachers naturally gravitate toward teaching what Schwab called "their best-loved selves". It seems Daryl Wilson and his colleagues understood this; the teacher and superintendent quoted in Ben-Peretz's Israeli study understood this; the teacher candidate discussed in Marieke Pillen's Dutch inquiry understood this—and I certainly understand this because I have listened hard to the stories students give back to me about my teaching throughout the course of my career. My students tell me that when I am "on my game"—which I take to mean, enacting and exuding my "best-loved self," they are more apt to learn about curriculum, teaching and research.

What I will do now is examine further what Schwab might have meant by the expression, teachers' best-loved selves, through traversing the breadth of his scholarship and connecting it with some more recent research on his line of inquiry. That will set the backdrop for specifically thinking about best-loved selves and the idea's relevance to, and application in, teacher education.

Probing the Idea of Best-Loved Self

In Schwab's early writing, he outlined the distinctive properties of human nature. The "human person," he observed, is a "self-moving living thing" that is able to "produce itself," to "develop itself," and to create a "personal history" that is non-replicable (Schwab, 1964, p. 8). Furthermore, when Schwab (1969, 1971, 1973, 1983) developed 'the practical,' he underlined the utter necessity of diverse groups of people engaging in curriculum deliberations. These individuals would represent different commonplaces of curriculum of equal importance (Student, Teacher, Subject Matter, Milieu). Perhaps just as importantly, they would articulate "differing selves" (Schwab, 1983). Also, in a curriculum handbook chapter (Craig & Ross, 2008), Vicki Ross and I examined metaphors of teacher learning by exploring the differences that Schwab forged between stable and fluid forms of inquiry. Schwab favored education through the growth metaphor as Dewey (1938) before him did. He boldly declared that people are not only products of their education, but products of the choices their selves make (Schwab, 1960/1978, p. 218). Schwab (1971) furthermore added that flexible inquirers such as teachers—that is, those interacting in complex milieus—are the result of "intelligent rebellion and self-education after [they] are trained…" (Schwab, 1971, p. 23). Here, we see how the self figured large in Schwab's understandings of how education happens. Even amid prescription and shared practices and procedures, Schwab found important spaces where the self makes choices.

Schwab also stalwartly supported teachers and gave unwavering support to their "…looking at their own practices and the consequences of them…" (Schwab, 1959/1978, p. 168). He additionally emphasized that teachers have "different bents" (Schwab, 1983, p. 241) and, hence, their strengths and reflections on practice will necessarily differ. In all cases, from matters of curriculum to testing to educational policy, Schwab left discretionary powers with the individual teacher because he understood that no enactment of curriculum would be complete without his/her active engagement. For him, the teacher was the "fountainhead of the

curricular decision" (Schwab, 1983). Students "are better known by no one [else] but the teacher," Schwab said, because the teacher is the only one who actively "tries to teach them"; he/she is the only one "who lives with them for the better part of the day and the better part of the year" (Schwab, 1983, p. 245). In fact, on one occasion in 1950, Schwab entered into a heated debate with an unnamed professor at an Educational Testing Services Meeting. The unnamed professor maintained that teachers meeting together in groups represented "a pooling of ignorance" (Westbury & Wilkof, 1978, p. 31). In stark contrast, Schwab vigorously defended the idea of teachers' learning together. For him, teacher deliberations result in "a pooling of diversities of experience and insight" (Schwab, 1969, p. 30).

To Schwab's way of thinking, recognizing that teachers are "agent[s] of education, not of its subject matter" (Schwab, 1954/1978, p. 128) is the only conceivable road to sustained improvement of practice because:

> …only as the teacher uses the classroom as the occasion and the means to reflect upon education as a whole (ends as well as means), as the laboratory in which to translate reflections into actions and thus to test reflections, actions, and outcomes, against many criteria is he [sic] a good … teacher" (Schwab, 1959/1978, pp. 182-183).

Not surprisingly, Schwab articulated an expansive vision for the role of university faculty as well. There, too, he loosened the subject matter straitjacket, favoring a more organic, interactive role for professors. In his carefully selected words, the faculty member

> …is a possessor and imparter of disciplines in quite another sense: mentor, guide, and model; ally of the student against ignorance, participant with the student in high adventures into the worlds of intellect and sensibility (Schwab, 1969, p. 20).

These passages excerpted from Schwab's scholarship over the continuum of his career provide critical background that promotes the understanding of what Schwab meant by teachers teaching their "best-loved selves"—without their selves being the curriculum. In his work, it is clear that all people cultivate themselves through a myriad of near imperceptible decisions they make—and that through this ongoing sense-making of experience in context and over time, individual persons become "differing selves" who have the capacity to actively contribute to and shape curricular situations.

In a like manner, Schwab envisioned the individual teacher producing him/herself in non-replicable ways. This, too, occurred through self-education and dialectic reflection on means and ends, and also through rebellion of training because training, in his view, threatens the agency, autonomy, and identity of selves through making impositions on the self in the midst of its making. Also, because all human beings have choices to make with respect to how they act as independent agents, so, too, do teachers.

As mentioned, teachers have discretionary power. They encounter constant "moments of choice" (Schwab, 1983) in their face-to-face work with children throughout the school day. Such choices range from how they present subject matter to the virtues they stress in the classroom. They also have to do with which students are praised or punished and with how the teacher generally presents him/herself in class, even without uttering a word.

Schwab's early work on the commonplaces in curriculum making acknowledges the essential role of the teacher and sets the stage for the teacher serving not as a conduit of the state—that is, teacher-as-curriculum-implementer, but as teacher-as-curriculum-maker (Connelly & Clandinin, 1988; Clandinin & Connelly, 1992)—that is, taking up his/her rightful place as a "fountainhead of the curricular decision" because as Schwab earlier maintained, he/she is the only one who dwells with, and labors alongside, students for several hours a day.

A student of Joseph Schwab, Michael Connelly, along with his student, Jean Clandinin, picked up on these threads of Schwab's scholarship, conceptualizing the two aforementioned phenomena as images of teaching (Clandinin & Connelly, 1985)—that is, the image of teacher-as-curriculum-implementer and the image of teacher-as-curriculum-maker.

These images, of course, hunker back to Schwab's commonplaces of curriculum that I earlier presented. Clandinin and Connelly's idea of teacher images—derived from their close research with classroom teachers in Canada—takes into account the shaping effects of teachers' personal practical knowledge rather than letting others' prescriptions and moral admonitions for teachers—expressed in formal knowledge statements—pave the way. In the scenario they paint, the cart does not lead the horse as Clandinin and Connelly (1992) metaphorically put it. For them,

The most important aspects of teacher education are often ephemeral, passionate, shadowy and significant. For the most part, [they]…reflect teachers' lives… (Connelly & Clandinin, 2004, p. 42).

This explains why we have to be modest in our expectations of what can be singularly achieved through formal teacher education programs.

Combining what Schwab had to say about the self in the course of his career with what Clandinin and Connelly conceptualized as teacher images—teachers' personal practice knowledge in action—it appears that Schwab's notion about teachers' best-loved selves was an image emanating from his teaching practice. In fact, these are the words he chose to describe it in his *Eros and education* paper:

> He (Joseph Schwab) wants something more for his students than the capacity to give back to him a report of what he himself has said. He (Joseph Schwab) wants them to possess a knowledge or a skill in the same way that he possesses it, as a part of his best-loved self…He (Joseph Schwab) wants to communicate some of the fire he feels, some of the Eros he possesses, for a valued object. His controlled and conscious purpose is to liberate, not captivate the student (Schwab, 1954/1978, p. 124-125).

Two pieces of concrete evidence support this interpretation. The first is that Schwab broke ground by making his personal teaching practice "a proper object of study," which is how Lee Shulman, another of Schwab's students, referred to Schwab's contribution (Shulman in Brandt, 1992; Lee Shulman, Personal Communication, 2006). The second is that Joseph Schwab, like Philip Jackson, drew on "[his] ideas about teaching" rather than "images of research as others were doing," according to Clandinin and Connelly (1992, p. 380). Through this approach, Schwab avoided a major obstacle—"the vice of abstraction" —about which he so cogently wrote—which is a worldview that produces "flights from the field" (Schwab, 1969). Also, there is an associated factor in this mix, a point that few in the present generation of scholars know. Not only was Schwab arguably the most recognized researcher in the field of curriculum during his era, he also was honored as an excellent instructor, having been awarded the University of Chicago's teaching excellence award on two occasions (1938, 1965). This especially makes thinking about Schwab's notion of teachers teaching their best-loved selves in the same vein as the image of teacher-as-curriculum-maker a profitable thought enterprise. Presumably, Schwab's personal 'excellence in teaching' was fueled by his 'best-loved self,' about which he must have been reflecting because he was certainly publicly writing about it.

Cultivating the Image of the Best-Loved Self

With all of these building blocks in place, we are now in a position to consider teacher education and how prospective teachers' best-loved selves could be cultivated. Before begin this portion of the inquiry, it is important to assert that strong justification for our engaging in this conversation can be found in the research of the U.S.'s Marilyn Cochran-Smith and Ken Zeichner (2005) and Marilyn Cochran-Smith and Susan Lytle (2009) and Israel's Miriam Ben-Peretz (2009b), all of whom have underscored the fact that concrete examples of how to prepare preservice teachers as curriculum-makers are urgently needed in the field of education. So, (1) if the best-loved self is integral to the teacher-as-curriculum-maker image, what practices might we engage in in teacher education to foster the best-loved self? And (2) How does change happen in preservice teachers' pedagogical practices and repertoires, given the potential significance of the teacher's best-loved self image? I will begin by working with the first query and drawing on the narrative fragments I used to open this paper as well on the literature and my own experiences and sensibilities as a student, teacher, and researcher. All the while, of course, we will keep in mind Schwab's assertion that prospective and practicing teachers "*must* be involved in debate, deliberation, and decision about what and how to teach" (Schwab, 1983, p. 245, italics in original).

Let us begin with the small story I shared about Daryl Wilson and discuss what it offers in terms of teacher-as-curriculum-maker advice. In that narrative, Daryl spoke of a unit of study that he personally developed around a historical issue—in his case, the Holocaust—and how that unit of study resonated more with his students/himself than the readers' and writers' workshop activities he and his colleagues had more recently planned under the direction of a consultant. Daryl's story presents us with at least three curriculum making considerations: (1) he, as an individual teacher, wants choice where the content of the exemplar (in his case, social issue) around which his students will write is concerned; (2) he, as an individual teacher, wants choice in his teaching method (he did not appreciate being forced into using the workshop approach); and (3) he, as an individual teacher, wants his knowledge to be considered significant and relevant, not rendered insignificant and irrelevant in the face of the consultant's expert knowledge.

Moving on to the teacher in Miriam Ben-Peretz's story, that individual showed how she, like Daryl, could teach successfully using an approach that differed from her own style. However, the feedback she received—this time from a superintendent, not students as was the case with Daryl—was that the new approach did not fit her personality. In this vignette, the superintendent provides the teacher-as-curriculum maker advice: (1) teach from strength—from natural sources within one's personality as opposed to parroting teaching as described in manuals and copycatting others' expert teaching strategies.

As for Merike Pillen's Dutch study on beginning teacher identity dilemmas, we also learn two things about curriculum making—this time from a student teacher. Once again, (1) a teacher's personal sense of self is wrapped up in his/her public display of the teaching act and (2) preservice teachers' curriculum-making is productive when their preliminary knowledge of their personal selves is supported not diminished by more interventionist approaches to mentoring.

The fourth story I shared had to do with technology and me. From it, we learn the following about curriculum-making. Edicts from above may (1) interfere with personal learning, (2) be less-than-appropriate when general understandings are applied to the individual case, and (3) add to the rejection of practices that initially held the possibility of becoming part of teachers' best-loved selves.

Taken together, all four narratives display rebellion and efforts to self educate in the midst—or in the aftermath—of training. The lesson that these stories from the field teach is that rebellion, appropriately expressed, may be an important sign of growth in the development of strong, independent teachers and their identities, an idea that is consonant with what Schwab had to say about best-loved selves.

However, in the narratives, we also see others contributing to the teacher education experience: (1) an educational consultant; (2) a superintendent; (3) an assigned mentor; and (4) administrators in the background making generic decisions in the general educational milieu. Surprisingly, only the superintendent urged the teacher to free herself of the training mindset and encouraged her to make curriculum in a way that resonates with her best-loved self. In the other three instances, the expectations of one who is trained/prepared in a particular way continued to be imposed on the individuals. More than that, the expectations were actively enforced through observation and evaluation. This left the teachers in all aspects of the field of education personally navigating ways to free themselves to become their personal versions of better teachers—ironically at considerable professional risk. Unfortunately, the prevalent teacher-as-curriculum-implementer image, which undoubtedly works over the short haul, inevitably stunts educators' growth. It is just a matter of time as to when that happens. In sharp contrast stands the teacher-as-curriculum-maker image, particularly the best-loved self part of it, which advances teachers' sense of knowing on the learning continuum and propels them to continue to improve in an effort to become the teachers they could be.

If this comes across as a paradox—and it is, there is an even greater paradox at work where teacher education is concerned. Not only do government policies demand the preparation of teachers-as-curriculum-implementers, prospective teachers, if left to their own devices, would choose that image for themselves when they begin their teacher education programs. "Tell us what to do" is their most fervent plea. After all, as Schwab informed us, they need to be in the throes or aftermath of training or actively involved in self-education in order to encounter the image's limitations on their sense of selves as teachers.

Furthermore, we as teacher educators also would like to a have a definitive answer to address our students' "tell us what to do" demands. But, when we are brutally honest with ourselves and with them, we do not know exactly how things will unfurl until the teacher-student-subject matter-milieu dynamic plays out. We are like Schwab himself who once told the following to a group of students assembled in a Michigan State University class:

> I'd like to tell you exactly where we are going, and what steps and at what rate, and I can't at all; because if [this class] is properly planned, where we are going is somewhere you have not been and the words which would describe it would make no more sense than to talk about dogs to somebody who has never seen an animal. (p. 3)

What we hear in Schwab's rather humorous analogy is an idea that parallels something that Donald Schön (1983), another Deweyan scholar, had to say: "People cannot be taught [in direct input-output ways]; they can only be coached." This, of course, brings us full circle to the other people in the stories I featured—the educational consultant, the superintendent, the mentor, and other administrators in the general educational milieu—all of whom are living and advocating certain images of teaching, like the teacher educator, and presenting those images as possible 'stories to live by' to impressionable, neophyte teachers.

Changing the Image of the Best-Loved Self

This brings us to the second question raised: How does change happen in preservice teachers' pedagogical practices and repertoires, given the potential significance of the teacher's best-loved self image? Once again, I think answers are present in the story nuggets I shared. In Daryl Wilson's case, the answer resided with the next educational consultant with whom he worked and the different plotlines apparent in the consulting story she was living. She made a case for a particular writing strategy and set up the conditions for Daryl to experiment with it. But she did not impose her expertise on Daryl or seek to narrow his teaching choices. Rather, she walked alongside him in the learning process. And surprise, surprise—Daryl Wilson made the strategy he learned through example part of his teaching repertoire and even used his own experimental writing as a way to fuel his students' learning and his fellow literacy teachers' learning about writers' workshop. In the Israeli teacher's story, change initially came through the teacher conforming to mandates and following the modeling of another teacher's lesson, but then paradigmatic change happened through listening to the feedback an authority figure gave back to her. How refreshing it was to see a superintendent using his narrative authority (Olson, 1995)—coupled with his authority of position—to support the teachers' best-loved self (and perhaps in doing so the superintendent enacted his best-loved self?). We also see the researcher, Miriam Ben-Peretz, championing the teachers' best loved self—and perhaps, in turn, Ben-Peretz's own best-loved self. With the Dutch preservice teacher, there is no immediate evidence of change in practice in the vignette. However, the preservice teacher is highly reflective, is willing to express his narrative authority and is doing so in the audience of researcher, Merike Pillen, who may be able to assist him by walking alongside him in a teacher/researcher relationship. Clearly, the preservice teacher points to the need for change—and clearly whatever change happens will be more aligned with the preservice teacher's vision of his best-loved self (even if it sadly entails his leaving the profession). Finally, there was my personal example. In it, I spoke of media requirements being added without consultation to our evaluations in order to promote greater use of technology. Like Daryl Wilson and the Dutch preservice teacher, the mandate ran against the grain of how I perceive myself as teaching best. At the same time, I was able to supply examples of how I teach and conduct research using advanced technology. In my story like that of Daryl Wilson, I relied heavily on students' responses to my teaching. In both of our cases, it appears that Daryl Wilson and I would have been willing to change our practices if we felt the need arising in the stories of our teaching we were receiving from our students. In fact, as an aside, I want to add that I had several advanced technology students in my class a year ago and they wanted to experiment with digital stories as technological containers for research and teaching findings. I thoroughly welcomed the opportunity to work with them and, as a result, now use digital stories in my teaching practice and in my research program. In fact, I have even been awarded a grant to accomplish what I have described. The upshot here is that my students provided me with a pathway through which the new approach could become an integral part of my research and teaching repertoires and my best-loved self. Ironically, this change was fueled by my desire to assist them in moving closer to their best-loved selves. In fact, I think that in all of the narrative exemplars (Lyons & LaBoskey, 2002) shared, we can see a circle of educators seeking, to varying degrees, their best-loved selves—but some, at times, at the expense of others.

CLOSING COMMENTS

For the past four years, I have been fascinated by Schwab's idea of the teachers' best-loved selves and how vitally important the idea is to understanding curriculum and teaching situations, particularly the teacher commonplace and the teacher-as-curriculum-maker image and how absolutely foundational the notion is to high quality teacher education. In fact, my interest led me to visit the Schwab Archive at the University of Chicago this past winter. Amid the countless folders of material I browsed, I found the manuscript of Schwab's unpublished book, *Community: A Mission for the Schools*. Its preface was addressed to teachers and expressed "the need to worry a little about who teaches what to whom in…schools." It also emphasized the importance of having "more satisfying lives" (p. i). When I read that Preface, I could not help but think that best-loved selves figured largely in Schwab's vision of more satisfying lives. But it also caused me to think that our single-minded focus on the image of the teacher-as-curriculum-implementer has seriously stunted preservice teachers' growth and bounded who they are rather than cultivating them into who they could be as mentors, guides, models, allies—to borrow Schwab's words—of the students they will teach. Serendipitously, the book, *Teachers as Learners: Critical discourse on challenges and opportunities*, edited by Hong Kong's Ora Kwo, a book that I reviewed for *Teaching and Teacher Education*, crossed my desk at about the same time. In that book, Kwo referenced the Delors Report (1996) commissioned by UNESCO. In that report, four pillars of education were internationally agreed upon: learning to know, learning to do, learning to live together, and learning to be (Delors Report, 1996). Sadly, a great deal of attention has been

placed on 1) knowing and 2) doing in formal teacher education and precious little attention has been given 3) living together and 4) being. I think Joseph Schwab's notion of the best-loved self attended in a very large way to being and living together and was a ground-breaking idea ahead of its time. Finally, I thank my fellow ISATT panel members for the opportunity to discuss the idea of the best-loved self with a shared international commitment to high quality teacher education held firmly in mind.

53 - Literacy teachers' didactic choices

Simone Garbi Santana Molinari

Pontifical Catholic University of São Paulo/ PUC-SP.
simonemolinari@uol.com.br

Abstract: This article is about the didactic choices made by literacy teachers from state schools, in São Paulo. The aiming is to understand the teaching work of this group, through the verification and analysis of those teachers' pedagogic practices in their daily school routine. With observations from the classroom, from the teachers' meeting room, and the answers from questionnaires and interviews, it was possible to conclude that the manuals of didactic instruction which were offered to the teachers and their pedagogic training are not enough to guarantee, in their actions, the appropriation of the proposed knowledge.

It is necessary to consider this professional's life trajectory, not only at the teaching work, in order to understand the reasons, though unconscious from the common sense, that motivate them to make their didactic choices in the classroom.

Keywords: Literacy. Teaching work. Didactic choices.

INTRODUCTION

This work is about the literacy teacher's work, which has two elements to be discussed:

1. The changes that occurred in the literacy area, from the 1980s, influenced the literacy teacher's practice.

2. The didactic choices made by those teachers characterize the confusion provoked by those chances.

It is my intention to explicit and discuss the research results from 2008 to 2010, in order to achieve the Master's degree, in the program of Graduate Studies in Education: History, Politics, Society, of the Pontifical Catholic University of São Paulo. The research was accomplished in a state public school in São Paulo, aiming to verify and understand the choices a teacher, who works with children in literacy process, makes in his/her daily school routine.

These choices, that characterize the teaching work, are also linked to factors such as social origin, instructional and family formation and are, sometimes, imperceptible, unintentional, to the ones who make them. However, the school teaching is marked by intentional characteristics (Marin, 2005) and the teacher is responsible for elaborating the activities, observing the students, and evaluating them. This school dynamics, that involves the teaching work, especially the one that is related to children in the literacy process, is not alone, even though it seems to be. The way the school organizes itself directly interferes in the teacher's work.

Changes in the literacy program since 1980

There are many research studies that aimed to analyze the literacy theme. Those which investigate the teachers' concepts in the classroom are, sometimes, the ones that better justify the teaching work.

Vieira's studies (2007) point that, from the 1980s, the teaching practice in the literacy process has suffered some changes, such as: the use of new technologies, Emilia Ferreiro's and Ana Teberosky's research (1985) about the written language acquisition, the implementation of politics to organize the school's space and time, based in the constructivist approach, the creation of the Literacy Cycle in public schools and the increase of this Cycle to the 3rd and 4th grades of Primary School.

Before the 1980s, we verify that the teaching practices in the literacy process are characterized by the adoption of a synthetic or analytical method. Such methods were worked in the textbooks, which were considered genuine manuals, once they organized, selected and conducted the teacher's work. According to the constructivist proposal, the textbooks did not provide the social function of the written language to the student, because they did not bring authentic texts, that is, texts within a range of genres that are part of the society. According to Vieira (2007), when working with different kinds of texts, the teacher needs different teaching procedures, which are based upon the observation and the interpretation of the students' cognitive processes to the acquisition of the written language.

Although the textbooks have been edited so far, new literacy books have been elaborated and started to demand from the literacy teacher new abilities and competences to teach how to read and write, but this new scenery has not necessarily confirmed the renovation of the teaching practice, since the concerns about the theme have not ended yet.

Not only Ferreiro's and Teberosky's studies have contributed to the changes in the literacy area. At the same time, in the middle of the 1980s, the country was passing by a political transition, "characterized by the change from a dictatorial government to the construction of a democratic society" (Mamede, 2000, p. 1). This context, according the author, must be remembered, because the "education is strongly linked to social, political and economical issues" (p.15).

In 1984, the Basic Cycle started to operate in the state public schools, being implemented just in the 1st grade of Primary School. The year after that, in 1985, the implementation was extended to the 2nd grade of Primary School. One of the challenges faced by the teachers in the 1980s was the re-elaboration of the concepts that had been learned so far, since it was the beginning of the cycle implementation all over the public schools and also the implementation of the constructivist perspective. However, Mamede (2000) points out that, in such a big country as Brazil, where the social differences are unbearable, several teachers did not have (and have still not had) the minimum conditions to understand this new paradigm. According to her, in the cities she visited during her research data collection, she verified that several teachers used to work in places which are "forgotten" by the State, living collectively in a profound isolation. So, succeeding to survive in the given conditions was already an innovative action.

The expression "innovative action" has several interpretations, according to different studies. To Zunino (2003), the teachers want to teach their students read and write and search for different ways of doing it. However, many of them feel they are alone, as islands. They miss collective thought and action, which are not provided by the school organization. The practices that are considered innovative are isolated and the course of work is "very little reflexive and shared" (p. 124). In this way, the author observed the dissonance between the discourse (based mostly in a constructivist perspective of teaching and learning) and the action (reinforced by models of exercises and evaluation criteria based in the traditional pedagogy).

With the same concern, Silveira (2004) demonstrates that the knowledge teachers have about the acquisition of the written language could be verified in three aspects of their action in the classroom: the mediation, the interaction and the constructive mistake. According to the author, there is an oscillation between those attitudes, which sometimes are influenced by the associationist presuppositions, making the teachers sometimes oscillate between the traditional method and the constructivist proposal.

These positions are directly reflected in the practice and the work organization. This organization is characterized by Oliveira (2008) as a consequence of a history of the literacy process marked by manuals and textbooks built out of the school context. Because of those manuals, the teachers started to be considered mere executors and task performers. To the author, such fact may have influenced the teachers to face the challenges, from the point of view of the reflection upon the given conditions, as well as the reflections upon the students' learning.

Oliveira (2008) points out the public politics and not only the academic environment, from where the teachers got in touch with the constructivism, as responsible for the imposition of the so called "savior" practices.

Taking in consideration that the knowledge is constituted through the teacher's trajectory and the conceptions are related to the idea about something, it is possible to assume that there is also the possibility of judgment in the presence of the teachers' positions, that is, they could be considered more or less efficient because of their conceptions.

For the last twenty-five years, the concept of literacy has achieved different meanings. Firstly, as mentioned before, the concept has changed with Emília Ferreiro's and Ana Teberosky's studies, in the 1980s, about the cognitive mechanisms children use to learn how to read and write and their own conceptions about the written system. According to the authors, the hypotheses raised by the children concerning the written process are very important. The understanding of the construction of the written language starts with the children. To Ferreiro (1985), interpreting what had been seen by the teachers as "scribbles" requires a defined theoretical attitude, that is, in order to evaluate the children's writing it is necessary, firstly, to believe that they do not need authorization to learn, once they already learn a lot of things without anybody's permission.

According to Ferreiro (1985), the studies about literacy were mistaken in a particular situation: they considered only two elements in the process of the written language acquisition, the teacher and the student, forgetting that the written system is the most important object of study. This learning process is formed by three elements: teacher, student and written language. The author, then, formulated the following questions:

How is this system built? Which perceptions do the children have about this system, before attending school? Which conceptions about the written system does the literacy teacher need to teach children to read and write? What are those conceptions' consequences to the literacy practice?

At first, Ferreiro (1985) affirms that the children, before attending school, already have some ideas about the reading process. They live in a world where the written language is present. It does not happen only at school. The children read several forms of written language in their daily life, even without having the intention to do it. They realize, for example, that the pictures near a text are related to each other and to the text. They even find out that in order to read something, it is not possible to use the same letter several times, it is necessary to join different letters to form a word. As we can see, the children have conceptions about the written system before attending school and they do not need any literate adult to tell them that the written system exists.

Children who live in urban centers are nearer the literate world and could have more chances of building their conceptions in less time. Nevertheless, Ferreiro (1985), in her studies, also considered children who live far from the urban centers.

She evidenced that the stages that follow, during the evolution of the hypotheses made by the children about the written language, must be seen by the school, mainly by the teacher, as extremely important, once it was necessary the child's elaboration and cognitive work in order to reach that result of the written system. It is totally different if we think about a text copy, for example.

However, these stages differ by levels or steps and cannot point out which student is left behind or is weak in the achievement of the written system at school. This is not the aim of the levels. The levels (pre-syllabical, syllabical, syllabical-alphabetical and alphabetical), according to the hypotheses of the written language made by the children, are useful to evaluate the degree of evolution of their thought about the written system. In this way, the teacher takes into consideration the construction of the written language made by the child, instead of evaluating him/her with a technique that was systematized.

Considering such conceptions, the teacher develops his/her action understanding of what was once considered a scribble as one of the steps of construction of the writing act. Knowing that, what was first considered a mistake has gained a different meaning. This does not mean that the teacher cannot correct the child's writing, or present him/her models (as a reader or a writer), without allowing him/her to think about what and how to write.

Ferreiro's and Teberosky's studies had a great repercussion in the literacy teaching action and unsettled, in a certain way, those who believed that the efficiency of literacy was in the method chosen. This unsettlement can be historically understood in the teacher`s function, as seen in Oliveira (2008).

Another used term to literacy is "*letramento*" (in Portuguese, there are two different words that refer to literacy). Soares (2004) points out that, at the end of 1970s, the United Nations Organization to Education, Science and Culture (UNESCO) proposed to amplify the concept of *literate* to *functionally literate*, suggesting that the international evaluations about the domain of reading and writing competences would be further instead of only measuring the ability to read and write. However, the author mentions Mary Kato's work (1986) that uses this different term in Portuguese (*letramento)* for the first time in Brazil, even though the concept "literacy" has already been lexicalized in the United States and England since the end of the 19th century.

In order to better explain the variety of concepts destined to literacy, Soares (2010) criticizes: "We have been trying, lately, to attribute a too comprehensive meaning to literacy, considering it a permanent process, that would be extended throughout life, that would not finish after learning to read and write" (p. 15). To this author, the concept "literacy" has been debated under three points of view, and two of them are present in the double meanings of the verbs read and write.

The first characterizes the reading and writing processes (literacy abilities) in a "mechanical" perspective of the written language, in which "being literate" is to have acquired "the ability of codifying the oral language into written language (writing) and deciphering the written language into oral language (reading)*"* (Soares, 2004, pp. 15-16).

The second point of view characterizes the verbs "read" and "write" concerning the apprehension and understanding of meanings, that is, "the literacy would be a process of representation that involves gradual substitutions, that is, from what is near the child to what is far from the child, aiming the communication, the knowledge acquisition, the exchange" (Soares, 2004, p. 16).

The third point of view cited by the author concerns the social aspect of literacy, once this concept is not the same in all the societies and it depends on cultural, economic and technological characteristics to be constituted.

Soares (2004) sees literacy as a representation of graphemes in phonemes and vice-versa, but also see it as a process of understanding and apprehending meanings by means of a written code. According to her, one representation does not annul the other, although she affirms that in her studies both concepts are partially true, given both processes' specificities in the literacy (the systematization of the relations between the phonological system and the graphical system concerning the other kinds of learning and behavior in the reading and writing area) and in "*letramento*" (the other term for "literacy", the ability to use different types of written materials).

Both concepts in Portuguese have suffered, according to the author, an increase in their meaning because of the extent to characterize the social practices. Many illiterate individuals may use certain social practices and, then, have a kind of "literacy". So, Soares (2004) justifies the fact that literacy is not related or does not come before the other Portuguese term "*letramento*".

Soares (2004) and Oliveira (2008) share the idea that the change provoked in the classroom practice, with the arrival of the constructivist proposal, conducted to some mistakes, justifying the oscillations between the pedagogical practices, causing the "uninvention of literacy", term used by Soares (2004) to explain the loss of specificities in this process.

The author concludes that, unfortunately, the children have been literate in the school but not taught how to read and write. This happens because nobody believes that "the literacy process is developed by means of social practices of reading and writing, that is, through literacy activities, and it may be developed in the context of the learning of the relations phoneme-grapheme" (Soares, 2004, 8).

With the analysis of such references, we understand that literacy teaching has been subject of substantial alterations in the conceptions and the political actions that guide the works at the initial grades of the public school. Thus, it is necessary to search for theoretical references that allow us to understand how people are oriented in their daily routine when facing such changes.

The presence of *habitus* in the literacy teacher's didactic choices

Knowing that the choice related to content is limited, once it has to be under the rules established by the program of the Bureau of Education of the State of São Paulo, the choices of the observed teacher are perceived in his actions, in his acting style when facing unexpected facts, in the content, in the control over the discipline and also in the conducts which are opposite to the ones presented in the documents.

Those are the mechanisms incorporated throughout the teachers' personal trajectory, which will mark them for the rest of their lives, which brought to this research authors like José Gimeno Sacristán and Pierre Bourdieu. With those authors, we could understand the teachers' educational practice and actions.

Bourdieu (2009) affirms that "the practices are theatrical roles, executions of musical pieces or plan applications" (p. 86). Through the practices, the individuals assume social roles which give them condition to belong to a group or a place. In the construction of the practices, men became history subjects, authors and actors of a trajectory, in which the "objects are built and not passively registered" (p. 86). Even as actors, they can see "gaps" to improvise, not performing what is only at the script to be read or done. In order to do this, we rescue the principles and mechanisms generated from those practices, which Bourdieu named *habitus*. Would *habitus* unchain the choices that confirm the teaching practice in literacy? Which mechanisms used in the classroom by the literacy teacher allow an analysis through this theory? Before becoming a teacher, the person was a child, he/she has learned principles and family values and has become familiar with the environment where he/she lived, has observed "teacher's models" while he/she was a student, has experienced these professionals' attitudes, behaviors toward their students and all of this has produced in him/her the *habitus* structures. Did those structures, based in the principle of perception and observation of previous experiences, give him/her condition to make his/her choices, even unconsciously? It is *habitus* that guarantees "the conformity of the practices and its steadiness throughout time" (Bourdieu, 2009, p. 90).

According to Bourdieu's affirmation, to any choice the teacher makes, this could be attributed to the experience he has acquired during his trajectory, personal or professional. However, Bourdieu explains that the agents' *habitus* are different, but also they make everything different. To the author, the differences exist by means of social categories of perception, that is, how people "realize" things. The essential point is that although the reading of "how to be" and "how to do" is inside the teacher's trajectory and he is inside a social space, inhabited by other individuals, none of them is above the other and everybody has his own space. Because of that, they could be different.

There may be the same language to the agents of that field, because many actions could be manifested inside the same *habitus*, the same class. The subject has the power of choosing and the condition of reinventing, of creating over what is already known. Let`s imagine, yet, that in a classroom, which is a collective learning

environment, the students' life trajectory, the experiences that they take to that place is crossed with the personal and professional experiences lived by the teacher. It does not seem possible to predict the number of answers that we will find when facing the endless possible situations. However, we could maybe observe, in a systematic way, if there are some practices in the school routine that incorporate, by their frequency, the principles that generated the actions that integrate the *habitus*.

Another Bourdieu's concept that contributes to the data analysis of this work is the practical sense, because it orientates the choices, it anticipates what is coming, it gives meaning to the choice, a reason to exist, promoting a meeting between the *habitus* and the field. According to the author, it is in the field that the game rules, its space and its purpose are established, reproducing conditions to its perpetuation. In order to be part of this game, it is necessary to believe, since "the belief is a constitutive part of how to belong to the field" (Bourdieu, 2009, p. 110).

Bordieu's theoretical proposition to the action brings intriguing issues. Synthetically, we may point out that the actions have, as a generator principle, the practical sense more frequently than the rational calculus. To Chauviré and Fontaine (2003), authors that synthetize Bordieu's concept of action, the agents could be reasonable without being rational; the rationality is practical, not theoretical, and the agents' action motors have their source in another place, that is, in the confrontation between a system of acquired dispositions and a fragment of the social space, acquisition place and the evolution of these dispositions.

According to Bourdieu, it is the notion of the practical sense as dispositional sense that allows thinking about the adjustment of the *habitus* to the field in the action course.

These considerations lead us to think that the choices the teachers make in their daily school routine originate from the constituted *habitus*, but also from the practical sense when the *habitus* faces the new demands of the educational field where they act. How do they relate to the actions to be accomplished? What kind of practical sense do they have?

Gimeno (1999) corroborates with Bourdieu's theory when affirming that the practices are historically built, because "the action brings the mark of other previous actions" (p.70). Those marks, according to him, are left by the experiences, by the effects that generate and by the transformations that may occur in the social context. Such transformations, according to the author, are suitable as basis to new actions. After some time, and after they are incorporated by the subject or the group, they generalize themselves, becoming "guidelines" to the crystalized practices accomplished in the daily routine. "Knowing how to do" characterizes, in a certain way, the style of action. A teacher's life trajectory demonstrates, most of the times, if he has resources or schemes of action. The author exemplifies such fact with the teacher who allows himself to experiment different situations and rich situation throughout his life. The bigger their resources of action, the easier the teacher will "know what to do", concerning the social practices that permeate each action. These practices are shared, imitated and create a social reality or an intersubjective culture. With this, the author wants to say that shared actions are changed into social patterns as soon as they become routine.

The reflection of this historical conscience of the actions is very important, according to the author, because it is through this refection that the teachers will know how to explain the paths already taken and the ones that could be modified. To Gimeno, there is more information about what is thought and desired than about the ways of "knowing how to do". Such affirmation justifies, therefore, the importance of keeping studying the teachers' actions in the classroom. Observing how a teacher acts, how the chooses the best conduct to be taken, how he observes his students, interprets and reacts to their actions is essential, because the educational practice is the only possible foundation to the personal action and this is repeatedly wasted by the teachers in their actions.

The author affirms that "knowing how to do" is not enough. It is also necessary to "want to do" something. Both are, according to the author, essential resources to renovate the settled actions into practices and originate new actions. The author proposes processes of creation of useful routines, once they obey to purposes and once the repetition, in relation to the former actions, could retain the meaning to the individual.

FINAL REMARKS

The production of studies about the literacy theme has been intensified in the last decades, especially since the 1980s, when more extensive results started to appear due to the expansion of the school program to an extract of the population that had not had access previously.

This is a study that also aimed to understand what happened inside the school through the analysis of the didactic choices made to teach children from public schools to read and write.

Once we defined the focus of the didactic choices of this part of the school teaching, we immediately infer, in the educational environment, that those choices are an option in the presence of many other alternatives, especially when we understand everything that had been already proposed.

Taking as reference this scenery and the critical perspective of the analysis about the school, the society and the formation that both provoke in the subjects, we have accomplished a study based in the concepts of *habitus* and practical sense complemented by the concepts of action and practice. Following those concepts, we have started from the postulation that the choices made by literacy teachers would be based in the current educational policy, once the state and municipal governments (in São Paulo), as in other places, have been defining orientations to the schools and their agents for a long time. However, we had no intention to verify whether the teacher followed the current proposal or not. The aim was to detect which choices were made, given the political context, but also considering the other contexts in which the unexpected situations of the reality and the practices solidified as school culture played an important role, choices that the teacher would certainly be saturated.

We used to understand that, even though there were external interferences related to daily aspects, present in all those contexts, the teacher, when "closing the classroom door", used to make his own didactic choices, which give him certain uniqueness, according to the idea that circulates about the teacher's job.

As a consequence of those definitions, a state public school was chosen, as described in the introduction and the initial chapter. At my first visit to the School in Mooca, to present the research that would be done and ask for permission to observe a classroom in the beginning of the literacy process, the coordinator chose a group of students from the 1st grade, because of this group's teacher. Even though I had not met her personally, I started my observation in the classroom knowing that the teacher was indicated to be my research subject because "*she had good control over the children's discipline and she knew how to teach them read and write*". That was a kind of "presentation letter" that defined the teacher's reputation in the school, but, moreover, it was indicating what was valued and expected from those teachers.

According to the teacher's description, we observed that she has lived in the neighborhood since she was born, she studied in public schools until she reached the university and she belongs to a family whose parents did not have the same school opportunity. Her trajectory is similar to her students'. Although she knew that, she had over them a posture of control, which reinforced the submission and the obedience to her commands. According to her, that seemed to be the logic underneath the school system.

In fact, we actually verified that the control was a strong characteristic in her action, that is, imposing herself to her students, demanding – and achieving – "ideal" conducts from the children through the embarrassment she created with her body posture, taking advantage from her physical characteristics and her way of dressing: body *héxis* also expressed by gestures, tone of voice, way of looking and gesticulating, imposing her power over the children. In this way, she worked according to her strategy of maintaining the "good concept". This characteristic ruled the teacher's entire action and allowed her to ascend in her career, since she was indicated to be the coordinator in another school, the year after that.

In a constructivist proposal, like the program adopted by Bureau of Education of the State of São Paulo, in which the perspective is related to critical literacy, the teacher did not have to work exhaustively with one text genre and only after a lot of training, to move on to a more difficult genre. The program is against this practice, which is a characteristic of the traditional pedagogy. At that school, the teachers worked with the characteristics which were peculiar to each text genre that must be understood by the children, because they would, in the following years, elaborate texts to different purposes. Recognizing the kind of text seemed to be the priority.

Part of the choices made was related to the teacher's credibility according to the adopted program. Composing the initial axle to present the scenes, there are choices of activities with contents according to orientations weekly received in the meetings. Those were choices that privileged the different text genres. Until the moment of the beginning the research, I had not known anything about the program adopted by the state schools. I started to understand the program, initially different from the way the observed teacher knew it, without orientation, only through her actions. From the beginning of the research, I started reading and tried to relate the orientations the teacher received in the meetings with her actions in classroom. The intention was not to verify whether she followed the orientations or not, but from the observation I could realize that the choices made by the teacher in her daily school routine with the children, composed the new actions of the program proposal, varying the materials and content to attend the literacy principle.

Due to the second axle of criterion to select the scenes, we could actually verify the teacher's intervention over the children, the importance of the acting to work with the contents of the texts with the children. The teacher's actions could be understood as contradictory concerning the underlying principles of the proposal. It was possible to realize, for example, that any activity that could make the children behave in a freer way, and could make them nosier, would not be accepted by the teacher.

Although continuously receiving orientations about what to do with the materials and how to literate and even believing to do what was proposed, the analysis allows us to point out that the teacher was incoherent,

specially related to the rhythm and to homogenization. We verified that time has been associated to the dynamics of literacy in this group. It was the most important organizer of the activities, propitiating one of the main school learning which was necessary for the rest of the school life. This organization leads itself to the opposite way of the underlying principle to the theoretical base of the proposal, that is, to attend to all the differences among the children, to the diversity of the rhythm of each child's educative work, a principle that, besides being widely spread, does not seem to actually achieve the classroom.

Such fact leads us to homogenization, imposing all the time what has to be done, allowing very few possibilities of variation, experiments, or an attempt to do something according to their own expectations, their life experiences, their likes, when they face the activities that could allow the teachers to attribute other meanings different from the compulsory ones, since the beginning of their school years.

The didactic choices, concerning the way used to teach, were the most difficult situation to the teacher, because the heterogeneity presented by the children in the learning of the written language lead the teacher to opt for copies of short exercises, in order to avoid the children to copy the activities from the board or from the sheet, making them glue those activities in their notebooks. This is also an opposite reality to the one expected to be found in the proposal, that proclaims the teachers' possibility of finding their own way to follow their path, since the technique of reading and writing is controlled, which is fundamental in this phase to all the rest of the proposal. And the teacher actually caused the interdiction of the writing action, favoring the execution of the activity at the right time and at the right way.

The possibility of analysis with the multiple references allowed us to identify that the teacher's didactic choices – like other teachers' choices in these stages of teaching modifications – occur due to the diversity of situations faced in the schools, in which the proposals embrace certain aspects of the daily life, generally its curriculum contents, but they do not embrace all the dynamics that move them. So, the action is, in fact, a mix of implementation of the political action, but it is, above all, the maintenance always renovated of the fixed practices in the school culture that constitute part of the teachers' *habitus* who are active in the impact with the multifaceted reality.

54 - Utilising case study to develop an interpretive theory to address organizational and individual issues in teacher learning in a school site

Patsy Norton

Queensland Academy of Creative Industries, Queensland, Australia
t.model@bigpond.com

Abtract: How to effect teacher learning is a critical concern for many stakeholders, given the prevalence of change in schools. One such stakeholder, a school leader responsible for professional development in a curriculum reform context, took on the dual identity of insider-researcher to address the problem within a particular school site. The article focuses on the value of case study for investigating the issues confronting teachers in their learning and details the interpretive theory developed to address those issues. It presents a comparison of that theory with the literature derived theory about how to address teacher learning within a reform context, to emphasize the tension inherent in the relationship between the particular and the universal, and characteristic of case study paradox.

Keywords: Teacher learning, case study, reform

INTRODUCTION

How and what teachers learn within each school community with its characteristic culture is a matter of considerable interest to both school leaders, whose responsibilities include evidence of improved classroom practices, and researchers whose interests include teacher learning within the contemporary context (Borko, 2004; Johnson & Hallgarten, 2002; Kelchtermans, 2005; Norton, 2006; Putnam & Borko, 2000; Shulman & Shulman, 2004; Smylie, 1996). The interpretive theory detailed in this article, developed from case study research into teacher learning in a large independent school site in Queensland, Australia (Norton, 2006), adds to what is known about teacher learning. It reveals the importance of the nature of the school reform context in determining the interplay between organizational and individual issues challenging teachers in the learning process.

Additional interest lies in the fact that the theory was developed by an insider- researcher utilising case study methodology. Her dual identity was that of school leader (responsible for curriculum reform and accompanying teacher learning) and researcher (enrolled in a professional doctorate) investigating a problem of teacher learning. This insider-researcher role as well as the study's focus on site-specific issues facing teachers in learning within a curriculum reform context made case study an appropriate choice of methodology. These factors also explain why the interpretive theory developed from the study emphasized that an approach taken to support teachers' learning should be a strategic response to identified contextual issues. This was highlighted in an autobiographical comment made in one of the final chapters of the thesis:

> …the particular is not the universal. It is related; it is connected; it mirrors characteristics; but it is also intrinsically a different, unique entity…the site specific theory is more likely to work than an ideal theory. However, if it lacks the genetic characteristics of the parent theory, it will not. I would argue that as an insider-researcher, I value the tension between the two theories, as well as the need for that tension, more than someone who has not experienced the duality of roles (Norton, 2006, pp. 214-215).

There is considerable support for improved understanding of reform in the education context, and particularly for improved knowledge of how to support teacher learning appropriately within contemporary reform contexts (Beattie, 1995; Fullan, 2000; Resnick, 2001; Rosenholtz, 1985; Scribner, 2003; Sleegers, 1999; Zbar, 2002). Similar support is evident at the level of national government in Australia, where leadership in this area has been given to the Australian Institute for Teaching and School Leadership, whose goal is to promote "excellence in the profession of teaching and school leadership" (AITSL, 2011, p. 11). Educators generally are very aware of the importance of professional development for quality teaching (Evans, 2004; Holden, 2002; Rowe, 2004) but there is perhaps insufficient research into what pressures teachers face due to this level of interest (Ballet, Kelchtermans, & Loughran, 2006). In Borko's (2004) overview of the field of teacher professional development research she makes the point (albeit with an American focus) that considerable progress has been made into research in the field over the 20 years prior

to her publication. Further, she recommends what steps should be taken in future design and research into professional development for teachers (2004, p. 12-13). These include:

- Extension of research into all subject areas and all grade levels;
- Adaptation of professional development programs to the particular needs of local sites, with an intent to preserve the integrity of the programs;
- Appropriate resourcing of program and appropriate analysis of the effects of programs, taking account of a particular school's contextual influences and individuals within a context.

Both the second and third points in the list suggest that the "needs of local sites" would be met by research such as that completed by this writer into the organisational and individual issues facing teachers who are challenged to learn new knowledges, including pedagogical knowledge, within a particular school's reform context. Research by James and McCormick (2009) into school community learning supports the importance of considering school-based issues that impact on teacher learning, while Shulman and Shulman (2004) warn that a teacher's learning is continually in interaction with his/her particular teaching community and is not necessarily transferable to other contexts. Given this, the argument that this paper can add to knowledge and understanding about how to approach teacher learning in a particular school site has strong justification.

There is a focus in this paper on the value of case study methodology adopted for my research into "local sites" and the interpretive theory developed within the study to address local issues that challenged teachers' learning. Both were considered an appropriate and justifiable response to the major question guiding the research study, which was:

> What issues do teachers encounter as they attempt to engage in curricular work that is more collaborative, coherent and challenging?

Explanation and justification are provided initially in the paper – first, with regard to the choice of case study methodology, given it was a good fit for the problem and aim of the study, and second, with regard to the choice of interview for data collection. An overview of the analysis of data is provided, including a summation of the findings. The focus is then given to the interpretive theory constructed to address these identified issues in the local site, a benefit of the case study methodology. This is given theoretical perspective through a comparison with the literature-derived theory about how best to approach teacher learning within reform. Finally, the paper addresses what Simons (Simons, 1996) has termed the paradox of case study evident in the tension between the particular (the interpretive theory) and the universal (the literature-derived theory), a tension that has significant impact on an insider-researcher.

CASE STUDY – A METHODOLOGY TO FIT THE PROBLEM

The school curriculum reform, the context for the insider's research, was one that challenged students and teachers from years 1-9 to improve learning outcomes. The reform focussed on the adoption of a learning model and associated learning strategies designed by a dedicated team of academic-consultants and a team of representative school staff over many months. Teachers were challenged to take an integrated approach to learning across subjects, to work in teams at year levels and to base changed classroom practices (especially the implementation of a pack of purposeful learning strategies) on the theory underpinning the learning model. Coherence in learning from Year 1 to Year 9, as well as across subjects, was a key objective, but it was very dependent on collaboration and team work. That is, it was not only the learning about new pedagogies and the conscious application of theory to practice that was challenging. The culture of collaboration and the expectation that teachers be actively participating in the learning community were equally challenging.

In this reform context, what was needed was a methodology that took account of the nature of the community described, one bounded by situation, time and person involved (Merriam, 1988; Stake, 1991), as well as the researcher's insider status and the nature of the problem. It was a what, how and why problem: it was about what issues faced teachers in learning, why those issues were significant and how teachers dealt with those issues (Norton, 2006) in one school site. There was strong support for the appropriateness of case study for this kind of problem in a single case (one school) (Yin, 1994) rather than for the problem in multiple schools (Hammersley, Gomm, & Foster, 2000; Orum & Feagin, 1991).

Case study enabled the views of both researcher and participants to be utilised (Marshall & Rossman, 1999). The methodology supported the researcher's aim, to develop an interpretive theory grounded in the realities described by teachers in interviews. This theory was designed to support a pragmatic approach to addressing issues in teachers' learning, such that it was an "instrument" of use (James, 1978). Further, the design of the study included a comparison of the interpretive theory with the literature-derived theory about how best to approach teachers' learning within a reform context. This juxtaposition of theories gave perspective and

provided a means of controlling any perceived lack of objectivity due to the insider's political influence or cultural knowledge (Cochran-Smith & Lytle, 1999; Dombart, 1985; Tuhiwai Smith, 1999). The process, it is argued, contributed to "theoretical understanding" (Schoenfeld, 1999, p. 10), while the outside-in perspective gained from the comparative process eliminated possible dominance of the inside-out perspective (Darling-Hammond, 1996b; Lieberman, 1992) more likely to be characteristic of case study by an insider-researcher.

Data collection method
Within the reform context of the single school site, and given the researcher's insider status, the interview was used to investigate the realities of learning for selected teachers (Freebody, 2003; Gubrium & Holstein, 2003; Judith Warren Little, 1990; Miller & Glassner, 1997; Noddings, 1992). The selection of the fifteen teachers was based on their ability to be "good informants" (Merriam, 1988) and representative of roles and experience across the year levels of the school. The interviews were semi-structured interviews framed around five domains derived from the genealogical literature search into approaches to teacher learning within reform contexts. These domains included:

- The characteristics of the learning community,
- Places and spaces for learning,
- Learning experiences,
- Construction of knowledge,
- Practices demonstrating teacher learning (Norton, 2006, p. 110).

No complementary methods were utilised, although available in the form of documentation, as the teachers' perspectives on the realities of issues confronting them were targeted and the interview data provided sufficient evidence of the "human affairs" in the case (Stake, 2000).

ANALYSIS OF DATA
An heuristic approach was taken to the analysis of the data, characterised by action and interaction with the data, a process intrinsic to constructing theory grounded in the realities of the data (Dey, 1999). The two dominant categories of issues that emerged from sorting and categorisation of patterns based on patterns, concepts, or relationship between concepts were Biographical Issues and Organisational Issues. These are detailed in Table 1:

Table 1: Summative Table of Issues (Norton, 2006, p. 177)

Domains	Biographical	Organisational
Learning community	Classroom Comfort	A Culture of Change
	Fitting the Bits and Pieces Together	Integration of the Curriculum
	Responsibilities of Managers	Collaboration
	Conflicting Responsibilities	Teams
		Leadership
		Timetable
Places and Spaces	Encroachment on Own Time	Joint Work
	Interaction with Significant Others	Meeting Protocols
	Making a Fit	Reflection and Evaluation
	Quality of Work	
Learning Experiences	Risk Taking	Key Teachers
	Beliefs	
Knowledge Construction	Nature of Knowledge	Overload
	Nature of Talk	
Practices	Knowledge Base	Model
	Accountability	Reporting

These significant issues were further analysed for evidence of patterns termed "regularities" (Hatch, 2002) due to evidence of similarity, difference, frequency, sequence, correspondence or causation. For example, teachers identified the Nature of Talk as a major issue in both organisational and individual categories. It demonstrated both frequency and causation: teachers made direct reference to the issue or to a related aspect in more than one domain; while other issues were exacerbated by the difficulties teachers experienced in engaging in cognitive conflict about the new curriculum. One teacher noted that the kind of "teacher talk"

required was a major issue because "it didn't exist prior to the change in the way we do things" (Norton, 2006, p. 186). Participation in meetings was seen as a risky endeavour and one where people were "quite attacking in what they would say" in discourses that were rigorous intellectual debates (Norton, 2006). These were a natural consequence of the inquiry process characteristic of the learning in the reform context (Cotter, 2003; Kelchtermans, 2004; Little, 2005; Reagan, Case, & Brubacher, 2000).

By adopting this process of identifying regularities, four macro-issues emerged (Norton, 2006, p. 177-187), constituting the key findings of the investigation, as follows:

- Key teachers (Facilitators/support persons are necessary to support the construction of conceptual knowledge and changed practices);
- Joint work (Scheduled opportunities and experiences in appropriate facilities are needed for teachers to learn and to work together);
- The nature of talk (Articulation of tacit knowledge and engagement in cognitive conflict are necessary in the learning new curriculum knowledge);
- Making a fit (Constructing complex conceptual knowledge requires time as well as processes of inquiry, reflection and evaluation.)

Examination of the macro-issues lead to the construction of a set of principles and supporting strategies that represented an appropriate theoretical means of addressing the issues. These principles and strategies are detailed in what follows, along with a comparison of the interpretive theory with that derived from the literature.

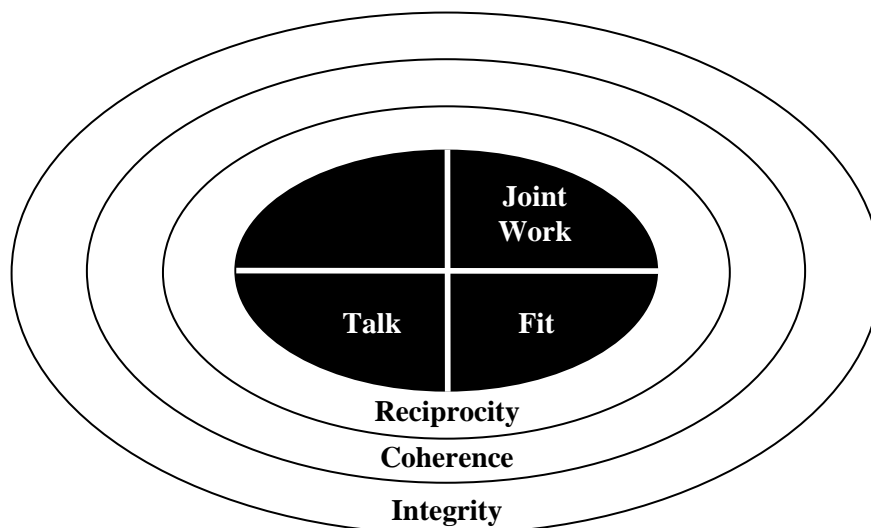
The interpretive theory
Three principles – reciprocity, coherence and integrity – were determined to be necessary elements of a principled approach (Norton, 2006) to teacher learning in the school site. These were derived from close examination of the macro-issues to identify the principles at work within each. Framed by this approach, specific propositions were developed to address each of the macro-issues. In addition, the interpretive theory was compared with what the literature presented as recommended approaches to teacher learning, so that there was demonstrated perspective as well as credibility in the school-specific theory. Figure 1 provides a graphic representation of the interpretive theory developed.


Figure 1: The Interpretive Theory

The first principle, integrity – fidelity between the idea and its application, as well as honesty in professional behaviour - applied to both the organization and the individuals in this site, and reflects the support of theorists. On the one hand, Dinan-Thompson (2002) suggests, in the metaphor of the chookyard, the rooster is in control, and the chooks want to know that the administration is a responsible agency (Dewey, 1915), but they also expect that democratic practices will match the democratic vision as evidence of integrity (Dewey, 1915, 1955; Henderson, 2002; Henderson & Kesson, 2004; Kesson & Koliba, 2002). On the other hand, teachers who are perhaps resistant to reform and pedagogical change (Joyce & Murphy, 1990; Lortie, 1975;

Rosenholtz, 1985, 1989) need to commit to collaboration and the challenge of cognitive conflict within inquiry discourses characteristic of reform.

The second principle of coherence – the construction of meaningful conceptual knowledge and pedagogical knowledge, built on tacit knowledge – was applicable to all macro-issues. In particular, it addressed the contentious and risky nature of what teachers in the study described as the "fierce discourses" about "deep questions" (Norton, 2006, p. 168) that took place in the school's curriculum reform context. These discourses challenged teachers in making meaning and sense from conversations in meetings, because of the level of "constructive controversy" (Johnson & Johnson, 2009; Johnson, Johnson, & Smith, 2000) and resultant stress that characterised many of the meetings. That is, professional conversations in meetings were problematic, perhaps necessarily so, an aspect of teacher learning noted by Sankey (2004). One teacher described participants in such discourses as "quite attacking in what they would say" (Norton, 2006, p. 187). Coherence was a needed principle to address the issue of the Nature of Talk particularly, as well as related issues.

The nature of meaning making and learning was identified in the grafting metaphor adopted as the title of the thesis (Norton, 2006) – *Teacher learning is a process of grafting new truths on to old truths* – and targeted each teacher's need for a biographic narrative that enabled him/her to make links between temporal experiences. It was an approach supported by theorists (Clandinin & Murphy, 2009; Kelchtermans, 2004; LaBoskey, 2006) and echoed the advice that understanding of changed practices is achieved through "existing knowledge and beliefs" (Borko & Putnam, 1995, p. 59). Other learning theorists voice similar support for coherence in learning, emphasizing the need for inquiry and the social construction of knowledge in varied contexts (Anderson, Greeno, Reder, & Simon, 2000; Lauriala, 1998). Further, the situative perspective on learning (Putnam & Borko, 2000), with its emphasis on coherence evident in authentic activities and distributed learning (characteristic of joint work) in purposeful settings, was identified in the study as a fit for the demands of the school site.

The final principle, reciprocity, was about "honesty in the equality of contribution of both parties" (Norton, 2006, p. 195). Teacher resentment resulted when teachers' giving of time, cognitive effort and commitment to a changed collaborative approach were not matched by the organization's giving of time, support or understanding of the cognitive challenge of learning. Keys (2005) offers a similar perspective on the importance of giving, along with acknowledgement of beliefs, in his study of science curriculum reform. This principle targets the macro-issue of Making a Fit more directly perhaps than other issues, because the challenge to learn new knowledge was seen by teachers as work overload – simply more of their "own time" (Norton, 2006, p. 196), something precious to them. Even though teachers are acknowledged as "poor knowledge sharers" (Fullan, 2002, p. 3) with strong loyalties to established truths (James, 1978) theorists tend to support the critical need for a school to consider how much teachers can or should give without reciprocal giving by the school (Fullan, 2000; Little, 1986; Zbar, 2002, 2003).

Within the framework of principles illustrated, four propositions were developed, targeting the macro-issues, as listed:

- Key Teachers: Teacher learning of complex conceptual knowledge requires Key teachers as facilitators.
- Joint Work: Scheduled (timetabled) opportunities and experiences in appropriate facilities should be provided for teachers to learn and to work together.
- The Nature of Talk: The nature of talk in teachers' learning should encourage the articulation of tacit knowledge and reflect engagement in cognitive conflict.
- Making a Fit: Teachers should engage in inquiring, reflecting and evaluating over an extended time to construct a conceptual understanding of the curriculum.

These propositions addressed context-specific issues, especially what are termed the "institutional practices" (Aspin, 2002, p. 12) adopted in a school. They represented the application of the idea, rather than the idea itself, to issues in the community of practice (Palinscar, Magnusson, Marano, Ford, & Brown, 1998).

The first proposition targeted the need of teacher-learners for a facilitator who was part mediator/manager and part coach (Norton, 2006), someone with specialised knowledge of the curriculum changes and with allocated time for working with teachers both in and out of the classroom. The key teacher's role was to assist teachers in the process of making meaning and thereby achieving coherence in learning. The role also included management of meetings, such establishing ground rules that supported positive intellectual debate (Darling-Hammond, 1996a) and group dynamics, given the level of cognitive conflict that was identified as part of the joint work situations in the school. Further, the role was that of coach, working inside the classroom with individual teachers to support changed practices and engage in reflective dialogue

(Garmston, 2005; Schon, 1983). It was envisaged that this Key Teacher would also be the liaison person working across subjects to assist in integrating the curriculum. Essentially, the Key Teacher was seen as the facilitator for shared learning, thereby supporting the characteristics of the situative perspective on learning (Putnam & Borko, 2000) identified as a fit for the school situation in the literature, as well as enacting the principles of coherence, integrity and reciprocity guiding the approach overall.

The second proposition reflected the emphasis on the macro-issue of Joint Work by teacher interviewees, who had noted the lack of spaces and places for shared learning and social interaction in specific situations. It was a strategy recommended by the theorists (MacPherson, Aspland, Brooker, & Elliott, 1999; Putnam & Borko, 2000) and one that resonated with Thayer-Bacon's (2000, p. 5) emphasis on the construction of the quilt of knowledge as a "transactive sociopolitical process with others". The proposition was intended to reduce perceptions that teachers were constantly finding the time for meetings and for learning, and were unable to reflect with others on complex conceptual knowledge and changed practices. It met the criticism of a teacher who complained of lack of integrity by the organization in not providing time for learning (Norton, 2006) and for making sense of the new curriculum knowledges.

The macro-issue of the Nature of Talk has been noted as a significant issue. It was a difficult issue to address but the third proposition clarified what challenged teachers in meetings and focussed on teachers' need to feel confident that their tacit knowledge and beliefs were acknowledged and valued in cross-subject and cross-year meetings with teachers of varying backgrounds and ages. The proposition was intended to encourage teachers to talk about tacit knowledge as a means of constructing new knowledge and maintaining a sense of order or meaning in their lives (Crebbin, 2000; Little, 1992) but this was challenging for teachers. One commented that she was perceived as a "show-off " because she described her changed classroom practices (Norton, 2006, p. 206). In addition, data from this study clearly demonstrated that the teachers in this school site were not accustomed to constructing complex knowledge with others (Norton, 2006, p. 208), which is why the role of the Key Teacher (proposition one) was so critical in facilitating this approach to learning.

The fourth proposition complemented the first three with its emphasis on processes of learning. It targeted both the literal aspects (work overload, conflicting duties) and metaphoric aspects (constructing new knowledge, reflecting, changing beliefs) of Making a Fit. In terms of the grafting metaphor used in the title of the thesis reporting on the study, teachers needed time for the graft to "take", an approach given considerable support (Cochran-Smith & Lytle, 1999; Henderson, 2002; Windschitl & Buttemer, 2000). Hence the strategy was intended to give teachers time to engage in inquiry, reflection and evaluation and to talk to others so that there was intellectual development, defined as "a process of growth from a state of relative psychological rigidity toward increasing flexibility" (Hill, Crevola, & Tucker, 2003, p. 2). One of the teachers described this more simply as a concept map construction "starting off with a few big balloons and a few connections and then it gets more and more complicated" (Norton, 2006, p. 210). Ultimately the proposition was about promoting coherence and reciprocity in learning discourses such that teachers were able to construct complex conceptual knowledge with each other.

These four propositions were devised to function within the framework of principles as strategic means to address the macro-issues identified from the analysis of data. What was most notable, however, was that the propositions, like the issues, were unique to the one school site.

The paradox of case study

The previous discussion of the interpretive theory resulting from the research identified broad similarities between the principles framing that theory and those espoused in the universal (literature-derived) theory. The propositions targeting specific macro-issues reflected the focus on the contextual conditions of the school site in applying those principles to identified local issues, thereby highlighting the uniqueness of the single case. The nature of this interpretive theory provided the insider-researcher with significantly improved knowledge an understanding the "the interpretive theory was paradoxically independent of the ideal/universal approach. It emanated from real issues identified by individual teachers in a specific context" (Norton, 2006, p. 214). There were, surprisingly, critical differences between the particular and the universal theories. For example, the interpretive theory focussed on how to support teachers to talk about conceptually difficult knowledge, to articulate tacit knowledge and beliefs within conversations considered risky and difficult, with the goal of attaining coherence in learning and providing evidence of reciprocity and integrity on the part of the organization and individuals (Norton, 2006, p. 227). The literature-derived theory did not address the particular combination of factors peculiar to the site within such a principled framework.

Simon's (1996) exploration of the paradox of case study has provided a similar emphasis on the need to understand why a particular case can be similar to, but not the same as, the general or universal set of cases,

just as a particular theory may display critical differences but broad similarities to the universal theory. Understanding this tension between the particular and the universal is critical, it is argued, to what Flyvbjerg (2006, p. 236) defines as "advanced understanding" of how to address the problem of teacher learning in one site. His perspective, however, is based on the belief that such understanding comes from being an insider utilising case study methodology in proximity to the realities of teacher learning. I would argue that such understanding also comes from the constant awareness of the tension between the particular and the universal generated in case study of the single site.

CONCLUSION

This paper has provided details of an interpretive theory derived from case study methodology to address issues in teacher learning in one school site. The emphasis has been given to the strategic nature of the theory, given it was a response to the contextual issues, not a one-size-fits-all approach, even though similarities with literature-derived theories were acknowledged. As such, the paper has met a perceived identified need identified for investigation into school-based issues that impact on teachers' learning. While the interpretive theory was the focus of the paper, considerable attention has also been given to the value of case study, firstly, for the nature of the school-based problem, and secondly, for its ability to generate a significantly improved understanding by the insider-researcher. Such understanding is two-fold: it is about both a deeper theoretical understanding that comes from a deliberate comparison of the particular and the universal theory, and the personally significant understanding of the insider-researcher who appreciates, as a consequence of applying case study methodology to a single site, the need to value and maintain the tension between the particular and the universal.

57- Academics' Perceptions with respect to their Teaching, Research and Management

Katia Caballero Rodríguez

Faculty of Education Sciences, University of Granada, Spain
kballero@ugr.es

Abstract: Spanish Universities are in a process of change towards the European convergence to reach higher quality levels in higher education. As a part of this process, it is essential to analyse the conditions in which teachers undertake their duties. The main aim of this paper is to make known how academics feel with respect to their duties at the University: teaching, research and management. The design of this research is based on a combined use of quantitative (questionnaire) and qualitative (biographical-narrative interview) methods. The questionnaire was administered to the whole of academics from the University of Granada, and the sample was composed of 1062 academics, which is equivalent to 35.4% of the population. The obtained results show that most of academics perceive themselves more like teachers than researchers. Also, there are significant differences in how academics conceptualize teaching and research.

INTRODUCTION

The transition to a common area of Higher Education is a rethinking of the concept of teaching. In this sense, academics are one of the main agents that can make the change possible. They must develop a professional profile that allows them to respond appropriately to new challenges and demands that are emerging in the new knowledge and information society.

Academics must change their mentality and realize that they must focus on students learning in order to prepare participative and active professionals and citizens for the future. In order to achieve this, they need a commitment to acquire cognitive, educational, communicative, social and emotional competencies to develop quality teaching.

The professional profile refers to the set of skills and competences to identify the training of a person, doing possible the responsible development of several duties within a profession. In this case, Zabalza (2009: 75) argues that academics have a double identity, as they are specializing in a scientific field and, at the same time, they have to specialize in the development of teaching and learning procedures for their disciplines.

However, these specialization processes differ depending on whether we refer to research or teaching activity. While research has a broad formative support through masters and PhD; in the teaching activity, although academics may voluntarily participate in training processes, they do not need to prove that they are competent to teach. Therefore, as Zabalza (2009: 79) defends *"university teaching will not improve (if that is the point in this tortuous European convergence process) if academics' training, their professional identity and their competences as teachers are nor strengthened".*

The academics' professional profile has to be created in a personal and responsible way, through the involvement in training processes that could prepare and motivate them to carry out the necessary changes. For this purpose, it is also essential to have institutional support at all levels in order to promote from the top the importance and value of excellence in teaching.

Although there is a need to enhance teaching development and improvement, this will not be possible if academics' prestige keeps depending more on research than on teaching. Nowadays, in order to promote and get incentives, academics are more valued and recognized for their research than for their good practices on teaching.

> *"Both, professional recognition and economic and promotion incentives, attributed to an excellent research work, contrast with the low importance given to quality teaching practices in the University"* (Mérida, 2006: 5).

In this regard, Valcárcel (2003: 36) gives us an example: "... in the hypothetical case of two professors, one of whom has only incentives for his/her research and other who has only incentives for his/her teaching, the first one is allowed to participate as a member of a board of examiners, while the second one is not".

For this reason, new academics that access to the University assume this culture in which recognition is measured by quality in research, but not by excellence in teaching. Therefore, for their promotion it would be better to focus on research. This entails negative consequences for university students, since the quality of their training is impaired.

It seems essential to increase the prestige of teaching, so that academics feel more motivated and involved in the improvement and professionalization of this activity.

It is also necessary to encourage an integrated evaluation system which recognizes a balanced set of activities carried out by teachers during a concrete period of time. Besides, it must be taken into account if academics connect their research with their teaching, because most of the time they are developed separately.

This paper aims to show how academics perceive themselves as teachers, researchers and, where appropriate, other, and to find out if there are significant differences between academics' perceptions depending on their age, gender, years of experience, academic rank, scientific branch, etc.

METHOD

In this research it has been used a combined procedure: the quantitative method, through a questionnaire, and the qualitative method, through biographical-narrative interview.

In this paper are described some of the results obtained through a questionnaire titled "Construction and development of the professional identity of academics" (Spanish version). This instrument was validated by experts and designed as a Likert scale set by 113 items. On this study we have focused on those related to how academics perceive themselves as teachers, researchers and, where appropriate, other. These aspects are scored by a scale of five values: 1=Nothing; 2=Little; 3=Average; 4=Quite a lot; 5=A lot.

At the same time, in order to complement the quantitative study, part of the information obtained from several case studies will be shown in order to study academics' perceptions in depth.

POPULATION AND SAMPLE

The population of this research is composed by the academics from the University of Granada (Spain), tenured and not tenured occupying one of the following academic ranks:

Table 1: Equivalence for academic ranks

Hired Academic Positions:	
• Contratado Doctor: is tenured, non-civil servant and must hold a PhD. Equivalent to Associate Professor.	**CD**
• Ayudante Doctor: is non-tenured and must hold a PhD. Equivalent to Assistant Professor.	**AD**
• Ayudante. Similar to a Lecturer.	**A**
• Others:	
o Colaborador: does not have to hold a PhD (to be phased out with the new legislation);	**Col**
o Asociado: does not have to hold a PhD but must have professional experience outside the University)	**Aso**
University Academic Positions:	
• Catedratico de Universidad: is tenured and civil servant. Equivalent to Full Professor.	**CU**
• Titular de Universidad: is tenured and civil servant. Equivalent to Professor.	**TU**
• Catedratico de Escuela Universitaria: is tenured and civil servant (to be phased out).	**CEU**
• Titular de Escuela Universitaria: is tenured and civil servant, does not have to hold a PhD (to be phased out).	**TEU**

For this investigation, all population was invited to fill in the questionnaire, getting a total of 1062 responses that represent 35.4% of the population. They are distributed through the different categories as shown in the following table:

Table 2: Population and sample distribution according to academic ranks

	Population	Sample	% Population	% Sample	% Total
CU	396	151	13.2	14.2	38.1
TU	1486	523	49.5	49.2	35.2
CEU	64	18	2.1	1.7	28.1
TU	171	55	5.7	5.1	32.1
CD	291	124	9.7	11.6	42.6
AD	67	28	2.2	2.6	41.8
A	83	27	2.7	2.5	32.5
Col	201	61	6.7	5.7	30.3
Aso	239	75	7.9	7.0	31.3
TOTAL	*2998*	*1062*	*100%*	*35.4%*	

After calculating the value of Pearson Chi-square, it was found that the academic ranks obtained in the sample are a representative subset of the population.

RESTULTS
In order to analyze the questionnaire responses, a double procedure has been followed: a descriptive study to determine the distribution of frequencies for all variables in the questionnaire and, secondly, a contrast study (causal-comparative) to determine the differences and similarities in their responses from an illustrative set of variables such as sex, age, branch of science, academic rank and years of experience.

Descriptive study
Table 2 shows the results obtained after crossing the descriptive variables of the questionnaire with the items related to how academics perceive themselves as teachers, researchers and other.

Table 3: Frequency distribution of how academics perceive themselves

	Nothing	Little	Enough	Much	A lot	Total
1. You perceive yourself as a teacher	6	20	90	389	554	1059
	0.6%	1.9%	8.5%	36.7%	52.3%	100.0%
2. You perceive yourself as a researcher	21	73	226	394	335	1049
	2.0%	7.0%	21.5%	37.6%	31.9%	100.0%
3. You perceive yourself as other	13	22	39	85	63	222
	5.9%	9.9%	17.6%	38.3%	28.4%	100.0%

For item 1, 1,059 academics indicated how they perceive themselves as teachers. From those, 89.0% see themselves as teachers in a much and a lot degree, while only 11.0% feel teachers between enough and nothing. The median shows that academics perceive themselves as teachers much, and the mode shows that the highest number of frequencies is located in those academics who perceive themselves as teachers a lot.
With regard to item 2, with a total of 1,049 responses, a decrease from the previous item can be appreciated, as only 69.5% of academics perceive themselves as researchers in a much and a lot degree. The rest of the academics (30.5%) see themselves as researchers between enough and nothing, although there is a general tendency is for the central score (enough). In this case, both median and mode are located in a much degree.
The item 3 has only been marked by 222 subjects, distributed as follows:
- Managers = 52.7%
- Professionals: 23.8%
  - Arts and Humanities = 4.0%
  - Health Sciences = 10.8%
  - Social Sciences and Law = 5.4%
  - Engineering and Architecture = 3.6%
- Unspecified = 13.1%

Out of the total, 36.7% perceive themselves as "other" in a much and a lot degree, and 33.4% between enough and nothing.

As can be seen, both number of responses and scores, academics from the University of Granada perceive themselves more as teachers than as researchers, although both scores lean toward higher values (much and a lot).

Contrast study

In this section, an inferential analysis was carried out to determine to what extent academics perceive themselves as teachers and researchers.

The variables used to establish differences between academics from the University of Granada, for each item, were thirteen: sex, age, level of family responsibility, scientific branch, faculty/college, department, studies degree, academic rank, previous management position, current management position, years of experience as university teacher, teaching in other educational levels, other occupation.

As shown in Table 4, the item that contains the highest number of significant variables is the second one, which refers to how academics perceive themselves as researchers, with ten variables: age, family responsibility, branch scientific, faculty/college, department, studies degree, academic rank, years of experience, teaching in other educational levels and other occupation. Secondly, we have item 1 with eight significant variables; and finally, item 3, with only two.

Almost all variables are significant in one or two items, except the variables "sex".

Table 4: Significant descriptive variables with respect to how academics perceive themselves as teachers, researchers or other

	Teacher	Researcher	Other
Sex			
Age	x	x	
Level of family responsibility	x	x	
Scientific branch	x	x	
Faculty/College		x	x
Department		x	
Studies degree	x	x	
Academic rank		x	
Previous management position	x		
Current management position	x		
Years of experience	x	x	
Teaching in other educational levels	x	x	
Other occupation		x	x

Next, we discuss the results obtained on how academics perceive themselves with respect to their professional duties:

- *How academics perceive themselves as teachers*

For this item, significant differences were observed in eight variables: age, level of family responsibility, scientific branch, academic rank, past management position, present management position, years of experience and teaching in other educational levels.

The average of academics who perceive themselves as teachers is "much" and below we discuss the most relevant results.

For the variable "age", was drawn that older academics perceive themselves more as teachers. Therefore, those who are older than 55 years old valued with a higher score the degree in which they feel teachers, followed by teachers aged between 41 and 55, those aged between 30 and 40, and finally, those under 30 who have rated the item with the lowest scores.

> *"... With teaching (...) you feel fulfilled, because you see... Research is often nice, the results are gratifying, you publish, you supervise thesis and that's all great, but with teaching you see that you are doing more, the results are more direct. And when a student finishes the career and he comes to see you after two or three years to greet you and tell you how things are going with him, all that is a positive feedback "* (Diego, more than 55 years old e. 1: 3).

According to the average ranks obtained for the variable "scientific branch", there are significant differences. Academics from Social Sciences and Law, Arts and Humanities, and Sciences are the ones that perceive themselves more as teachers. They are followed by academics from Health Sciences, and finally, by academics from Engineering and Architecture, with the lowest scores.

The variable "academic rank" also presents significant differences, which can be grouped so that: CEU, Col and CU are those who perceive themselves more as teachers. Next, TU and TEU. And finally, academics who feel less as teachers are CD, Aso, A and AD (see Table 1).

> *"... Teaching is essential in my life (...). When I get to class I become someone else (...). My students are involved; they are quiet and they ask many questions (...). They transform me and give me energy, it's a non-stop; they give me energy (...). I think that's one thing I could not stop doing, I love it"* (Gema, Col, e.11: 3-4).

The results for the variable "years of experience" identify with those obtained for the variable "age". Academics with more years of experience see themselves more as teachers, and the order of highest to lowest identification with teaching is as follows: 1. Over 30 years of experience; 2. Between 21 and 30; 3. Between 11 and 20; 4. Between 5 and 10 years; and 5. Less than 5 years of experience.

Also, the variable "teaching in other educational levels" shows that academics who have taught in other educational levels perceive themselves as teachers more than those who have only taught in the university.

- *How academics perceive themselves as researchers*

For this item, significant differences were observed in ten variables: age, level of family responsibility, scientific branch, faculty/college, department, studies degree, academic rank, years of experience in university teaching, teaching in other educational levels and other occupation.

The average of academics perceive themselves "much" as researchers and below we comment the most relevant results.

For the variable "family responsibility", academics who have no family responsibilities or a low level of responsibility, identify themselves more with the research activity that those who have a high level of responsibility.

The level in which academics perceive themselves as researchers varies depending on their scientific branch. In this sense, academics who perceive themselves more as researchers are from Science, followed by academics from Arts and Humanities. Academics from Health Sciences, Engineering and Architecture, and Social Sciences and Law had the lowest score for this item.

Among the twenty faculties/colleges to which the questionnaire was administered, significant differences were found. According to the average range, the five institutions whose academics perceive themselves more as researchers are: 1. Faculty of Science; 2. School of Psychology; 3. Faculty of Political Science and Sociology; 4. Faculty of Translation and Interpretation; and 5. Faculty of Arts. By contrast, institutions that had the lowest degree of identification with the research activity are: 1. College of Health Sciences; 2. College of Technical Architecture; 3. Faculty of Work Sciences and College of Social Work; 4. School of Architecture; and 5. Faculty of Dentistry.

The responses of the different departments also differ. The departments whose academics gave high scores to this item are: 1. Soil Science and Agricultural Chemistry; 2. Spanish Literature; 3. Ecology; 4. Physiology; 5. Theoretical Physics and the Cosmos; 6. Mineralogy and Petrology; 7. Political Science and Administration; 8. Geometry and Topology; 9. Radiology and Physical Medicine; and 10. Biochemistry and Molecular Biology II. By contrast, the departments with lowest scores for this item are: 1. Physiotherapy; 2. Surgery and its specialties; 3. Nursing; 4. Accounting and Finance; 5. Didactic of Social Science; 6. Obstetrics and Gynecology; 7. Architectural; 8. Social Work and Social Services; 9. Pediatrics; and 10. Stomatology.

For the variable "studies degree", there are obvious differences between doctors and teachers who are not doctors, because the former perceive themselves more as researchers than he latter.

According to the average ranks obtained for the different academic ranks, it appears that CU, AD, CD and A, perceive themselves more as researchers than the rest. They are followed by CEU, TU and Col. Finally, Aso and TEU have the lowest score (see Table 1).

> *"... Research is essential for me, because your research feeds your teaching. Without research, that is, if you don't advance in your field, your teaching will be poor"* (Lucia, AD, e.12: 3).

The years of experience are also significant for this item. Academics who perceive themselves as researchers are ordered from most to least as follows: 1. Those with less than 5 years of experience; 2. Those with more than 30; 3. Those between 5 and 10; 4. Those between 21 and 30; and 5. Those between 11 and 20 years of experience.

> *"For me a good teaching cannot exist without a good research, because otherwise you'd be bringing them only what others have said, and one has to check that... My vocation is to go to the sources and interpret them myself"* (Jose, more 30 years of experience, e.3: 9).

For the variable "teaching in other educational levels", it is clear that academics who have not worked as teachers in other levels perceive themselves more as researchers than those who have taught in other educational levels.

Finally, for this item should be noted that those academics who have no other occupation perceive themselves more as a researcher than those academics who have other occupation.

- *How academics perceive themselves as other*

The average of academics who perceive themselves as other is "much" and there are significant differences for the variable "faculty/college". Academics who perceive themselves more as "other" belong to the following faculties/colleges: 1. Faculty of Education and Humanities of Ceuta; 2. Faculty of Work Sciences and College of Social Work; 3. Faculty of Arts; 4. Faculty of Translation and Interpretation; 5. Faculty of Medicine; and 6. Faculty of Education and Humanities of Melilla; 7. College of Health Sciences, 8. College of Communication and Information; 9. Faculty of Economics and Business; and 10. Faculty of Dentistry.

CONCLUSIONS

The number of academics who identify themselves as teachers is higher than the number of academics who identified themselves as researchers. Therefore, we observe that 89% of the academics perceive themselves as teachers in a "much" and "a lot" degree; whereas 11% of the academics perceive themselves as teachers in a "enough", "little" or "nothing" rate. According to the facts mentioned above, the following statements have been proven:

- Older academics with more experience in the field perceive themselves as teachers in a higher degree.
- Academics from Social Sciences and Law, Arts and Humanities, and Science are more likely to identify themselves as teachers.

> *"I like teaching more than research and management (...).For me is essential to know how to convey to people. In my opinion there needs to be creativity in the teaching process, and have a good memory when students finish their studies."* (e.5: 3-4).

- Civil servant academics and collaborators are more likely to recognize themselves as teachers.

On the other hand, 69.5% of the academics consider themselves as researchers in a "much" and "a lot" degree; whereas 30.5% consider themselves as researchers in an "enough", "little" and "nothing" levels. In addition, it has been proven that:

- Academics from Science perceive themselves more as researchers.
- Non civil servant academics and university full professors identify themselves more as researchers than the rest of the academic ranks.

Unpacking the offered results for teaching and research activities, it could be concluded that academics, in general, tend to feel more identified with and interested in teaching, something that gives them more motivation for their practice. Subsequently, more time and effort are dedicated to prepare it. Therefore, academics possess a greater control over their practice, although always from the isolation that this practice seems to imply. However, this high level of satisfaction becomes unbalanced due to the inexistence of a structured system of training, evaluation and incentive that could heighten and promote this activity. This provokes a lack of amplitude, diffusion and repercussion of such advances within the University community.

It is clear that there is a discrepancy in the way in which teaching and research are conceived and developed; mostly, they are activities disconnected. Training, evaluation and incentives systems for teaching and

research are relevant aspects that influence this separation and, also, determine the academics' conceptions about their professional duties. For this reason, it is crucial to emphasize the necessity of creating structures which will guide the professional development of academics towards teaching and research integration, and which will support the construction of their professional identity according to the appeals of the University and the society.

60 - Researching Impact of Targeted CPD on Teachers' Professional Attitudes and Classroom Practices

Martin Braund[1], Fred Lubben[2], and Judith Bennett[3]

Department of Education, University of York, UK
[1]martin.braund@york.ac.uk; [2]fred.lubben@york.ac.uk; [3] judith.bennett@york.ac.uk

Abstract: In England there is a national priority to improve science teaching. One action has been to provide high quality Continued Professional Development (CPD) through a National Network of Science Learning Centres (NNSLCs). This paper reports a two year evaluation of courses provided across the NNSLCs to see what impact there has been on teachers' attitudes to CPD and their classroom practices. It was possible to explore differences in impact due to the mode of organisation and content focus of courses. An on-line survey of 1800 participants was used and case studies, involving interviews and document collection and analysis, were carried out in 22 schools. There were impacts from all modes but multi-contact CPD seems to provide a space from which deep and lasting changes in pedagogy and to policy can arise. Time away from lessons that disrupts teaching is an important factor in deciding course type. Various factors in schools can facilitate or hinder impact from CPD courses and these are exemplified and discussed.

Keywords: science education, teacher education, professional development, impact and evaluation.

INTRODUCTION

High quality, sustained Continued Professional Development (CPD) for teachers is one of three characteristics of the world's highest performing education systems, the other two being; recruitment of the highest quality graduates and quality instruction for learners (Barber and Mourshed, 2007). In the UK, as in many other countries, the government is concerned about declining student interest and engagement in school science that has resulted in lower numbers of students taking science subjects at higher levels, affecting the supply of future scientists and technologists (Royal Society, 2006). To address national problems in science education in England, actions have taken place against all three of Barber and Mourshed's characteristics for high performing systems, but it is in CPD for STEM subjects (Science, Technology, Engineering and Maths) that investment and efforts have had the highest profile.

The National Network of Science Learning Centres (NNSLCs) was established six years ago with substantial government and charitable funding to provide Continuing Professional Development (CPD) at one National Science Learning Centre (NSLC) and nine regionally based centres, known as Science Learning Centres (SLCs). The SLCs are mostly based in Institutions of Higher Education and offer courses for science teachers, school technicians and others of short duration (up to three days, but most commonly one or two days). The NSLC was provided with residential facilities and can therefore offer longer courses. Two-part courses are common at the NSLC and comprise blocks of two or three days separated by weeks or months back at school. There are a few courses that involve three or four blocks of training, more often aimed at existing or potential managers or coordinators of science in primary and secondary schools. The other distinct characteristic of the NSLC is that it can provide courses for the devolved nations of the UK, whereas the regional centres are for England only.

The CPD provision is targeted at supporting science teachers and other professionals such as technicians and classroom assistants in gaining knowledge, skills and confidence needed to change their practice in a number of key areas seen as contributing to better science teaching and learning in schools. These include science-specific areas such as the use of contemporary science in teaching, implementing new initiatives in the science curriculum (such as to do with teaching, learning and assessment, practical work and ICT) and more general areas such as leadership and management of change. The aspiration for the programmes is to embed CPD in teachers' professional practice such that it impacts on teachers' attitudes to professional development, on their classroom practices, on pupils' experiences in learning science and on pupils' attitudes towards school science and science more widely. Between 2005 and June 2009, the NNSLCs delivered over 70,000 training days to primary and secondary teachers and other professionals in science education. It is estimated that in 2008/09, the NNSLCs engaged in one way or another with 72% of all maintained secondary schools in England (Holman, 2009).

The research reported in this paper is from a two-year evaluation of the classroom impact of a range of courses provided by the NNSLCs. Other studies of CPD operated by the NNSLCs have been of a semi-formative nature in the early development of the network (Wellcome Trust, 2008) or have concentrated on changes in teachers' subject content knowledge for science teaching (Scott, Ametller and Andrews, 2010). The purpose of this research was to explore impact of CPD on science teachers' pedagogical practices manifested in classrooms and the factors that facilitated and hindered processes of implementation of actions associated with the CPD. Additionally, it was possible to explore these impacts for different modes (durations and styles) of CPD; single day, multi-day, sequences of contact or bespoke delivery of courses designed for specific client groups such as individual schools or groups of schools.

STUDIES OF CPD IMPACT

Guskey (2002) differentiates between five levels of impact of an intervention. At the most basic level (1), the CPD may affect the participant's experiences. At the second level (2) the CPD may impact participant's knowledge skills or attitudes, including confidence. At level 3, the school organisation may be changed as a result of the intervention. Level 4, reflects impact on participant's actions in the classroom and level 5 reports impact in the form of changes in pupils' knowledge skills or attitude. Our studies focussed mainly on factors influencing Levels 3, 4 and 5, according to Guskey's scheme, where evaluation has, traditionally, been less frequent.

Comprehensive impact studies (especially, Desimone *et al*., 2002; Garet *et al*., 2001) across a variety of CPD projects in the US, identified nine characteristics influencing classroom change. They concluded that high-impact programmes focus on CPD content with externally-imposed objectives (e.g. assessment standards) and deal with professional content knowledge (PCK) of new curriculum aspects. The impact is also high if the CPD uses a transparent planning process, formative evaluative cycles, allows for active learning of participants, is implemented in close collaboration with local education authorities and covers an extended period of time. Classroom impact increases if the CPD experience addresses teachers' goals, and links closely with the reality of schools. A subsequent study by Penuel et al. (2007) addressed critiques that the previous studies by Desimore et al.(2002) and Garet et al. (2001) had focused on the CPD provision and less on the implementation context (cluster, school, department, class) within which experiences were embedded. Penuel et al. (2007) found that classroom impact increases when the CPD content emphasises subject content and PCK or the teaching of inquiry methods. The impact is influenced by the total number of CPD hours. Loxley et al. (2007) differentiate between various types of contexts influencing CPD impact, the teaching context, school context and systemic context. Thus, in Loxley's terms, in the US studies reported above, systemic context is the driving force and the school context is the implementation setting. It should be noted that in our studies the NNSLCs works in an environment where the teacher and school contexts are the driving forces and the systemic context is the implementation setting acting as a backdrop to CPD.

Describing the forces driving professional development of British teachers, Day and Gu (2007) identify teachers' need for variation and renewal during their professional life in order to remain an effective teacher. Based on a 4-year longitudinal study using data from more than 300 primary and secondary teachers from a stratified sample of schools in England, Sammons et al. (2007) concluded that strong teacher resilience is expressed, amongst others, as change in classroom activities. They suggest that CPD experiences strengthen classroom impact if the CPD experience takes account of personal, workplace and external factors. More specifically, Boyle et al. (2005) explored the relationship between the characteristics of the CPD provision and impact on classroom practices. More than three quarters of their sample of 800 primary and secondary teachers across England, participating in long-term professional development activities, reported changes in lesson planning, assessment approaches and/or teaching style (Boyle et al., 2004).

In terms of CPD programme duration, Hammond et al. (2009) established that only programmes with more than 30 hours contact time over an extended period of several months show statistically significant positive outcomes on student learning (level 5 impact, according to Guskey, 2002). Cordingley et al. (2007) surveyed the nature of the CPD support provided by specialists (from inside and outside the school) in interventions of more than 12 weeks. Classroom impact had a large component of participant autonomy, allowing structured time for teachers to develop bespoke materials and strategies which would be supported when applied to their own practice. Although little research has been undertaken on CPD support through short, specific, and targeted interventions, received wisdom assumes 'more input, more impact' (see also, Adey, 2004). An illustration of a study of the classroom impact of a short CPD workshop to support the teaching of Earth science at KS3 is provided by Lydon and King (2009). They analysed questionnaire responses for classroom impact plus baseline data for the state of pre-workshop teaching of Earth science in 15 participating schools. After one year all schools reported long-term changes, to various degrees, as evident from changed schemes

of work to accommodate practical activities promoted at the workshop. Half of the schools reported considerable impact, adopting most or all of the proposed activities. The reported impact resulting from a 90 minute workshop contradicts earlier reported research suggesting that CPD needs to be sustained for impact to occur. Lydon and King (2009) point out characteristics of the successful CPD intervention; it was grounded in an explicit theory of learning and promoted tried-and-tested teaching methods supported by high quality and detailed materials for a newly constituted area in the curriculum. Also teachers, who attended as whole science departments in the school-based CPD workshop, were encouraged to work in groups and share experiences and so to take ownership of the changes. These findings suggest that appropriate CPD content and a facilitating school context can offset absence of desirable features of the extended CPD.

METHODS
The studies reported addressed the following research questions:

RQ1: What is the nature and extent of teachers' professional change in classroom activities as a result of participating in selected CPD programmes?

RQ2: What are factors facilitating or hindering classroom impact of selected CPD programmes?

RQ3: How does the mode (course duration/delivery style) of courses affect impact of the selected CPD programmes?

Sample
Data were collected from participants in 28 selected courses provided at regional Science Learning Centres (SLCs) and at the National Science Learning Centre that took place between June 2009 and April 2010. Participants were from primary and secondary schools with larger numbers from the latter. Courses were selected on the basis that they represented different durations or styles of delivery (called **modes**) and had content associated with one of three key **themes**; curriculum innovation, subject pedagogy or leadership. There was also the requirement that courses should be provided across the network, not just at one centre. Table 1 shows the modes and themes of courses evaluated. The numbers of detailed case studies of practice in schools are shown in parenthesis in the relevant cells.

Table 1. Summary of the courses studied

Course mode	*Curriculum*	*Pedagogy*	*Leadership*
[A] Single day	4 (4)	2 (2)	-
[B] 2/3 day	1 (2)		-
[C] Sequences of multi contact	1 (2)	3 (6)	3 (6)
[D] Bespoke CPD	2	4	3

Number of courses (and cases) studied in each theme

There were two phases of the research. The first phase took place between July 2009 and February 2010 and was concerned with eight cases studied from four courses (Modes A-C). The second phase took place between July 2010 and January 2011 and involved collection of survey and case study data from a total of twenty courses. In this phase, data were collected from an on-line survey sent to 1800 teachers participating in courses (in Modes A-D) and through detailed case studies (for courses in Modes A and C) carried out in 14 schools, bringing the total number of cases (schools) studied in both phases to 22. It was not possible to carry out detailed case studies in schools taking bespoke courses (mode D), although questions used at interview had capacity to collect information on the planning and experiences of such courses.

A team involving lead researchers at the University where the study took place collected data in the first phase. To extend data collection across all regions of England, in the second phase, the team was expanded by recruiting Centre Evaluation Leaders (CELs), one based at each SLC. CELs were trained by experienced lead researchers from the University using a programme designed to ensure consistency and reliability in data collection and analysis. The training process is described in our full report of the second phase of the research (Bennett et al., 2011).

The on-line survey questionnaire consisted of twenty closed questions with single or multiple options and open comment boxes. Items focused not only on the selection process of the CPD course and the perceived impact of the CPD experience across Guskey's levels, but also on reasons and available evidence supporting these views. The sample population consisted of all participants in a selection of CPD courses stratified for the four CPD modes (A-D, shown in Table 1) and three content themes (Pedagogy, Curriculum and Leadership). A total of twenty courses (in Modes A-D) were included in this part of the study. Over a period of six weeks, 156 responses were received, six of which had no clear indication of a course code, and thus

could not be classified for mode or theme. The remaining 150 responses formed the basis of the analysis. The responses were analysed using simple statistical methods of frequency and percentage comparison between modes and themes, thus identifying patterns of differences. The reliability of the interpretation of the analysis was safeguarded since two researchers independently viewed the findings, and the responses for several items were discussed at research workshops involving CEL researchers.

Case studies involved face-to-face interviews with teachers from two different schools attending each course. In secondary schools the intention was to also interview a Head of Department or subject and one other senior manager, usually the person managing and monitoring CPD activity for the whole school. In primary schools the intention was to interview the Headteacher as well as the teacher participating in a course. Interviews were recorded and transcribed and the text of each interview was allocated line numbers. In some cases it was also possible to collect documentary evidence of teachers' action plans connected with courses and any training materials or lesson plans that had been produced as a direct result of CPD experiences and outcomes. Researchers from the central research team and CELs analysed text and extracted examples of responses according to a set of themes that emerged from scrutiny of responses in an early part of the study.

FINDINGS

The nature and extent of teachers' professional changes resulting from CPD

All course modes and themes had similar capacity to challenge the ways in which teachers teach (that is, at Guskey level 2). On-line survey results showed this was true for 2 in every 3 teachers, though only 1 in 6 said they were challenged very much, except for courses involving multi-contacts (Mode C), where this was closer to a quarter of teachers. Leadership courses provided much more challenge than ones focussed on curriculum or pedagogy, where nearly all (94%) felt teaching was challenged a lot or to some extent. Case studies revealed that impact on one's own practice was universal, even where teachers were highly experienced or already had significant management and training roles. Examples of changes were often subtle, sometimes peripheral to a course's central intentions, or through casual 'osmosis' from practice experienced through CPD into one's own pedagogy. For example, an experienced teacher and Head of Department commenting on a course, focussed on leadership of change, said this:

> *"... if you go along to inset* [CPD] *session and you see someone delivering something and ... doing it confidently, you can take that into your classroom teaching ... that sort of style, and you always pick up these things* (even when the course is about management and leadership). *All of this adds to your kind of. . .repertoire"*

Data in Table 2 below show that two out of three teachers reported, in the survey, that the CPD had affected their teaching in some lessons or even most lessons (53% and 11%, respectively). The proportion of teachers reporting such change was considerably higher for multi-contact courses (a total of 84%) and for leadership courses (85%). However, change in teaching was less than average for those involved in single day courses and curriculum courses.

There was a strong desire shown by most teachers to share outcomes of their CPD. Hardly any (3%) of the respondents in the survey saw themselves and their pupils as the only beneficiaries. Almost half (47%) of respondents reported that their whole department or Key Stage (age phase) team benefitted from their CPD, whereas one in three (32%) teachers reckoned that only one or two colleagues benefitted. In addition, one in six teachers reckoned that the CPD had a positive impact on their whole school, teachers in other schools and students teachers. These trends were supported by case study data. Strong actions to change whole school approaches or policies were particularly common in primary schools. It seemed primary teachers attended courses with intention to obtain specific skills, knowledge and expertise that would be rapidly disseminated to colleagues and so influence or change school policies. For example, a course on Gifted and Talented

Table 2: Teachers' reported changes in their classroom teaching (n=150)

Change in classroom teaching	Mode (%)				Theme (%)			All (%) n=150
	A n=52	B n=8	C n=60	D n=30	Ped n = 27	Curr n = 61	Lead n = 62	
Most of my lessons	8% (4)	13% (1)	12% (7)	17% (5)	11% (3)	7% (4)	16% (10)	11% (17)
Some of my lessons	37% (19)	88% (7)	72% (43)	37% (11)	56% (15)	36% (22)	69% (43)	53% (80)
A few of my lessons	37% (19)	0% (0)	7% (4)	30% (9)	22% (6)	39% (24)	3% (2)	21% (32)
Not really changed the way I teach	19% (10)	0% (0)	10% (6)	17% (5)	11% (3)	18% (11)	11% (7)	14% (21)

pupils clarified what the term 'Gifted and Talented' implied and resulted in a radically changed school policy on learning provision for these pupils. Changes in practice often have to be proven to be successful at a personal level before a teacher feels able to communicate and recommend them to others. This was particularly so for teachers in primary schools. One primary teacher said this:

> *That's usually what I'd do from a course, I try things out. I think most people are the same. There's certain things you can pass on that are general to the school. When it comes to ideas, you're better having tried it yourself and if it works then... on a training day I can show them* (colleagues) *some of the activities when I feel a bit more confident using them and that they work.*

In some cases actions were far reaching and sustained over a period of months following CPD. These actions typically included any of the following: preparing sets of training materials, surveying teachers' lesson plans, making changes to long, medium and short term plans for teaching, training technicians, purchasing additional equipment and books, adapting or changing policies, liaison meetings with teachers in other schools and special activity days for pupils from nearby schools.

When it came to providing actual, 'hard' evidence of change in teaching or effects on pupils' learning, teachers and their managers often found it difficult to provide more than anecdotes or vague impressions of what might have occurred or been achieved. In the survey, more than half (50-57%) of respondents indicated they were uncertain of impact. Where teachers did cite evidence for change, over half referred to own observations in their lessons (56%) and to general improvements in the quality of pupils' homework or classroom tasks (52%). Only one in four respondents referred to more objective evidence, such as lesson observations by colleagues (28%), pupil questionnaires (26%) or test results (20%). It was notable that changes due to courses intending to improve pedagogy and curriculum were, generally, less well evidenced probably because leadership courses have more built in opportunities requiring reporting evidence of impact to course peers

Part of this reluctance or inability to warrant changes could be because managers in schools found it hard to distinguish impact of CPD from impact more generally. For example, in the case of a course for new Heads of Department over one academic year, it was hard to distinguish specific impact of the CPD from impact that had accrued from the teacher's personal development through having to manage other professionals. His Deputy Headteacher said this:

> "I can't . . . if I'm honest, say whether I genuinely think the course has made any difference to him whatsoever because it's so difficult to extrapolate that from what was happening to him over that year anyway. . ."

Schools' implementation space'. Factors facilitating or hindering classroom impact of selected CPD programmes

In analysing case study data, the team at the University coined the phrase 'school's implementation space' for CPD. This describes ways in which the human and physical resources in a school are brought together to plan, manage and implement CPD and its outcomes. Thus it describes the management systems organised to identify individual, departmental and whole school needs for CPD and ways in which outcomes are facilitated, for example through dissemination events, provision of equipment or other support for teachers to collaborate, reflect on and plan for development or change. Implementation space is also occupied (or at

least it should be) by processes to collect and analyse evidence of CPD impact. Where this takes place it could be through observations of lessons, monitoring of teachers' and departments' action plans, pupil work monitoring, surveys of pupils' voice and collection of pupil performance and other data.

Case studies showed that successful implementation of CPD outcomes, both at a personal level and especially in dissemination to colleagues or to bring about policy change, relied on harmonisation of CPD with department or school drivers for development. In one or two cases there were strong examples of deep rooted changes, backed by the sorts of corroborating evidence that were rare in many schools. In one case in particular, which we named the 'dream ticket for CPD' there seemed to be a number of features in the school's implementation space that were particularly important:

> The time was 'right' – a newly appointed Head of Department (HoD) seeking a willing ally (the teacher participant in the course) to implement change.
> The right 'central alliance' –the course participant was seen by school managers as an 'alpha teacher' working with a willing, though less experienced, middle manager (the HoD).

The right 'relaxed conditions', allowing the alliance of participant and HoD to occupy and function in the CPD implementation space – helped by school managers who 'backed off', allowing developments to occur without their interventions or constant critiques.

The right course type – a course on effective science demonstrations that was seen to be in sympathy with improving science by making it more exciting and appealing to pupils, thereby raising their levels of interest in and attitudes to science.

Previous contact with NNSLCs' courses. The teacher participant and her HoD had both previously attended a course at the NSLC and had been impressed by the quality of provision, tutor delivery and materials.

Analysis of case study data revealed hindering factors in schools' implementation spaces included: lack of provision to share and develop new approaches from CPD, absence of resources to invest in equipment or materials seen on courses, organisational arrangements of schools such as split site/short lunchtimes and the resistance of some teachers to adopt changes suggested by CPD. In one notable case, it was partly a failure in the lines of communication that conspired against impact. This case involved two teachers from the same school who had attended a single day course on 'Effective and Safe Demonstrations in Science' and who were determined to hold a series of sessions for their colleagues back at school so that examples of demonstrations could be shared. Unfortunately the placing of these two teachers on the course had been made by a senior manager without the knowledge of the Head of Department and so Departmental meeting time had already been allocated to address other activities and issues, meaning these teachers were unable to share their professional learning and their aspirations were frustrated.

The impact of different modes of CPD delivery

The mode (length) of a course strongly influences schools' choices for CPD. Choice is influenced by a complex set of interacting factors; cost, location, duration, likely disruption to teaching, disruption to personal lives and the personal expectations of teachers and their managers. In the survey, 56% cited disruption to teaching as the most influential factor in choosing CPD mode. Case studies revealed this was particularly sensitive where examination classes might be affected. One senior manager in charge of CPD for a school said this:

> *"I think people are very reluctant to say that they want to do them* (courses) *because they are just worried, you know... all the students that we teach are examined... You've got your lower years which you can maybe leave but, for us, time is so tight that people are very reluctant to leave their classes for more than one lesson, which is what it would be to go on any course."*

The survey showed choice is influenced by self–identified factors related most to the teacher (97% claimed needs are self identified). However, approximately 3 in 4 teachers still acknowledged the influence of managers. This links with evidence from case studies where interviewees in secondary schools described a CPD policy based on a 'bottom-up' approach to CPD whereby teachers are required first to self-assess CPD needs and these are then moderated by overarching requirements of departments or schools to bring about macro-changes in teaching or the curriculum.

One in three selected a course on the quality of the learning experience and here, personal or received knowledge of SLCs and the quality of what they provide is important as this quote from one of the interviews shows:

> *Well, we have had a lot of positive experiences with local Science Learning Centres ... I was aware of some of the resources coming out of them and at my last school, in Yorkshire, I went to the NSLC at York and it was great ...*

Multi-contact (Mode C) courses were often favoured on the basis of thoroughness of the learning experience. Thoroughness was also associated with bespoke CPD which has the added advantage of being less disruptive to teaching. While there were a number of advantages to Mode D (bespoke) courses including cost, immediate relevance, rapid dissemination and collegiate involvement, some teachers and their managers seemed to prefer an environment for CPD away from the busy and sometimes distracting routines and duties in a school. Half-day courses seemed hardly worth the cost and time for travel or setting of work compared with day courses. Twilight (after school) sessions are often seen as inappropriate and ineffective, due to levels of fatigue at the end of a day's teaching.

There are overlaps between themes that make it hard to associate the level of impact on individuals and their colleagues or at department or whole school level with the theme of a course (curriculum innovation, pedagogical change or leadership). For example, a course focussed primarily on curriculum innovation such as a new government initiative on teaching the history and philosophy of science could have just as much, if not more, potential impact on pedagogy because of the active promotion of certain ways of teaching, for example using group discussions of controversial science.

In case study interviews, the most commonly expressed advantages of multi-contact courses (Mode C) over other modes were that they provided cognitive space for deeper reflection on teaching and to test innovation and actions with wider impacts for teaching, such as assessment for learning. Gaps between days or blocks of CPD allowed deeper reflection on practice and for participants to clarify and debate effectiveness of changes in practice or policy with other teachers. Tasks set between blocks appeared to have facilitated and enhanced the extent of professional reflection. Course materials, procedures and techniques were most often used within weeks of the CPD event, much more so in Mode C and leadership courses (15% more than other themes).

As far as impact on pupils (at Guskey's level 5) was concerned, the survey findings showed improvements in pupils' science skills were most commonly reported even when courses had not had a specific focus on teaching practical science or on the history and philosophy of science. Improvements in pupils' general skills (such as 'thinking') were reported more often for Mode C (multi-contact) and Leadership courses, and less so for Mode D courses. An improvement in pupils' attitudes to science was relatively more frequent for Mode C and Pedagogy courses.

CONCLUSIONS

Combining the collection of quantitative survey data with qualitative case studies of enactment of CPD outcomes in schools provides fruitful material for analysis of impact. Survey information on CPD choice and expectations and outcomes, on its own, can provide a general picture of the processes and impact of CPD related to mode and theme of courses. However, school-based factors for CPD impact are highly situated and so case study research in schools is essential. The mode of delivery/duration of a CPD course cannot easily be separated from its theme. For example Leadership courses were almost always delivered through the multi-contact mode (Mode C). It has been possible to collect and analyse data across a wide variety of course types and school situations using a collaborative research model for multi-site research. This required extensive training and support for the personnel involved.

The mode of a course strongly influences schools' choices for CPD. Teachers and managers often found it hard to produce systematic evidence of impacts of CPD on teachers' professional learning and practice or on pupils' learning, attitudes or behaviour. Bearing this in mind there are still plenty of examples of claimed impact at all levels of Guskey's model including and beyond level 2. Challenge and changes to existing ways of teaching, likely dissemination to colleagues and impacts on pupils' performances, attitudes and behaviour were claimed for all modes and themes of CPD challenging findings of some previous studies (Darling Hammond et al., 2009; Penuel et al. 2007). However, it was still the case that these featured more for Mode C courses (multi contact/Leadership). Even where courses are clearly targeted at leadership, participants still show strong personal gains that change the ways they see their teaching.

SLCs have advantages of being able to provide high quality state-of-the-art training environments, experts in CPD content of courses, spaces allowing concentration away from the day-to-day life of school and the sharing of expertise between teachers from a wide variety of educational situations. These features were clearly valued by many who felt that CPD is more effective when teachers are able to think outside the

contexts and spaces of their busy professional lives. Nevertheless, a number of school-based factors including cost, location, lower risk of badly matched situational relevance and perceptions of deeper professional learning in a collegiate environment may persuade school managers and leaders to favour bespoke (Mode D) courses in the future.

In a time of limited financial resources, investment in CPD focused on multi-contacts and leadership seems particularly worthwhile to bring about the sorts of deep seated professional knowledge and change needed to improve science teaching quality along the lines desired by the nation. This is not to say that other modes of course delivery should be abandoned in favour of only funding these types of courses, as our studies show all modes have are valued by teachers and have impact. To embed changes at school level, however, will require systemic improvements in evidence collection and follow up to professional learning outcomes of CPD, whatever course type is followed.

Abstract: Inclusion of special students is gradually occurring in Brazilian public schools. Teachers main complaints refers on how to work reading and writing with special students. The objective of this study was to establish and evaluate a collaborative consultation program between researchers and regular school teachers on a methodology of collaborative action research, in a way that the researchers take part and make a process of change previously stated by the group. The study was realized in one regular public school and participants were 2 researchers, 8 regular teachers and 12 children with disabilities. Teachers had group meetings every week with researchers to evaluate and discuss actions and lectures every month about a chosen topic. Data was collected through teacher interviews, field diary, student progress recording, videotaping.. The results demonstrated that collaborative consultation has been proven to be an efficient support for teachers who have special children included in their classrooms.

Keywords: special education; inclusion; collaborative consultation.

INTRODUCTION

The inclusive education movement in Brazil had a great impact on the discussion of education policy for children and adolescents with special needs since the vast majority of this population had been historically excluded from the public education system in Brazil.

During the World Conference on Education for All in Jomtien, Thailand in 1990, Brazil has established basic goals to improve the Brazilian educational system. Among these goals, it seemed necessary to improve the education of children and adolescents with special needs. Later, in 1994 as a result of the World Conference on Special Needs Education: Access and Quality, organized by the Spanish Government and UNESCO in June 1994, the Salamanca Statement was approved. Theories and practices based on the principle of school inclusion began to be discussed with emphasis in Brasil.

Since then, the inclusion of students with special needs has gradually occurred brazilian in public primary schools (Brazil, 2006). In on one hand this insertion has been identified as positive (Mantoan, 2006), on the other, has generated conflict and distress to many teachers not knowing how to work with these students (Arsenic, 2007).

Once the public school system has demonstrated the desire for political change, the enrollment of children with special educational needs in ordinary classes began to increase and the horizon for research on school inclusion opened. Although there is no official data on this, it is known that one of the biggest complaints from teachers regarding inclusion of students with special needs, refers to the fact of not knowing how to work with certain content with students who are not literate; among these contents, the most problematic is the area of reading and writing - this area has been identified as the teacher most needs support. In this sense, collaborative consultation can constitute an important way to support teachers in specialized educational services to students with disabilities enrolled in regular education, since this service has the function to identify, develop and organize learning resources and accessibility eliminating the specific barriers to pupils, aiming their full participation in activities.

The collaborative consultation is a form of mutual work between the teacher education policy and a specialized professional counseling to discuss problems, find solutions to problems related to school inclusion (Palches, 2009).

Thus, this study aimed to show the development and evaluation of a collaborative consultation program between the project coordinator sponsored by FAPESP (Notice: Public Education Announcement), teacher /

researcher and resource room teachers in regular schools in meeting the specialized educational services in reading and writing for children and adolescents with different special educational needs – intellectual disabilities, learning difficulties and visual impairments. This project arose due to a concrete need for a public school and research involving the subject studied (Almeida, 2005; Almeida & Alpino, 2006, 2008; Almeida et al., 2007, 2008; Almeida & Rocha, 2008).

To develop this intervention research, the reference was research on collaborative consultation, which is defined by some authors as "an interactive process that enables groups of people with diverse experiences to generate creative solutions to mutually defined problems" (Idol, Nevin & Paolucci -Whitcomb, 2000, p.1).

For Kampwirth (2003), collaborative consultation is a process in which a consultant trained in the school works equitably, in a non-hierarchical relationship with other members in order to make decisions together and make plans aimed at improving the student who needs intervention.

Unlike other forms of consultation, collaborative consultation aims to work in conditions of equality among all members, adding experiences, searching for solutions, planning and evaluating together. Thus, it is essential to mutual respect, dialogue, non-use of jargon, the desire to learn with others and willingness to give and receive suggestions (Palches, 2009).

To have this partnership and in order to accomplish a successful collaborative work, it is necessary to establish some steps or stages. In this regard, Idol, Nevin, and Paolucci-Whitcomb (2000) established six stages in the process of collaborative consultation: 1) Create bond and establish team goals - is to create a bond with the first team work, goal setting, roles and scoring goals and benefits of collaborative work; 2) Identifying the Problem - there is a team effort to define clearly and precisely what is the problem that needs to be solved, 3) Interventions / Recommendations - the team discusses possible solutions and alternatives for action and plan how application will happen; 4) Implementation of the recommendations - the strategies and interventions are implemented to solve the problem, 5) Evaluation - outcomes of intervention are evaluated in terms of successes and points that need to be reviewed, 6) Continuation - the team evaluates their collaborative partnership work, celebrating the successes achieved by restructuring the job, making sure that the advice should continue, and formulating new goals.

The collaborative consultation generally involves the consultant, staff and students, this relationship, however, may extend to family, community and other people / professionals.

This type of consultation aims to find solutions both short term and long term, avoiding the emergence of other problems. This is the opinion of Jordan (1996) who believes collaborative consultation as a tool to promote the practice in the classroom, including three goals: to solve an immediate problem related to the learning situation punctuated by a colleague or team; help the colleague or team to develop knowledge and skills to enable them to deal with similar problems in the future and change the way people work, that is, their views and beliefs with respect to the person with special educational needs. The collaborative consultation permits, thereby not only solve current problems but prevent future problems and enable the teacher / staff to deal with them later.

Besides these benefits, the literature has pointed out other benefits of collaborative consultation. For Kampwirth (2003) this consultation allows, among other things, an approximation of labor between regular and special teacher; the support given to teachers who deal with the difficulties of the student; generating ideas through a joint effort ; the improvement of services offered to the student. In addition, the collaborative consultation also allows the team to get the field in the contents worked, interpersonal communication, the ability to solve problems, intrapersonal attitudes (Idol; Nevin & Paolucci-Whitcomb, 2000).

Some studies have offered contributions in this direction. Mishna and Muskat (2004) conducted an intervention project for people with learning difficulties, offering advice to parents and education professionals; the realization of this project showed improvements in performance of these students and provided greater understanding to parents and school staff on dealing with people with learning difficulties. Allen and Blackston (2003), undertook a study of training for teachers involving collaborative problem solving. The results indicated a greater adherence of teacher planning conducted jointly positive results in student behavior and the acquisition of problem-solving skills.

In Alpino's research (2008) a collaborative consultation program was carried out involving a physical therapist and teachers of students with cerebral palsy, and the results showed significant gains: the training of teachers; adaptations to the physical space / school furniture, the use of assistive technologies, activities and materials.

The literature presents some studies (cited by Idol, Nevin & Paolucci-Whitcomb, 2000) where the collaborative consultation is used as an important form of support for people with different disabilities, in varied educational needs and different levels of education.

In Brazil, there are not too many publications in this topic (Almeida et al., 2007; Almeida et al., 2008; Almeida & Alpino, 2006, 2008; Almeida & Rocha, 2008; Alpino, 2008; Jesus, 2007; Mendes, Toyoda & Bisaccione, 2007), despite some pioneering initiatives, and therefore required more research, covering the Brazilian reality. Besides being very few publications on collaborative consultation as well, according to Capellini and Mendes (2009), there are not, in Brazil, legislation and curriculum that gives support to a collaborative work.

Are even more scarce publications relating to collaborative consultation aimed at specialized educational services in reading and writing problems, where this intervention is indispensable to use strategies that facilitate the acquisition. ..

Thus, the work of collaborative consultation is to find strategies that address different modalities to solve or mitigate the problem of reading and writing, thus causing improvements in the school, being this, the objective of this research.

METHOD

The investigation is based on the methodology of collaborative action research, which is one among the many existing forms of action research used recently. In this mode, the function of the researcher is "to take part and make scientific a process of change previously started by the group" (Franco, 2005, p. 485).

Giovanni (1998) points to projects that address the collaborative action research between school and university, can generate innovative practices both within schools and the university.

Participantes

The participants were a team of eight teachers (two men and six women) from elementary school and a resource room teacher from a metro school system from a city in the interior of Sao Paulo. All teachers were over 10 years of teaching experience and were working in different grades in elementary school. Four of them had undergraduate degree in education, two with superior normal school, two had degree in Portuguese Language and one had a course of literacy. The teacher who also served as researcher, besides being a resource room teacher, has PhD. in Education. All teachers had students with disabilities placed in their classrooms.

Local

The survey was conducted in a Municipal Elementary School Education (EMEF) located on the outskirts of a midsize city in São Paulo State.

The intervention sessions took place in the classroom of each teacher as well as some interventions were performed in the computer lab at school, through the use of educational software and other computer resources. The team meetings occurred in the school resource room.

Materials

It was used the following materials and equipment: a notebook, digital camera, camcorder, a computer, printer, software and educational bond paper (for assistance in the computer lab and to make material for teachers and students) as well as electronic projector with the projection screen.

Data collection procedures and analysis

The data were collected through video and recordings and also it was used the following instruments: "Teacher interviews", "Diagnostic Evaluation ", "Planning Interventions Protocol", "Record Sheet - Daily Field. At the end of the research it was used: " Final interview with the teachers", "Record of Student Progress".

Table 2: Study design and timeline

Steps	Objectives Year: 2009	Data Collection / Data Analysis Procedure
1 - Ethical Procedures. (September / 2009)	Clarify the team and obtain approval for the research.	- Authorization request for school principal for the Municipal Secretary of Education and for students parents submission of the project to the research Ethics Committee of UFSCar.
2 - Planning the Pilot Study. September	Making a first approximation of the stages of collaborative consultation..	- Presentation of the project for the team and mini-course - Meeting with staff members and parents. - Information on daily field use. - Information on observation in the classroom
3 – Search for student reading and writing problems of (October / 2009)	To investigate the problems presented by students and possible strategies to solve them.	- Meeting with members of the team. - Discussion of data from the field diary. - Interview with Teachers: A guide for for Diagnostic Evaluation - Elaboration and implementation of instruments designed as a team to verify the reading and writing difficulties.
4 - Planning of interventions. (October/2009)	Planning in collaborative partnership, as will be made interventions and planning lessons.	- Meeting with members of the team - Discussion on the data of field notes. - Using the "Protocol Planning Interventions"
5 - Implementation of Pilot Study October and November/2009	Implement the planned interventions, and evaluation of what was not successful. Share the experience with the group.	- Meeting with team members - Discussion on the data of field notes. - Using the "Protocol Planning Interventions". - Guidelines for parents.
6 - Evaluation of collaborative consultation based on Pilot Study (December/2009)	Make a survey of collaborative consultation from what was experienced by all staff during the implementation of the Pilot Study, by gathering data relating to impressions of the team about the students studied in order to verify and discuss the results and strategies for 2010	- Meetings with team members - Use of a field diary Reflection and analysis of data from the Pilot Study
	Year: 2010	
7 - Action planning for 2010 based on the Pilot Study (January and February)	Make a survey of the problems presented by students and possible strategies to solve them.	Meeting with team members. - Discussion about the use of field notes. Reflection on the actions of 2009 and suggested actions for 2010 - Interview: "Diagnostic Evaluation" with teachers - Elaboration and implementation of instruments designed as a team to verify the reading and writing difficulties of students
7. application of planned strategies March to November	**1.Realize phonological awareness activities** (Activities: rimes, Music, Poetry, Cards syllables, spelling mistakes, sentence structures, forms of reading, spelling cards, tokens alphabetic) **2.Realize Learning Strategies** Story about learning strategies, preparation of posters, presentation on learning strategies, **3. Carry out strategies for promotion of Cognitive Development** **4. Perform necessary curricular adaptations**	- Meetings with team members - Data analysis of field notes. - Realization of Phonological Awareness Activities, learning strategies - strategies for promoting cognitive development, curricular adaptations - Filming the lessons - Photograph classes - Using data show - Use the "Protocol Planning Interventions" - Guidelines for parents.

Table 2: Study design and timeline (cont.)

Steps	Objectives Year: 2010	Data Collection / Data Analysis Procedure
8. Evaluation of collaborative consultation. December/2010)	Make a survey of collaborative consultation from what was experienced by all staff	Using the "Guide to final interview with the Teacher" and "Final Record of Student Progress"
		Data Analysis
9 - Analysis of the data. December / 2010	Gather data regarding to the impressions of the team, and students participants in order to verify and discuss the results.	- Gathering the collected the data in class / interventions (tapes, pictures), in the questionnaires, on the field notes and meetings with the team, about the strategies used and collaborative consultation. - Based on these data, formulate and cluster analysis categories, making a statistical analysis regarding the occurrence of them - Descriptive analysis of opinion / experience of teachers regarding the collaborative consultation. - Data collection and discussion of methodology used in the questionnaires

Research stages

Each intervention activity was planned in advance by the team, considering what was raised earlier about student difficulties. At each meeting, the various cases were discussed. Based on the observations of the team, interventions were conducted in classrooms by teachers. All this experience was shared with the team that assessed whether the intervention was successful or not, so this experience was added to other teachers. Importantly, the intervention was intended not only to students with special needs, but to everyone else.

Year: 2009

The first part of research began in August 2009 and lasted until December 2009, coinciding with the closure of the school year. At first moment of the work, the selected teachers were invited to attend meetings. It was made a general presentation of the project and initial interviews with all participating teachers ("Guideline to Initial Interview" and "Guideline for Diagnostic Interview) and they all signed the "Statement of Consent. "
The results of these questionnaires showed that, among various difficulties mentioned by the teachers, lack of training resource materials were considered most critical and that Portuguese is considered the most difficult subject to be taught. Based on these data, meetings with teachers were started.
At the beginning of the study (August/2009), teachers in each class applied for a diagnostic test to verify the level of reading and writing of their students. The purpose of these tests was to identify the degree of reading and writing not only for the target student, but for the entire room, considering that the interventions would be in everyday classroom and for all students. With this evidence a survey of learning difficulties of these students was done, although some points were raised by the team, that will be discussed later.
In those early meetings, there was little interaction, predominantly over the speech of the researchers. This type of preoccupation was noticed through the notes drawn in the teachers diary:

> *"At first I felt insecure about the realization of the project but gradually, the meetings were clearing my doubts"* (Teacher 4).
> *"During the first meetings I had mixed feelings. Curiosity and apprehension about the project: "How to perform?", "What's next, " "Will I cope?", "Can we achieve the goals?".* (Teacher 6)

Each teacher received a diary to make notes, in order to remind them about what was said at the meeting, guiding them and avoid potential interpersonal problems. The daily information was fixed in teachers diaries, such as: the definition of collaborative consultation roles in the project, characteristics of the collaborative team, guiding questions for the field notes).
Gradually, barriers that previously existed, i.e the passive attitude regarding the project were being broken. According to Gately and Gately (2001), the collaborative work involves three stages: 1. Early Stage - characterized by infrequent and formal conversations, but also a certain inhibition 2. Commitment stage - there's more enggement, more communication and experiences exchange; 3. Training Collaborative - the

interaction is can be loose, spontaneous and humor predominates. Therefore, the team seems to have passed an initial stage to a s commitment stage making it clear to teachers that they were chosen precisely to exchange their experiences and teaching knowledge.

All meetings took place weekly, on normal working hours on a schedule designed for school planning.

Regarding interventions, it was agreed with the team, that it would be worked on strategies to students from 1st to 3rd year, considering the difficulties of attention and memory of the students targeted by the survey such as: 1. syllabic families report to as a visual and auditory to read and write, 2. use mnemonic strategies to remember some letter ("the "e" from Elephant"), 3. remember the many uses of a letter / syllable, 4. Associate the sound of a word starting with the initial sound of another word - alliteration, 5. Associate the sound of words that end in the same way.

With the students from the 4th to 9th grade, strategies were worked on the basis of literature (Boruchovitch, 2007; Coast Rivers, 2005; da Silva & de Sá, 1997): 1. Learn to summarize (orally and in writing later), 2. Find keywords in the text, 3. Underline important words and phrases 4. Use resources to store (schemas, graphs, charts, drawings), 5. Have a notebook with these resources (socialization with the room), 6. Use dictionaries and the Internet to seek information 7. Acquire the habit of reviewing what was learned; 8. Working understanding of the text orally and then in writing 9. Division of text into parts, using illustrations.

For all students, from the early years until the final years of elementary school were also worked attitudinal strategies based on literature (Costa & Boruchovitch, 2004; da Silva & de Sá, 1997): 1. To know how to remove objects or situations which cause distraction in the environment 2. Reduce anxiety in reading and writing, 3. Make it a habit to review what was done 4. Not being afraid of making mistakes; 5. Do not be afraid to ask 6. To believe you can achieve 7. Difficulties persist in 8. Cope with challenges; 9. To learn to concentrate, to think and plan; 10.To review / check what was done 11. Learn to motivate yourself 12. Learn how to identify difficulties and facilities

During the meetings, the teachers planned intervention activities, and were instructed how to record the field diaries, which was shared with team members. During the meetings, the teachers began to share more and exchange materials and activities. In this sense, were made available two folders - one for activities in the early grades and one for the other series - in which the team could leave them copies of activities and materials for the group.

The "Protocol for Intervention Planning " was also used and in this type of protocol each teacher had very clear what would be his/her intervention and would have more elements to share the results with the group. The use of videos and photos, helped to record the activities.

In one of the meetings, the group reached an important conclusion - that the students learning difficulties lies not only in reading and writing but in the use of cognitive abilities in general. This is based on the fact that these students participate in various activities in reading and writing, both in the classroom, as in the resource room and school support services, and even then, show little progress. Thus, it was noted that perhaps the way to achieve better performance with these students would be in addition to reading and writing activities that develop working memory, perception, deductive and inductive reasoning, mental imagery, problem solving, among others. In this sense, addressing to the Human Information Processing could easily contribute to it.

In the last meeting in December it a general evaluation of the project was discussed. It was raised the strengths and weaknesses of various instruments, interventions, diaries, collaborative work, as well as other issues were raised.

As for the instruments of data collection, there was total acceptance of the "Guide to Initial Interview, "the "Guide to Diagnostic Interview" and " Intervention Planning Protocol".

As for the evidence used to identify the problems of reading and writing, it was raised the following questions: teachers felt the need for a more complete evidence that would allow a better identification of the level of reading and writing of their students.

Teachers from lower grades felt that the test "Four words and a sentence " (Smith & Teberosky, 1986), not identified in more detail the level of the reading and writing, and the other teachers felt that the dictate "One afternoon in the field "(Sisto, 2007) only allowed to obtain a student's profile in the area of spelling, requiring instruments for evaluation in the areas of production and interpretation of texts. It was then proposed to draw up specific test for the early grades, including identification of vowels, consonants, and phonological awareness, and for the other series, one assessment containing three tests: dictation, reading comprehension and production. Thus, it would be possible to have a qualitative and quantitative assessment from the beginning to the end of the interventions.

Another issue raised was regarding the administration of videos and photos. Teachers proposed that both the videos and the photos were taken by themselves, in order to leave the environment as natural as possible. There was common agreement on this point.

At the end of 2009, it was possible to conclude, based on records in field diaries (the teacher researcher and the eight teachers) and in the "Follow-up Meeting Form" that there was progress in the stages of collaborative work, from an early stage (with little interaction) to a stage of commitment (Gately & Gately, 2001).

Year 2010

In February and March 2010 meetings were held with the parents of the target students in order to request authorization for the child's participation in the project. During the month of March, the Instrument Rating Repertory Basic Literacy - was applied to students in Year 1; also, a test developed by the school was applied for a student of 3rd year, and the dictate "One afternoon in the field" and other activities for other students were also applied.

From the application of these instruments and the "Diagnostic Interview", it was possible to identify the problems of reading and writing, and to confirm the target students to participate in the research.

Several interventions were planned in order to promote cognitive abilities such as attention, memory, perception, and motor skills and self-control (Gargiulo, 2006), Themes, such as phonological awareness, learning strategies, cognitive processes (memory, attention, solution problems, types of reasoning), were worked with teachers in planning interventions. For all these interventions, participants discussed the adaptation of curricula and ways to evaluate learning.

RESULTS

Through weekly meetings with staff and teachers' reports, it was noted that the collaborative consultation has allowed educators to further reflection on their practice as well as the ability to solve problems. The collaborative work has enabled the possibility for teachers to share problems and expectations, not only in relation to the student target, as other students in the room, which made them feel not alone in this process of school inclusion.

It is also important to note that performing this type of research involves many factors that made the work difficult, such as lack of parental involvement, high number of absences of some target students and, in one case, changing schools, internal conflicts at school; some teachers lack of motivation; the school structure, lack of teachers' time, within the requirements of the school to plan and implement interventions as well as difficult to understand, more fully, the fundamentals of these interventions. This is an important finding because it shows that the collaborative action research is done in practice at school, where they fit a large number of factors. Thus, performing this type of research requires that one can deal with tensions, resistances, as well as anxiety and teachers fears.

In addition, the collaborative consultation takes place over time, through the educational practice. As the literature pointed out, there is a whole process of breaking resistance until there is a period in fact collaborative. All this is possible to see in this project as the teachers' statements described below:

> It's a new experience, learn different things and share with other colleagues, this partnership between university and school. So I started to feel more secure for this collaborative work. "(Prof. 1)
> "I would like to reiterate the importance of the Program on Collaborative Consultation that has contributed so that we could increase the positive results of our work." (Prof. 4).
> "The collaborative partnership project has emerged as an important tool to evaluate our work and improve our performance and students' (P8)
> "... having a moment and a team to discuss these issues and also to think of ways to overcome all difficulties and obstacles caused by the system is a major conquest" (P 8)
> "At first, things were very vague to me but now I realized that I learned a lot during the meetings observing the practice of my colleagues and listening to the suggestions of the Project Coordinator" (P8).
> "I must stress that the partnership of collaborative work, enriches our educational work and with that, change the teaching and learning, bringing a huge contribution in the acquisition of reading and writing" (P5).
> "To put in effect the collaborative consultation we were informed that during the meetings we should respect colleague's opinion, to reflect instead of arguing, to take the advantage to learn from each other, to give and take suggestions without trials, to give everyone the opportunity to speak, direct talks on issues relevant and that we are not here to compete "(P2)

The teachers' involvement with the Collaborative Consultation Process, has provided the students with special needs a real school inclusion and not just "their insertion" in the regular classroom, where students as

"so-called normal" are developing activities from the curriculum of their grade and the students with special needs are there in a "corner " of the classroom probably "painting a yellow duck" in a piece of paper, i.e.eveloping activities that have nothing to do with those developed with students considered "normal". This can be seen in some of the teachers' statements such as:

> *"I acted as mediator, monitoring and assisting the target student who did very well. This activity is performed in pairs or in small groups is important to learn from each other "....." The target student is already able to read some syllables and phrases. "(P 1)*
> *"In reviewing the progress of research, with the record of activity and daily observation of behavior, you can see that Fausta has shown a positive development "(P 3)*
> *"I put a list of words on the blackboard, divided between verbs and nouns and asked the class even the target student to formulate rules for the correct use of termination. " (P 6)*
> *"There was a notable advance on target student during this time. Early in the project the student wrote the words together and did not identify the text elements. In addition, he was more resistant to develop the proposed activities. Commenting about his activities book, he mentioned that his father praised him about his letter, organization and activities. "(P 6)*
> *"The target student produced three texts and when reviewing text, made the necessary corrections without support" (P 8)*
> *"In my case, the target student" Fausta "(fictitious name), was enrolled in the fourth grade and has intellectual disabilities. Confuses the vowel "O " with "U "... I realized that her socialization greatly improved. This has been observed by myself and the family ..... She was always ready to carry out the activities... Some of them she did with more independence, others with some help... (P 5)*
> *"As previously mentioned there have been several advances by the student, but he still needs to perform some actions, repeat some of some instruments " (P 7)*
> *"I tried several partnerships with the target student until I found one that paid off because he needed someone to stay all the time asking him if he had finished the activity. The student then became more participant copying some things from the blackboard, becoming more organized with his material showing he had performed the activities. "(P4)*
> *"Over the academic year my target student required several adjustments and have difficulties to get the assignments from the blackboard" (P2)*
> *"Throughout the conversations and activities, the target student began to be less resistant and began to face the challenges. Regard to issues out of the classroom he was always willing to help This attitude can be considered a great advance he has demonstrated during the project. "(P 7)*

It is possible to consider that for all students with disabilities participating in the project, were effected by the collaborative consultation what is extremely important, since, at the end of the school year of 2010 all were promoted to the next grade on merit, that means, all of them got the grades they needed to pass.

We conclude that the collaborative consultation, may actually assist the regular education teachers in specialized educational services to students with special needs included in regular education.

77 - Measurement of Professional Competence in the Domain of Economics of University Students in Economics and in Business and Economics Education – Comparison of the (Old) Diploma and the (New) Bachelor Degree

Manuel Förster[1] and Olga Zlatkin-Troitschanskaia[2], Roland Happ[3], and Christiane Kuhn[4], and Daja Preuße[5]

Joannes Gutenberg, University of Mainz
[1]manuel.forster@uni-mainz.de, [2]IsTroitschanskaia@uni-mainz.de

Abstract: The focus of the project ILLEV lies on modeling and measurement of the cognitive teaching professionalism dimension in a longitudinal design: professional and didactical competence in the domain of Economics. This article examines primarily whether diploma and bachelor students of Business Education and of Economics (as a comparison group) distinguish themselves in their content knowledge and thinking and by which factors those differences can be explained. For this purpose parts of the Wirtschaftskundlicher Bildungstest (WBT, a German equivalent of the Test of Economic Literacy (TEL)) amongst others are used to measure the content knowledge. On the basis of the first project survey (adjusted sample in t1 = 743 students) comparative analyses by means of the total scores of the WBT and an IRT based MIMIC model are calculated. First results show that bachelor and diploma students marginally differ from each other if other relevant personal und structural characteristics are kept constant. At the same time slight advantages in the content knowledgt appear for students of Business Education in comparison to students of Economics. Especially gender, German as mother tongue and length of study seem to be important predictors for content knowledge. Furthermore it can be established that the WBT has an adequate applicability and validity for measuring economical knowledge in the first phase of the bachelor and diploma courses.

Keywords: *professional competence, content knowledge, domain of economics, competence measurement, MIMIC-Model*

EXPERTISE IN ECONOMICS AMONG STUDENTS OF THE "DIPLOM" AND BA DEGREE COURSE WITH OR WITHOUT THE AMBITION TO BECOME TEACHERS – ASSESSMENT METHODS AND FIRST RESULTS

Aims and Research Questions of the Project
The crucial role of teacher professionalization in a knowledge society is undisputed. Although the professionalization of teachers has been a field a lot of research has been conducted on during the last decades (cf. Zlatkin-Troitschanskaia & Preuße, 2010) only few empirical results of the effects of academic teacher training – especially of the individual (theoretical and practical) training stages - on the development and scope of professionalism exist (cf. Zlatkin-Troitschanskaia, Beck, Sembill, Nickolaus & Mulder, 2009). These research goals become even more crucial regarding the Bologna reform, as neither the effects of the phase-out model ("Diplom", state exam) nor of the new BA/MA model have sufficiently been validated empirically.

The research project ILLEV (innovative teach-study-network in academic higher education, cf. www.wipaed.uni-mainz.de/illev/), funded by the BMBF makes use of the (historically) unique situation of an almost natural experiment in which the traditional degree courses and the new consecutive courses coexist. It compares the old and new study model in teacher training – with special emphasis on economics education – regarding their effects on the scope and development of teacher professionalism over the course of three years. The reference analyses allow empirically secured statements on the question whether the new consecutive BA/MA model contributes to a higher professionalism among future teachers. In this context professionalism is seen as a result of individual personal traits and structural factors of the degree course. The assessed structural factors can be divided into the following three levels: (1) the macro level of formal and organizational parameters (i.e. lecture times, spatial and personal environment), (2) the meso level with elements of the teach-study process development (i.e. e-learning, examination procedures) and (3) the micro level of factorially implemented curricular and didactical/methodical parameters.

The project focuses on modeling and measuring the cognitive dimensions of teacher professionalism that is on the subject-related and didactical competence in the field of economics. It is based on the definition of competence by Klieme and Leutner (2006) who described competence as a context specific performance disposition. This definition grants a high importance to subject specific knowledge when it comes to conceptualizing competence (for further definitions of competence cf. Baumert & Kunter, 2006; Bromme, 1997; Shulman, 1986, 1987; Weinert, 2001).

The central research questions of the ILLEV project concentrate (1) on the influence of the traditional and the new consecutive study models on the development and scope of teacher professionalism. For the project they were *modeled to the test* (IRT- and MIMIC-models) as professional competence and didactical competence and were assessed at three different points in time; (2) the identification and quantification of individual features (i.e. previous knowledge, motivation) and structural factors of the degree course that have predictor or mediator characteristics.

After displaying the research design of the ILLEV project (chapter 2) and the employed survey instruments (chapter 3) *this paper* will describe the main content and measuring results of the *first* survey on modeling and measurement of the degree of *professional competence in economics. It will be illustrated if and to what extend "Diplom" and BA students of economics education (students who aim for teacher training) and economics (students who do not aim for teacher training) differ in their professional knowledge and thinking and what factors can explain these differences*[1]*.

RESEARCH DESIGN

In order to assess the development of (cognitive) teacher professionalism dimensions (subject-specific and subject-didactical competence) among students of the new consecutive BA/MA model of economics education ("intervention group") during the course of time, *longitudinal surveys* were conducted at three dates: (1) before teaching practice ("theoretical phase"), (2) after teaching practice ("practical phase") and (3) after teaching practice and the tutoring of the probationary teacher training seminar ("reflection phase"). Hence the ILLEV project can answer the question to what extend the different learning institutes (university, school and probationary teacher training seminar) contribute to the development of the assessed dimensions of professionalism.

The survey takes into account main personal treats (age, job experience etc.) and structural factors that (can) influence the development of professionalism positively or negatively. For a systematic comparison of the traditional and new consecutive degree course economics education, students of the "Diplom" degree course are being surveyed (control group) at the three test dates with the same survey instruments. The *comparison group design* allows for research statements on whether and to what extend one of the two study models actually contributes to higher teacher professionalism.

Apart from the professionalism dimension of subject-didactical competence, subject-specific competence is one of the main focuses of the project. In Order to validate the implemented test instruments and the constructed measuring models a further comparison group is added to the survey: BA and "Diplom" students of economics. The economic contents are the same during basic studies ("Diplom") and the orientation and consolidation phase (BA) of both economics education and economics, so that a further systematic comparison can be conducted. This enables among others statements on whether the development of professional competence among students of economics education is identical to the development among students of economics or if it is influenced by other structural or personal factors.

Employed Instruments

The questionnaire of the first survey (October 2009) contained - apart from the economics education test (WBT) - sub-scales of the intelligence-structure test (IST, analogies and numeric tasks, Liepmann, Beauducel, Brocke & Amthauer, 2007; Amthauer, 1970), scales on the attitude towards economic circumstances (employment questionnaires on economic questions, EWF, Beck, 1993), on the study interest or choice of degree course (inter alia items from the questionnaire on study interest FSI, Schiefele, Krapp, Wild & Winteler, 1993) and questions on socio-demographic data.

The dimensions of economic knowledge and thinking were assessed with the help of the economic education test (WBT). The WBT assesses economic knowledge and thinking and is the German version by Beck and Krumm of the English Test of Economic Literacy (TEL, Beck, 1993; Beck, Krumm & Dubs, 1998). Soper and Wallstad (1987) developed the TEL which permits a differentiation between relatively low and relatively high development levels of economic knowledge and thinking. The translated test was adopted in a number

---

[1] Due to shortage of space this paper will not deal with the underlying theory model and hypothesis system. Cf. therefor Förster et al. (in the making).

of German-speaking countries, facilitating an international comparison (Lüdecke-Plümer & Sczesny, 1998). According to the classical test theory the measuring features and quality factors of the WBT have been researched and validated for the English and German version (Beck & Krumm, 1990; Beck, Krumm & Dubs, 2001; Soper & Brenneke, 1981; Soper & Walstad, 1987). Thus the WBT is an adequate tool to assess economical thinking and knowledge.

Beck, Krumm and Dubs (2001) recommend the use of the WBT especially for business and academic commercial training. The WBT was created for target groups with an economic knowledge one stage below university level, even if some questions reach university level. The project ILLEV amongst others assesses to what extend the test can be used for measuring competencies in higher education or if it is too easy for university students. Attention is paid especially to the occurrence of possible ceiling effects and selectivity indices of the items. The curricular validity of the test is being reviewed as it was designed according to high school and college curricula. The project investigates if and to what extend the test reflects the content of economics university studies (here: BA and "Diplom").

The WBT consists of two parallel versions with 46 items each; 15 tie items allow for a comparison of the two versions. The deployed questions can be divided into the four economic sub-domains "Basics of economics", "international relations", "microeconomics" and "macroeconomics". The questions were also theoretically arranged according to the cognitive levels by Bloom[2] (Beck, 1993; Soper, 1979).

The survey used a version of the WBT that contains 33 multiple choice items with one correct answer out of four options. The original version was thus cut back by 13 items, as the processing time had to be reduced out of organizational and motivational reasons. In order to guarantee the curricular validity of the test, not only the curricula were analyzed, but lecturers of the relevant classes were also being surveyed. They had to assess the different items of the WBT according to their curricular relevance (and difficulty).[3] The domain "international relations" was erased due to curricular reasons (eight questions). It is no substantial part of the BA and "Diplom" basic studies in economic science (or business studies and economics) at the University of Mainz. The items used in the survey which cover the three other domains highly correspond to the curriculum. Two further items with complex graphics in the survey were left out as they were not practical. The other three questions were left out because of their theoretical allocation to Bloom's taxonomy and the item-specific results (Beck, 1993).[4]

The second survey (November 2009) included the "Business Administration Knowledge Test" (Bakt, Bothe, Wilhelm & Beck, 2005) that was curricularly validated as a further instrument. Together with the WBT it was used to assess economic expertise. The BAKT, which was also to be implemented during the third survey in November 2010, although it was created for university level focuses on declarative expertise. So before implementing this test as part of the project, it has to be secured that the BAKT masters the requirements for measuring expertise as an essential part of professional subject-related knowledge in higher education (i.e. assessing declarative, procedural and conative knowledge dimensions).

Sample, Analysis of Representativeness and Weighting
The first survey was part of the longitudinal project during the winter semester 2008/2009. The students were surveyed during main classes.[5] The processing time was 75 minutes; project assistants controlled the questions and presented the survey to the subjects. In total 901 students of economics and economics education were surveyed, 743 were analyzed after the content and subject-relation had been checked.[6] 44.5% male and 55.5% female students (three missing values) were surveyed; 84% had German as their mother tongue (two missing answers). About one fifth of the test persons completed a vocational training before their university studies. The average school leaving grade was 2.34 with a standard deviation of 0.56 (61 missing values).

---

[2] Bloom's cognitive taxonomy divides study goals or requirements to solve tasks into six consecutive categories of increasing complexity (Bloom, 1971).
[3] The survey was conducted online.
[4] The complete processing time was 75 minutes. The surveys were conducted during class, so that 75 minutes were not to be exceeded in order to guarantee an orderly test implementation within the 90 minutes of class. The better part of the test focuses on assessing cognitive ability dimensions, so that the processing time, which calls for a high concentration among subjects, is already very long. Hence the WBT had to be shortened.
[5] The classes were selected so that as many BA and "Diplom" students as possible studying in different semesters could be surveyed without assessing students twice in different classes. Therefore classes were selected with mostly different students.
[6] For example only students with economic science (business studies and economics) and economics education as their major were included in the sample.

The representative analysis revealed some differences between the sample and the main unit regarding the distribution of certain features.[7] For example, students of the "Diplom" degree are underrepresented in the sample (cf. chart 1).

Table 1: Quota of degree courses of the main unit, the unweighted and weighted sample

		Quota of the main unit	Quota of the unweighted sample	Quota of the weighted sample
Degree course	Diplom business studies	29.34%	16.99%	30.37%
	Diplom economics	12.72%	5.75%	10.44%
	Diplom economics education	10.88%	13.01%	11.74%
	BA economics education	6.23%	10.00%	6.45%
	BA economics studies	40.82%	54.25%	41.00%
total		100.00%	100.00%	100.00%

For that reason the sample cases were weighted to align the distribution of known parameters with the main unit. Different matching processes (classification tree method, propensity scores, distance weighting; cf. Rässler, 2002) matched the subjects from the sample with test persons from the main unit. The weighting reflected how many people from the main unit matched the subjects from the sample. The matching processes were supported by bootstrapping analyses in order to stabilize the estimation parameters. Reviews tried to find out to what extend the weighted sample approximates the individual distribution and the structural coherence of the variables within the main unit. The best approach was gained by the weighting that averaged the classification tree and distance weighting. One of the main results of the analysis shows that even the unweighted sample is a good approach towards a structural coherence of the main unit, while the basic allocation of variables in the main unit is only assessed moderately. Hence all analyses are being conducted with weighted and unweighted samples. Different analysis results can be an indicator for sample effects.

COMPARING ANALYSES ON PROFESSIONALISM BASED ON THE WBT SUM SCORES
The distribution of the sum score added up to an average (MW) of 20.91 correct answers to 33 items and a standard deviation of 4.77. The distribution's skewness is -.383, the kurtosis is -.122 (cf. chart 1). It is obvious that only a small number of students gave correct answers to all 33 questions. Most students can clearly improve. The results show that the test is not too easy and there are no obvious ceiling effects.
Chart 1: Distribution of the WBT's Sum Score within the Sample

At first a simple t-Test and a Mann-Whitney-U test were conducted to compare the average of the BA and "Diplom" group. In the unweighted sample the "Diplom" students reached an average of 22.09 correct

---

[7] Comparing the samples with the main unit is possible due to anonymous data for the criteria gender, degree course, age, university and course semester, school leaving grade and federal state in which the school leaving certificate was gained.

answers, the BA students only reached an average of 20.28. The differences were even bigger in the weighted sample, where the "Diplom" students gave correct answers to 21.96 questions, while BA students did only to 19.52. For both samples the differences between the two sample groups in the t- and Mann-Whitney-U test were significant (p=.00).

The average scored by students of economics education (prospective teachers) is slightly higher than by students of economics (no teaching ambitions). The students of economics education ("Diplom") score an average of 22.64 while the economics students ("Diplom") score 21.77. Furthermore, economics education students (BA) in average solve 21.41 answers correctly while economics students (BA) only solve 20.06. One gets significant differences in the results when comparing the economics students with the economics education students with the help of a simple t-test or a Mann-Whitney-U test. Students of economics education (BA) score a p-value of 0.016 in the t-test and thus show a significantly higher score than students of economics (BA). The comparison of students of economics education ("Diplom") and economics ("Diplom") shows a p-value of 0.093 in the t-test, thus the difference in average between the two groups cannot be regarded as significant.

The "Diplom" students usually are in a higher semester and have visited more economics classes, so for that reason other relevant influences (i.e. duration of studies, number and character of attended classes) have to be assessed for an objective comparison. Therefor a linear regression was conducted that included further declarative variables to the model (chart 2).

Table 2: Weighted and unweighted regression on the sum score of the WBT (beta coefficient and level of significance)

WBT (included)				
R = 0.548 **R = 0.574**	**R² = 0.300** **R² = 0.330**	**Korr R² = 0.292** **Korr R² = 0.321**	**Unweighted** **Weighted**	
	coefficient (unweighted)		coefficient (weighted)	
	B	Significance	B	Significance
(absolute term)	20.62	0.00	21.37	0.00
BA	0.55	0.30	-0.31	0.59
Female	-1.65	0.00	-1.63	0.00
Other language	-1.89	0.00	-1.12	0.00
semester	0.79	0.00	0.56	0.00
No job training	-1.31	0.00	-1.32	0.00
Analogy score	0.30	0.00	0.30	0.00
Mathematics score	0.27	0.00	0.32	0.00
School leaving grade	-0.90	0.00	-0.25	0.04

The regression analysis shows: The variance of economic knowledge and thinking can by 30% (weighted 33%) be explained by the variables study model, gender, mother tongue (German or others), number of semesters, a completed vocational training, the school leaving grade and the intelligence sub-scales analogies and numeric tasks. As the beta coefficient of the BA degree course is not significant when controlling the other variables, a systematic study model effect cannot be assumed. The male subjects on average solve 1.5 more tasks than the female subjects. The following surveys will especially concentrate on the question if this can be drawn back to question or answering format effects (cf. i.e. Spiel, Schober & Litzenberger, 2008). A good school leaving grade, high marks in the intelligence tests (analogies and numeric tasks), a completed vocational training and German as mother tongue also lead to higher test results in economic knowledge and thinking. As expected the number of years studied at university level also influences the results, because with every semester an average of .56 (weighted) and .79 (unweighted) more items can be solved correctly. The estimations of the beta coefficient of most cause variables do not differ greatly between the weighted and unweighted sample. The results of the two samples only differ regarding the independent variables BA students (.55 vs. -.31), other mother tongues (-1.89 vs. -1.12) and school leaving grade (-.90 vs. -.25).

The sum score was implemented as it was assumed that all used items assess economic knowledge and thinking to the same extend. Hence every item has the same selectivity and the individual items only differ regarding their difficulty. The basic underlying measuring model is a simple dichotomous Rasch model (1PL model). However, this assumption is very restrictive. Therefore it will be checked if a 2PL model (Birnbaum

model) can explain the data more accurately (cf. i.e. Hambleton & Swaminathan, 1990; Hartig, 2009).[8] If the 2PL model provides a clearly better adjustment, the next step would be to calculate a MIMIC model based on this alternative measuring model in order to identify the influence of different factors on expertise as well as possible item functions (cf. chapter 6).

Comparing Different Measuring Models and Adjustment of a MIMIC Model

Global Fit Indices are needed to compare the data adjustment of the 1PL and 2PL model. This is possible through transforming the gained IRT parameters into a confirmatory factor model (Finch, 2005; Muthén, Kao & Burstein, 1991). The two alternative designs of the measuring model facilitate a broader and more flexible use of the data (Glockner-Rist & Hoitjink, 2003). The great advantage of connecting the two approaches is that measuring models can be analyzed, modified and globally assessed based on the plausible, statistic model by the IRT. Chart 3 provides an overview of the IRT-modeling results and the FIT indices.

Table 3: Quality factors of the 1- and 2PL model with 33 or 30 items

Model	Model I	Model II	Model III	Model IV	Model V
WLSMV estimator	33 items, 1PL	33 items, 2PL	30 items, 1PL	30 items, 2PL	30 items, 2PL, 3 residual corr.
Chi²	664.529	550.720	406.221	377.467	349.389
Df	221	242	202	221	220
p-value	0.000	0.000	0.000	0.000	0.000
RMSEA	0.052	0.041	0.037	0.031	0.028
CFI	0.704	0.794	0.841	0.879	0.900
TLI	0.725	0.825	0.852	0.897	0.914
WRMR	1.666	1.307	1.356	1.121	1.076

Analyses show that the 2PL model reaches the highest fit among the models with 33 items (models I and II). This is confirmed by the adjusted Chi²-Quadratic-Difference-Test. Based on the item fit of the 2PL model three items are eliminated. Two of them show a too low, non-significant selectivity. One item's residual has too high a correlation with other residuals. The 2PL model also shows a better fit for all criteria, including the Chi²-Quadratic-Difference-Test (models III and IV), among the models with 30 items. It is obvious that the 2PL models shows a RMSEA of .031 and thus stays under the critical limit of .05. The model-specific covariance matrix of the 1PL model fairly approaches the data's covariance matrix (RMSEA = 0.037). In the following the more suitable 2PL model is being used to assess economical knowledge and thinking. Model V allows three residual correlations and thereby further improves the fit.

Due to the 2PL measuring model not all items are weighted equally for the score of the latent construct "economic knowledge and thinking", but will be weighted according to their power (or rather discrimininant). As a next step, a MIMIC model (Multiple-Indicator-Multiple-Cause -Model) is adjusted to this measuring model (cf. Finch, 2005; Muthén, 1989). The MIMIC model integrates apparent covariants that can be recovered to latent variables as well as apparent items (operationalizations). Apart from the study model (BA vs. "Diplom"), gender, mother tongue[9], school leaving grade, year of studies and previous vocational training are included in the analysis of economic knowledge and thinking.[10] It is thus to assess if different groups of surveyed students differ in their latent knowledge score and if different factors influence the score significantly. The MIMIC model further investigates if measuring invariants in the form of differential item functionings[11] (DIFs) occur (Finch, 2005; Gallo, Anthony & Muthén, 1994; MacIntosh & Hashim, 2003; Woods, 2009). This is the case if covariants still greatly affect the individual items under supervision of the latent knowledge score.

The designed MIMIC model for the *unweighted* sample shows a better fit than the simple (2PL) model. The RMSEA is .026, the CFI is .926, the WRMR is 1.027 and the Chi²/df – Ratio is 1.51 (Chi² = 390, df = 259, p

---

[8] The 3PL model was not used as it calls for 1000 subjects per item to guarantee a precise estimation of the parameters of the 3PL model according to Eggen (2008).
[9] The mother tongue was binarily coded into German mother tongue" and „other mother tongues".
[10] The selection of influential factors was based on the results of a previously conducted multiple-linear regression with dummy variables.
[11] Differential item function (DIF) means the situation in which two different groups show significantly varying answer patterns for the same item, although the underlying latent variable is constant (cf. Holland and Wainer (1993), Zumbo (2007) for more information on DIFs). Blömeke et al. (2009) show an example of DIFs in their study MT21, where the difficulties of individual subject-related, mathematical knowledge items with different cohorts and identical average latent score vary. Evidence shows that 4 items with an identical average knowledge score are clearly more difficult for first year students than for graduate students. The opposite effect applies to 7 items. The research group was able to attribute the DIFs to different effects (i.e. oblivion processes).

= .00). The underlying latent variable shows an average of -.141 and a standard deviation of.277. The following chart shows the relevant coefficients.

Table 4: Regression results of the MIMIC model (unweighted sample)

Unweighted R² = 0,30	Absolute B	Significance	Effect size[12] Cohen's d	DIFs
Female	-0.221	0.000	0.800	0
Other language	-0.240	0.000	0.866	1
School leaving grade	-0.083	0.003		0
Year of studies	0.108	0.001		8
No previous vocational training training	-0.100	0.002	0.361	0
BA	0.042	0.351	0.152	0

The analysis shows that all covariants apart from the study model greatly influence economic knowledge and thinking. All in all, the included variables account for 30% variance in economic knowledge and thinking. The "gender" factor (Cohen's d = .800) has an especially high influence. Male subjects score higher by .221. German native speakers also have a great advantage (d = .866). Students who completed a vocational training before score .100 points more, while students with a low school leaving grade achieve .108 points less per grade. Per studied year the latent WBT value increases in average by .108 points. Eight differential item effects can be identified that can be explained by the different years of study. 7 DIFs favor students of higher semesters while only one item effect leads to better results in the latent score of students of lower semesters.

A study model effect cannot be verified when controlling the described influences. In total, BA students reach a higher latent score by .042 in the sample, however, this difference is non-significant (p = .351). The effect between the two study models shows a Cohen's d of .152 and is therefore very low.

Similar results were gained from analyzing the *weighted* sample. The model fit turns out even better: RMSEA = .022, CFI = .922, WRMR = .927, Chi²/df – Ratio = 1,362 (Chi² = 124, df = 91, p = .013). The underlying latent variable now shows an average of 0,201 and a standard deviation of .335. All in all, 37.5% of the variant of economic knowledge and thinking can be explained this way (cf. chart 5).

Table 5: Regression results of the MIMIC model (weighted sample)

Weighted R² = 37,5%	Absolute B	Signifikance	Effect size Cohen's d	DIFs
Female	-0.312	0.000	0.931	0
Other language	-0.310	0.000	0.925	1
School leaving grade	-0.047	0.230		0
Year of studies	0.197	0.007		6
No previous vocational training	-0.052	0.285	0.155	0
BA	0.154	0.107	0.460	0

This model also confirms the strong influence of gender (d = .931) and mother tongue (d = .925). The year of studies gains influence while the school leaving grade and previous vocational training are no longer significant. In total, the relevance of the study model increases. BA students score .154 higher than Diplom students. Cohen's d of .460 implies a moderate effect. However, the p-value of.107 exceeds the critical significance level of.05, so that a systematic effect cannot safely be assumed. The weighted model shows 6 DIFs that can be led back to the duration of studies and one caused by the mother tongue.

CONCLUSION AND DISCUSSION
The regressions of the sum score of the WBT as well as the MIMIC models show that BA students have the same expertise as "Diplom" students. Both the weighted and unweighted models showed no significant effects of the two study models. There are also no DIFs in which the two groups of students differ.

---

[12] The forces of effect were only specified for dichotomous items to enable an evaluation of the effect among the respective groups.

The restructuring of decree courses at the University of Mainz began in 2007 and thus is still in its preliminary phase. It will be of high interest to see if the results will be repeated in the following longitudinal surveys and especially at the end of the BA course. Additionally, only economic expertise and thinking were compared. Further research has to be conducted on the question to what extend other competence dimensions get influenced by the study models. The second and third survey will assess the difference in development of the students of both study models and what types of development can be identified within the degree courses. When comparing the degree courses economics education and economics, the students of economics education scored higher. This effect only becomes significant among the BA students while there is no systematic difference among the "Diplom" students. The following surveys of the project will evaluate if the good results of the students of economics education (prospective teachers) can be confirmed and what the reasons might be.

When looking at considerable cause variables on the development of economic competence, all models confirm a high explanatory potential to gender and mother tongue. Similar results were gained in own performance tests and other German and international studies on general/specific knowledge (i.e. Walstad & Robson, 1997; Lüdecke-Plümer & Sczesny, 1998). This result is especially significant because of the increasing relevance of performance surveys in higher education and the increasing number of admission tests due to the change in course models (especially for MA courses). The reasons for better test results among male subjects will be scrutinized in the course of the project. It will be assessed amongst others, if the BAKT shows comparable gender-specific differences from the WBT. Other influences than gender differences, like the question/answer format and the use of study strategies will be assessed.

As suspected, German natives have an advantage in the WBT. The test consists of full, grammatically complex sentences and thus goes along with a need for certain language skills. There is also evidence which indicates that a vocational training and good school leaving certificate positively influence economic knowledge and thinking (cf. Beck & Wuttke 2004). Vocational training obviously teaches test relevant contents. The grade of the school leaving certificate could indicate ambition, study strategies and general test performance which are also good predictors for knowledge and university performance. However, the influence of the school leaving grade and job training is not (any longer) significant in the weighted MIMIC model. The upcoming surveys will check if there is an automatic influence. Further models include other latent variables (i.e. dimensions of intelligence, motivational and attitude features) as factors that explain economical competence.

Our analyses further show that the results of the weighted and unweighted samples do not differ significantly. In some cases, especially in the case of the MIMIC models, there are small differences in the results. These differences can be first indicators for potential sample effects in the first survey. Whether these differences will be visible in further samples and the eventually necessary weightings in the second and third survey will be scrutinized.

Regarding measuring methods it can be stated that the 2PL model of the WBT approximates the collected data significantly better than the simple (1PL) Rasch model. Based on the RMSEA however the 1PL model already accounts for a good approximation of the model-specific and data-specific covariance matrix. Nonetheless the 2PL model shows a superior adjustment of Fit indices and the Chi²-Difference-tests. The 2PL model reveals two items that could not clearly be separated.

With reference to the opening question to what extend this test is applicable to competence assessment in higher education, the WBT can largely be implemented as a measuring invariance. Ceiling effects have not been found and there are no signs of the test being too simple for university students.

Gender- and study model-specific DIFs could not be identified. Only one DIF was found that is caused by the factor "mother tongue". The items with DIF effects caused by varying durations of study were answered correctly with a higher probability by students in higher semesters with the same latent score - with one exception- than students in lower semesters. The MIMIC model here shows which answers depend strongly on the duration of study and thus on the curriculum of economics studies. The survey among lecturers at the University of Mainz also shows that the contents of the items are anchored in the university curriculum. Based on the thus far gained project results, the WBT can be seen as a tool sufficiently applicable and valid for measuring economic knowledge during the *first phase* of the BA and "Diplom" degree course.

During the further course of the project it will be assessed to what extend the WBT can be used to show individual developments regarding the expertise of students. Comparing the results of the first and second survey will provide further clues. During the next survey the BAKT (Business Administration Knowledge Test, Bothe, Wilhelm & Beck, 2005) will be assessed regarding its psychometric suitability for measuring economic competence. The performances of the students of different study models and degree courses can be compared again (lateral and longitudinal). It will be of great interest if and to what extend the two testing

methods WBT and BAKT illustrate one or different, easily definable dimensions of subject-specific knowledge. Additionally, the self-developed test for measuring subject-specific competence in economics will be validated as part of the following survey. It will be interesting to see how much the subject-didactical and subject-related dimentions correlate.

82 - Developing the Pedagogical Sharing in the Preservice Teacher Education

Henriqueta Costa[1] and Isolina Oliveira[2]

Laboratório de Educação a Distância (LEaD), Universidade Aberta
[1]henriquetascosta@gmail.com, [2] isolina@univ-ab.pt

Abstract: Development instructional supervision encourages sustained reflection on practice and creates rich opportunities for personal and professional growth.

This research intended to understand the pedagogical sharing and the reflective practice that happens in the teachers' internship year and how it is related to the actions conducted by the cooperating teacher.

The results show that some cooperative teachers had an attitude mainly collaborative, others were mostly directive and forced their ideas on the future teachers and others accepted all the future teachers opinions with no discussion and let them on their own most of the time. Regarding the pedagogical practices shared within the groups, some student teachers shared tests and other teaching materials but also ideas, and opinions. Other groups of student teachers just worked together to prepare their extra-curricular activities.

To sum up, we argue about the importance of supervision for student teachers and the need for training of cooperating teachers.

Keywords: pedagogical sharing; preservice teacher education; professional development; reflective practice

INTRODUCTION

One of the most important steps in the student teachers' professional development is the preservice year in which he is able to develop a pedagogical practice with students under the supervision of a university's supervisor and a cooperative teacher.

The cooperative teacher is the high school teacher responsible for the classes to which the preservice teachers teach. Therefore he may be seen as a bridge between the student teacher and the school and he usually develops a very close relationship with the preservice teachers he works with. The preservice teacher's professional development is very much intertwined with the development of the preservice school year and the practices he experiences throughout that year may facilitate his adjustment to the school environment in the future.

The changes in school and the reality of the global world are challenges that the teachers must face nowadays. To face them, he has to accept his own experiences and make the best of them, learning as much as he can from his own life. In order to do so, the student teacher must be receptive to reflect on his actions and on his own reflections and to learn more about himself in order to change his own behaviour and improve his pedagogical practice.

It is common knowledge, at least within schools, that teachers still work very much isolated. The collaborative work is not yet a common practice in Portuguese schools and too much is lost in the lack of trust between colleague teachers. Authors as Stenhouse (1975), Shön (1987) and Alarcão (1996) defend the importance of collaborative work in the development of the reflective teacher. In the preservice year, future teachers are grouped with colleagues, so it becomes a lot easier to work as a group, collaboratively, since some of the activities are conducted by the group. The development of collaborative work throughout that year may promote the development of collaborative work with other colleagues in future years. On the other hand, if the preservice teachers isolate themselves that year it is very possible they will continue doing so in an environment where isolation proliferates.

In our study we accompanied thirteen groups of preservice teachers and their cooperative teachers. There were five groups of mathematics future teachers, two of physics and chemistry, five of informatics and three of physical education. We developed a qualitative search conducting interviews, observing meetings, administering questionnaires and organising a field diary to collect information that would lead us to characterize the cooperative teachers, characterize the pedagogical practices developed within each group and try to establish a relation between the characteristics of the cooperative teacher and the pedagogical practices developed by his group of preservice teachers.

In this paper we will present the general theoretical framework in which our study was based that was funded in the reflexive supervision model and the development of collaborative work in school community. Then,

we will present the methodology we followed and, finally, the data analysis. There are, naturally, some considerations to present.

THEORETICAL FRAMEWORK

The final decades of the twentieth century brought severe changes in the school environment. School was no longer the only space where children learned and new demands were made to teachers. As an answer to these demands, new paradigms emerged and teacher's education turned in new directions. Teachers' education focused less on quantity and more on quality since it became essential for teachers to acknowledge that their knowledge was not the ultimate truth and to become receptive to what their own students brought to school. Teachers must understand that their task, nowadays is much more than transmitting information to the students, it is mostly to enable them to search knowledge, reflect on the world and create bridges between daily life and knowledge.

Supervision is, according to Alarcão and Tavares (2007), "a process in which a teacher, with more experience and knowledge guides another teacher or candidate to teaching through his human and professional development" (p. 14). As a process, it combines different stages and happens during a period of time, a school year. This process consists of moments of observation and discussion combined with formative and summative evaluation.

The preservice teacher education is the first phase in teachers' careers where they live early field experiences. In the final year of their graduate studies, student teachers used to have an internship in a school developing supervised pedagogical practice under the supervision of a university's supervisor and a cooperating high school teacher. For this school year of supervised practice, the university organises groups of two to four preservice teachers of the same disciplinary groups. Each group is placed in a high school and the preservice teachers are, sometimes, given each a class of pupils or they teach the cooperative teachers' classes. The supervision conducted by both the cooperative teacher and the university's supervisor happens in a cycle in which the supervisors observe the future teacher's practice, meet to discuss it, and then observe again as many times as necessary. The intervention of the university's supervisor is usually rarer since he only observes a few of the preservice teachers' classes and discusses them. This process culminates in the evaluation of the preservice teacher.

Teaching the cooperative teacher's classes or not, the preservice teachers have regular contact with the cooperative teacher since he attends to most of their classes and meets them on regular basis, once or twice a week. The cooperating teacher, being the one that works closer to the future teachers, has to be able to develop with them a relationship of trust that allows the preservice teachers to trust and support on the cooperating teacher.

The cooperative teacher, being a supervisor, should have some important characteristics that promote the trustful relationship with the preservice teachers but also reflect confidence. Some of the most important characteristics are *flexibility* that allows him to accept the different approaches used by the preservice teacher in their classes; a *multi-perspectival view* that helps him to understand the supervisee and even the students point of view; *the capacity to manage and control anxiety* that, inevitably will appear throughout the relationship with the preservice teacher; *openness to learning* because new situations and the perspective of the student teachers might contribute to his own professional development; *be able to handle power* without dismissing from his responsibilities nor force his own ideas on others; *humour, humility and patience (Hawkins & Shohet, 2006).*

According to Glickman (1985, quoted by Alarcão & Tavares, 1997), there are 3 types of cooperating teacher: the *non-directive* – the one that is fully opened to the future teacher's ideas and wishes and lets him organise his own practice at will – *the collaborative* – the one that listens to the future teacher and presents him his own opinions and ideas promoting the debate and negotiation – and the *directive* – the one that is inflexible and forces his own ideas on the preservice teacher, seeing himself as a model that should be followed.

In recent years reflective supervision has become the most defended supervision model by many authors. The main characteristic of this model is the continuous questioning of the preservice teacher by the supervisor in order to promote reflection and the construction of knowledge by the preservice teacher. In this model, trust is built based on experiences and the preservice teacher and the supervisor decide together on the paths to choose. Negotiation is the key word.

Several authors, such as Dewey (1933), Schön (1987) or Zeichner (1993) recognise the importance of reflection in the development of the teachers' pedagogical practice. According to Dewey, reflection does not consist of a series of procedures to be used, it is specialized way of thinking.

Schön (1987) has written widely about reflective practice and proposes three types of reflection. The reflection in the action is the one conducted by the professional when the situation is happening and it allows

him to choose the right path. This reflection is based on the prior teacher's personal and professional experience. The reflection on the action happens after the situation and transports the teacher back to the situation allowing him to decide on a different path next time a similar situation occurs. In this reflection the teacher tries to understand the reasons for his choices. Finally, the reflection on the reflection in the action also transports the teacher to the action, exactly to the moment when the reflection in the action occurred. All these stages of reflection combined allow the teacher – or the preservice teacher – to separate himself from the situation and reflect on it conducting to changes in his pedagogical practice. However, for this development to occur it is essential that the teacher be opened to the reflection and the changes it might bring.

For the preservice teacher to develop the ability to question his own actions and judgments, analysing them and correcting in the future, it is important that the cooperating teacher act as a role model. Therefore, the cooperative teacher must also be able to reflect on his supervising actions, questioning them and correcting. Ribeiro in Alarcão (2001) refers that "the reflective attitudes of the supervisor will influence the development of similar attitudes on the preservice teachers" (p. 94).

No supervision model is entirely appropriate to every situation and every preservice group and no model is fully applied by the cooperative teachers. The integrated models commonly applied vary because of the theoretical structure of the final university's school year (that is also the preservice year), of the orientations provided by the university's department to which the student is connected and the characteristics of both preservice teachers and cooperative teachers.

Different preservice teachers have different characteristics and are often in different stages of their own development which will restrict the cooperative teacher's actions. A preservice teacher that is in the early stages of his professional development is very motivated but also very insecure about his own abilities, therefore, he will need the cooperative teacher's support. On a second stage, the preservice teacher becomes very defensive and it is necessary to try and break barriers and promote his reflection. On the other hand, when the preservice teacher is more confident on his abilities his own relationship with the cooperative teacher becomes more equal allowing free discussions of encouragement between them and promoting reflection (Thompson & Moffett, 2009). The professional development of the preservice teacher reflects on the relationship he establishes with the cooperative teacher.

Van Mannen (1977) refers to different levels of reflection: a) the reflection is focused in characteristics and behaviours on his own past experiences; b) the teacher reflects upon his choices and what is best for his students; c) the self knowledge that the teacher detains allows him develop an ethic and moral concern and be autonomous. In order to reach this final stage the teacher has to break barriers of defence and distrust and develop the common practice of individual and group reflection.

It is common knowledge in schools that teachers work mostly alone. Sá-Chaves and Amaral in Alarcão (2000) assume this common teachers' isolation and justify it by "the fear of exposure" and, less commonly, by "a pride that is unnatural and unhealthy for himself and for those he works with and works for" (p.81). Teachers offer resistance to present their work and their practices to colleagues. To Stenhouse (1975), it is important for teachers to be available to observe and discuss on each other pedagogical practices. The first reaction to the sharing of the teachers own ideas, work and practice is usually defensive but it is important to promote a relationship filled with trust among the group of preservice teachers and their cooperating teacher that allows them to share their work and reflections on the situations they live and those that happen in their colleagues classrooms. The school institution and those who introduce teachers to this institution – cooperating teachers and others – need to promote the collaborative work among future teachers in order to change the current practices and end the teachers' isolation.

The preservice year is the first contact of the future teachers with school and the practices developed throughout this year become familiar to the preservice teacher. So, in the future years, it is expectable for him to share his pedagogical practices if he did so his first teaching year.

Nowadays, the complexity of the projects developed in education has, step by step, brought the teachers together. In order to implement a common innovation, to deal with a difficult class, to explore a new notion that, for example, is directly related to another discipline, teachers seek the possibility of developing collaborative relations with each other, as referred by Boavida (2002). This collaborative relationship has every chance of succeeding if it is voluntary and if the participants in the relation welcome this partnership and accepts all as equals.

Ponte and Boavida (2002) present the main advantages for the development of a collaborative investigation. The commitment of a group of people in a common objective conducts to the concentration of a considerable amount of energy and strengthens the determination; on the other hand, a group of people with different experiences and skills enriches the resources of a project and adds security in the promotion of changes;

finally, the interaction, dialogue and joint reflection of a group of people create synergies that enhance the reflections and the possibility for mutual learning. Therefore, collaborative work is important not only for the result of the activities developed by the group but it is also important for the professional development of those that are part of the group.

The collaborative work developed within the preservice teachers' groups consists in sharing prepared classroom materials. By sharing them, the preservice teachers allow their colleagues to comment on their work promoting their own reflection and, therefore, the necessary changes and professional development. Oliveira and Serrazina (2002) argue that it is important that the teachers be opened to letting their colleagues observe their work. This, along with the questioning of their own practice, the will and skills to study their own practice and the interest in testing theory in practice are the main characteristics of the teacher who is focused on improving the teaching-learning process in which he is involved.

The development of reflective teachers that can work as a community will promote reflexive schools with members that support each other, discuss with each other and search and create knowledge that will ultimately be the support of the school's autonomy.

There is no doubt that reflection promotes changes in practices, innovation, professional development and the improvement of the teaching and learning process. Collaborative work within a group of teachers that share a common project (a class or a discipline) will benefit the individual reflection through the group sharing of ideas and reflections. Therefore we can easily understand that collaborative work is also an important tool to achieve professional development and the improvement of the teaching and learning process.

METHODOLOGY

For this study that we developed in the school year of 2008/2009, we formulated three research questions:

How can we characterize the cooperative teachers participating in this study?

How can we characterize the pedagogical practice developed within each of the preservice teachers' group?

What is the impact of the cooperative teacher characteristics in the pedagogical practice develop by their preservice teachers?

We opted for a qualitative approach in the study in order to create new paths in the development of an inductive analysis (Lankshear & Knobel, 2004). Our main goal was to understand the dynamics of the participant groups and achieve results that gained meaning within their context. Therefore we divided the data collection in three different phases.

In the first phase we conducted semi-opened interviews with each of the teachers and each of the cooperative teachers. In these interviews we intended to collect data regarding the activities developed throughout the supervised school year, the expectations of each of them of the year ahead and the characteristics of the cooperative teacher. In these interviews, the teacher was welcomed to add any information they thought might be important.

After the interviews we observed meetings of the preservice teachers groups with and without the cooperative teacher. These observations were oriented by an observation grid that had three parts of closed answers regarding the dynamics of the meeting and the behaviour of both cooperative teachers and preservice teachers and one part of opened answers that allowed us to add any information that seemed important.

In the last few weeks of the supervised school year we applied our questionnaires. There were two different questionnaires, one for the cooperative teacher and one for the preservice teachers. We used some of the information we collected from the meetings to organise a group of questions regarding the preservice teachers' meetings with and without the cooperative teacher. The two other parts of the questionnaire included questions regarding the matters taught by the preservice teachers and the pedagogical sharing among the group of the future teachers and with the cooperative teacher.

The general data collected on the encounters and informal conversations with the teachers was organised in a field diary. In it we registered some conversations with both cooperative teacher and preservice teachers that took place in an informal environment. We also registered some situations that occurred as well as the investigators view on those situations.

Table 1: Data collecting instruments

	1st phase	2nd phase	3rd phase
Instruments	Conducting Interviews	Meetings' observation	Applying questionnaires
Date	October to December 2008	January to March 2009	March and April 2009
Data	Preservice year organisation and cooperative teachers' characteristics	Cooperative teachers' characteristics and pedagogical sharing within the group	Pedagogical sharing within the group

After collecting all the data we triangulated it – crossing data from different sources and collected at different times – and triangulated methods by combining different instruments to collect information on the same matter.

In the development of our study, we worked with 13 groups of preservice teachers and their cooperative teachers from different initial formations, such as mathematics, physics and chemistry, physical education and informatics. Forty eight teachers participated in our study, thirteen cooperating teachers and thirty five preservice teachers from a total of six different high schools in Madeira Island.

DATA ANALYSIS

The analysis and interpretation of the collected and codified data was developed in three stages. In the first stage, we focused our attention in the general data trying to identify situations common to all the groups, general characteristics of the cooperative teacher and of the pedagogical practices shared within the groups. In the second stage, we analysed the data regarding each different disciplinary group, the similarities within each group and differences from the other groups. Finally, in the third stage, we focused on each different group of preservice teachers and their own characteristics.

From the information collected in the interviews with both cooperative teachers and preservice teachers, we were able to verify the diversity in the organization of the preservice year by different disciplinary groups or cooperative teachers.

Regarding the general characteristics of all the groups, we came across some interesting data. Although all of the preservice teachers were being prepared to teach secondary students, five groups did not teach secondary. Four of these groups taught the third cycle (7th, 8th and 9th grades) and one group taught second cycle (5th and 6th grades) which, according to legislation 1097/2005, does not prepare them to teach higher grades.
Figure 1: Levels taught by the preservice teachers of each group

Analysing each disciplinary group separately we find some resemblances among different school's groups of the same disciplinary group.

In the physics and chemistry groups there were no written indications to the cooperative teachers and the supervisor from the university limited his work with the preservice teachers to the evaluation observations. On the other hand, the physical education disciplinary group had a series of documents elaborated through the years by cooperative teachers and university's supervisors to indicate the tasks the preservice teachers

should do and how these tasks should be evaluated by the cooperative teacher. However, the preservice teachers of this disciplinary group taught a great variety of levels. The analysis of the table above might lead to wrong conclusions regarding the informatics disciplinary group. Although all the informatics preservice teachers taught the same levels, not all of them taught the same disciplines or even the same number of disciplines. Some groups taught three disciplines and two different levels while others only taught two. As we noted through the interviews, most preservice teachers felt some kind of injustice because of these differences. Some of the preservice teachers felt there were over-working compared with their colleagues from other schools and some felt they did not spend enough time with the students, teaching.

Through the interviews and the observations, we identified some of the cooperative teachers' practices that led us to their characteristics. We noted that some of the cooperative teachers let their preservice teachers lead their practices with no intervention from the cooperative teacher. These cooperative teachers did not attend all of the preservice teachers' classes and did not review the preparation of those classes acting, when necessary, after the class was taught. Using Stenhouse's words, they were mainly nondirective.

Other cooperative teachers worked along with the preservice teachers discussing their choices but leaving them space to implement them. These cooperative teachers had very frequent meetings with their preservice teachers and did most of the work in group. They shared discoveries, materials and reflections. They gave their own opinions but welcomed the preservice teachers' opinions and discussed them all as a group of equals. By so, they were mainly collaborative.

But most of the cooperative teachers presented characteristics associated to the early notions of supervision in which the supervisor was seen as an example. They gave directions to the preservice teachers and expected them to follow. They were very strict with their deadlines and they wanted the preservice teachers to conduct their classes as a copy from the cooperative teacher's classes they attended to. Some of these cooperative teachers even intervened in the preservice teachers' classes if they considered the preservice teacher was not conducting them properly and needed help. These cooperative teachers were, therefore, mainly directive.

Four of the cooperative teachers that participated in our study presented collaborative characteristics, one was clearly collaborative and three others mainly collaborative. The other nine presented collaborative characteristics but also directive or non-directive characteristics.

The mathematics cooperative teachers were the least directive and most flexible regarding deadlines. These cooperative teachers worked very closely with the preservice teachers and usually gave them suggestions instead of forcing their own ideas on them.

On the other hand, the informatics cooperative teachers were the most directive, taking charge in every situation and intervening during the preservice teachers classes. They were very strict regarding deadlines and the scientific preparation of the preservice teachers and they intervened in the preservice teachers' class if they understood it was needed.

The physical education cooperative teachers had frequent individual contact with the preservice teachers and had as a major concern the integration of the preservice teacher in the school dynamics but some of these cooperative teachers did not attend all of the preservice teachers' classes and did not even check their class preparation before the class was taught. The most non-directive cooperative teachers were physical education teachers.
Figure 2: Characteristics of the cooperative teacher of each disciplinary group

The observation of the meetings allowed us to collect important data on the pedagogical sharing within the preservice teachers' groups. These data were then used to organise the questionnaire in order to obtain more information on these pedagogical practices. We collected some other general information in the meetings' observation such as the fact that, in some groups, not all of the preservice teachers attended the group meetings on regular basis.

Using the questionnaires, we collected information both on the sharing of classroom materials and preparing activities and on the sharing of reflections. In this last part, some of the questions had the purpose of understanding the cooperative teacher's and the preservice teachers' opinions on pedagogical sharing.

In general, most of the student teachers prepared their classes and materials alone; developed the students' evaluation grids with the cooperative teacher and planned the extra-curricular activities with the other student teachers.

The informatics preservice teachers developed most of their work together and communicated several times a day to share materials with the colleagues and the cooperative teacher. This communication was not always physical but also virtual and every classroom material was previously inspected and "corrected" by the cooperative teacher.
Figure 3: How preservice teachers conducted their pedagogical practices

The preservice teachers' reflections on classes and students' evaluation were conducted mostly with the cooperative teacher but also alone, while the reflections on the group activities were developed mostly with the colleagues but also with the cooperative teacher. Some preservice teachers expressed they reflected both alone and with the colleagues and/or the cooperative teacher. Strangely, some preservice teachers referred not to reflect on their classes.
Figure 4: How preservice teachers conducted their reflections

The physics and chemistry preservice teachers worked mostly together within their group and reflected upon their pedagogical activities with the cooperative teacher.

Despite their cooperative teachers' effort, the physical education student teachers did not fit in the schools in which they were teaching and worked mostly in the university. Anyway, these preservice teachers worked and reflected mostly alone. We noted, when attending to the meetings that some of the physical education preservice teachers did not attend to every group meeting.

Final considerations and recommendations
In our study we identified collaborative, directive and non-directive cooperative teachers among the participating teachers. We also verified that some preservice teacher preferred to develop their classroom materials and reflections alone while others chose to develop them with their trainee group colleagues and others with the cooperative teacher. It is important for student teachers to develop the capacity to reflect on the classroom events and on the classroom materials produced. Preservice teachers should feel confident enough to organise their work and develop their reflections on their own but should also be encouraged to work in group, with their colleagues, on a collaborative environment that can end the isolation of teachers in the schools.

The preservice teachers that worked with collaborative cooperative teachers prepared their classroom materials and developed their reflections both with the colleagues and the cooperative teacher but also individually. The preservice teachers that worked with directive cooperative teachers prepared their classroom materials and developed their reflections mostly in group with the colleagues and the cooperative teacher. The preservice teachers that worked with non-directive cooperative teachers prepared their classroom materials and developed their reflections individually.

In our study we realized the immense influence the cooperative teacher and his actions have on the pedagogical practices developed by the student teachers. The cooperative teachers may promote or restrict the development autonomous and reflexive teachers. It is important for the cooperative to be aware of his influence and have the knowledge to develop the skills that will most benefit the student teachers he works with. Therefore it is clear that the cooperative teachers must have a special formation in teacher's supervision (Reiman & Thies-Sprinthall, 1998), which does not happen currently. The entire supervised practice should be well organised so that, no matter what is the school in which the preservice teacher has his supervised practice, every future teacher has similar activities to develop and teach the same number of classes and disciplines in order to minimize the feeling of injustice.

Abstract: In the decade 2000 to 2010 the higher education in distance mode got a rapid growth in Brazil, especially after the promulgation of the Law of Directives and Bases of National Education (Law No.9394/96). Most of these vacancies allocated the initial training of teachers to basic education. Due to this situation, this paper aims to analyze the effects that these courses have been leading to the personal and professional development of teacher-students who attended higher distance courses in Pedagogy and Normal courses at superior level. To develop the study, it was done a data collection of the postgraduate production on the subject in the last decade. The analysis made from the collected material showed that contributions were brought by the distance education courses, both in terms of personal and professional contexts. However, there was often the inadequate use of technological resources, which has caused damage to the offered training.

Keywords: teacher training, initial years of schooling, personal and professional development, distance education.

INTRODUCTION

The decades from 1980 to 2000 brought considerable changes to the educational systems in Latin America, mainly due to the new educational paradigms propagated by the central countries. Economic and social changes were some of the justifications brought by neoliberal upsurge that was set in that period.

In that context, it was attached a fundamental role to education in order to assist in overcoming the problems facing the world: social inequality, a large number of people not trained to the new demands of the labor market, which includes the use of new information and communication technologies (ICT) among other issues.

International meetings were held, such as the Jomtien, Thailand in 1990 in order to discuss the issues facing those imposed problems. From that meeting, it was created a guiding document of the following reforms entitled World Declaration on Education for All (*Declaração Mundial sobre Educação para Todos)* to enable the participating countries to assume commitments in relation to their educational systems.

Speeches made by international organisms came to a massive spread, presenting the needs and solutions for the issues related to education and training of teachers have emerged as one of the central issues to be considered.

Due to the emerging new educational paradigms and towards the pressure from international institutions in making the educational indicators reach higher levels, similar to central countries, numerous educational reforms were implemented in Latin America.

In Brazil, the Law of Directives and Bases of National Education - Law N.9394/96 (Brasil, 1996) was a landmark in the educational changes followed from the year 1990 on. Among the changes brought by the law, the superior level training of teachers of the early years of schooling appeared as one of the targets to be achieved in order to happen, as a direct consequence, the improvement of the education in

Picture 1: Evolution of the number of graduates – Graduate in distance mode by administrative body[13] - Brazil – 2002-2007[14]

the country. As Imbernón (1994) stresses, "it seems to have reached a consensus in all areas that people cannot mention education, innovation or change without considering the training of teachers"(p.36)[15]. To that end, the distance education was identified as an alternative. The offer of training courses in the distance modality for teachers has been seen by the State and groups of experts in the field of education as a viable and efficient way of providing the teacher training for a large mass of teachers in the shortest and possible time.

Through the necessity raised by the law, it began in the country a process of program implementations and post-secondary courses offered as distance modality by public and private universities. According to the data from the National Institute of Studies and Research Anísio Teixeira - INEP (*Instituto Nacional de Estudos e Pesquisas Anísio Teixeira)*, an agency linked to the Ministry of Education, in Brazil, about 50% of the enrollment in Pedagogy today are concentrated in the distance modality (Brasil, 2010).

Thus, the vacancies in this modality have grown substantially over the last decade. According to information provided by INEP (BrasiL, 2009), in mid-2008 the Brazilian higher education institutions relied on the sum of 222,446 enrollments in undergraduate courses in distance mode to teacher training to work with the early years of schooling. In more recent publication (Brasil, 2010), referring to 2009 data from the Brazilian higher education it was revealed the sum of 287,127 students enrolled in the Pedagogy course while 286,771 students were enrolled in Pedagogy course distance modality.

In this context, it is worthy to clarify that the Pedagogy course, a body which is now responsible for the initial training of teachers to the early years of schooling, is the course that has the highest percentage of enrollment among the undergraduate courses in distance modality, accounting for 34.2% of all students enrolled in this type of course in Brazil (Brasil, 2010).

Given the aforementioned context, this paper aimed to analyze the effects and impacts of training courses offered in distance modality to teachers of the early years of schooling on the professional and personal development of students-teachers. Such analysis was made from the academic production of postgraduate programs. The production's summaries of Brazilian post graduation courses are available in the database of theses and dissertations of CAPES, an agency of the Ministry of Education that is responsible for the accreditation and oversight of these programs. From the research made in the bank of theses and dissertations it was done a selection of productions that dealt with the subject and after that, the entire work was accessed on websites and libraries from the involved universities.

---

[13] The vertical column refers to the number of graduates. The first line represents the total; the second represents the federals, the third considers the states, the fourth the municipals and the fifth privates.
[14] Source: Higher Education Census 2007 - Results of the main variables.
[15] Translated by our own.

In this context, it was wondered: how a higher education offered in the distance modality with the use of technological resources and without the daily presence of a specialist teacher could contribute to personal and professional development of teachers who have already been teaching and future teachers?

This study reveals itself of a fundamental importance, considering the recent use of distance education in our country. In addition, thousands of teachers are being trained in this modality, which makes it essential to conduct research on the effects of this sort of graduate on Brazilian teachers.

This paper is organized into three sections. First, it discusses the expanded use of distance education modality through the country, especially in regard to its role in the process of superior level training of teachers teaching the early years of schooling. Following, it presents research's results of postgraduate on the issue on the matter of offering distance modality in courses and initial training programs and discusses the consequences of such training on the Brazilian education. Finally, the conclusions are drawn, and it indicates new possibilities and needs for the conduction of research on the subject.

HIGHER EDUCATION TRAINING OF TEACHERS OF THE EARLY YEARS OF SCHOOLING IN BRAZIL AND THE DISTANCE EDUCATION MODALITY

The problems related to schooling in the country, often evidenced in school routines and in external evaluations of the basic education, are the highlight themes divulgated by the media. The failure of the teaching-learning process is usually attributed to teachers who have the task of training citizens considering the demands of globalization. For this reason, the training of teachers has integrated on the agenda of the Brazilian government and it has been changing substantially. This paradigm is related to the context of an age that questions the effectiveness of education and, consequently, those who work in schools (Imbernón, 1994).

In Brazil, the graduate degree for the practice of teaching in kindergarten and in the early years of the elementary school was recommended in Law No. 9394/96, requiring the expansion of opportunities for jobs in teaching courses and the creation of courses that met the demand for teachers who work in educational institutions. In this context, policies to expand the courses to serve this population are thought, considering especially, the use of new technologies of information and communication technology (ICT).

The entry of distance education mode in higher education in Brazil is recent. In the last decade, after the legal opening provided by the Law of Directives and Bases of National Education - Law N.9394/96 (Brasil, 1996), the mode of distance education was intensified. In this law, the distance education found a legal space for its institutionalization. The 1990s marked the period of an effective beginning effective of distance education in higher education institutions in the country.

From 1995 it began to emerge some experiments aimed at training teachers motivated primarily by the induction of state governments. Regarding the offering of undergraduate courses in distance mode, the Federal University of Mato Grosso – UFMT *(Universidade Federal de Mato Grosso)* is considered one of the pioneers to start the course of Pedagogy's Degree, on a trial.

Other experiments have emerged mainly at undergraduate level for the training of already working teachers, in partnership with education departments of states and municipalities. The *Projeto Veredas*, for example, was the result of a partnership among universities, universities centers and other institutions of higher education with the Education Secretariat of Minas Gerais, offering jobs for teachers in the exercise of state and municipal schools. In 2000, the State University of Ponta Grossa - UEPG (*Universidade Estadual de Ponta Grossa)* started the Superior Normal Course with interactive media for the attention of municipalities of Paraná. This course was originated from a partnership between the Eletronic University of Brazil *(Universidade Eletrônica do Brasil)* and the State University of Ponta Grossa *(Universidade Estadual de Ponta Grossa)*, being offered to the working teachers in public schools. This technological model was adopted in 2001 by the Educational Department of the State of São Paulo - SEESP (*Secretaria de Educação do Estado de São Paulo)*, in partnership with the University of São Paulo – USP *(Universidade de São Paulo)*, Paulista State University – UNESP *(Universidade Estadual Paulista)* and Pontifical Catholic University of São Paulo – PUCSP *(Pontifícia Universidade Católica de São Paulo)*, providing a training program for teachers of the early years of schooling. The University of Brasília – UnB *(Universidade de Brasília)* also offered a pedagogy course in distance mode for teachers, in partnership with the Department of Education's Federal District (Kipnis, 2009).

As shown in Picture 1, it is clear that the distance education mode has entered in the Brazilian scenario comprising the government agenda and motivating the expansion of higher education. In this context, since 2005 the federal government implemented the Open University of Brazil *(Universidade aberta do Brasil-*

UAB) [16]. The Open University of Brazil was established by Decree 5800 of June 08th, 2006. It was created in partnership with the National Association of Directors of Federal Institutions of Higher Education and states enterprises under the State Board of Education with a focus on Policies and Management of Higher Education. It is a policy of coordination between the Department of Distance Education and the Directorate of Distance Education of the Ministry of Education, seeking the expansion of higher education under the Education Development Plan. Participate currently in the UAB System, the public universities and Federal Institutes of Education, Science and Technology. The adherence of governments and institutions of higher education to UAB occurs within the State Forums Permanent Support Teacher Training, created by Decree No. 6755 of 29 January 2009 establishing the National Policy on Education of Professionals of the Teaching of Basic Education and discipline the actions of CAPES in promoting the programs of initial and continuing trainings.

Thus, it is found that the distance education mode has turned to Brazilian government into an important ally raising the academic titration of its population, in a quickly and massive way, especially with regards to basic education teachers, a topic to be discussed next.

WHAT THE RESEARCH REVEAL ON TEACHER TRAINING IN DISTANCE MODALITY

In Brazil, the undergraduate courses in distance mode have been used primarily for training education teachers already working in public schools in the country and also for those wishing to enter into the career. The higher enrollment offered in distance mode focuses on the Pedagogy course (Brasil, 2010). Through such a scenario, the postgraduate programs of the country began their research about the functioning of these courses and perceptions arising from the course participants[17] and trainers who have participated in this type of education. From the analysis of the exposed situation, a question emerged: what research reveal about the contribution of the courses in distance mode to the personal and professional development of teachers already working and future teachers?

Regarding the aim of this paper, a survey was made on the data bank of theses and dissertations from CAPES, an agency attached to the Ministry of Education, in abstracts of papers produced on the subject. By these abstracts, there was a new selection of theses and dissertations that have been read and analyzed. The table below shows the total number of theses and dissertations analyzed and the year they were defended:

Tabela 1: Production of Brazilian Postgraduation 2000-2009

	YEAR OF PRODUCTION					
	2004	**2005**	**2006**	**2007**	**2008**	**2009**
Total per year	01	08	05	01	02	05
Grand total	22 PAPERS (05 THESES AND 17 DISSERTASSIONS)					

The courses examined in the theses and dissertations were mostly focused on the initial training of teachers who have already been working in public schools in the country and had an emergency feature, as they sought to meet an immediate and prompt demand, that is, to raise the titration of working teachers. Only two courses offered by private institutional education did not have this profile, as shown in the table below:

Tabela 2: Courses researched by the academic productions

According to the data provided, it was noticed that there are common elements among the courses in relation to the physical structure and human resources involved. Typically, the courses relied on decentralized units

---

[16] The information regarding Brazil Open University are available at: http://www.uab.capes.gov.br.

[17] Denomination given to students who attend such courses. It has the same meaning from other denominations found in the papers analyzed here and used, such as "student-teacher" or simply "student ".

called "poles" linked with universities through the World Wide Web. These poles, devices for transmitting images and data were installed. In the learning environment the course participants received a guidance from a tutor, an attendance agent as a mediator between students and the resources available (printed materials and computers, basically) and also organized the calendar of activities. The coordination of the courses is normally located at the headquarters of the university responsible.

Through videoconferencing and teleconferencing the course participants came into contact with the specialist teachers from different areas. In the poles, or in locations previously reported, it was carried out attendance tests which are mandatory by law. These tests as well as printed teaching materials and activities available in the learning platforms were designed and organized by the university professors. However, as we shall see below, even in present paper, not all technological resources could be used in the analyzed courses, which harm the original planning.

Right now, it is needed to clarify what is meant here by professional development. It is understood this phenomenon as an individual or collective process that must contextualize themselves in school and that contributes to the development of professional skills through different experiences, both formal and informal (Marcelo, 2009). Accordingly, Imbernon (1994, 1999) points out that thinking on professional development is refer to something that relates to change in professional life of teachers and not just to the new learning. Training is one of the parties that make up the professional development process.

One must consider that in many cases the professional knowledge of teaching is related to routines, habits, institutions and ideas that when learned and mastered they are applied mechanically. Encouraging the reconstruction of common pedagogical thinking requires a process of deconstruction of the patterns of thought and action and consolidated empirically and uncritically (Pérez-Gómez, 1999). The teacher considered alone is an easy victim of their deformities, weaknesses and interests, social and institutional pressures, which are still nourished by the inertia of the group, institutional and environmental pressure. The generality of investigations into the evolution of pedagogical thought of practicing teachers, their beliefs and attitudes, shows the inexorable tendency to the sclerosis of thought and action, to develop stereotypes increasingly resistant to the change that feeds themselves of the reproduction of an uncritically professional tradition (Pérez-Gómez, 1999; Barquín Ruiz, 1991).

Accordingly, in the sphere of the offering of such courses, it is expected that the working teacher can develop conditions to deal with the pedagogical knowledge that Imbernón (1994) calls as specialization, which is what differentiates and sets the teaching function and requires a concrete process of training that gathers specific characteristics such as complexity, accessibility and social utility that, in a given context, will enable the issue of situational judgments based on experiential knowledge, in theory and practice teaching. The specialized pedagogical knowledge legitimizes in the practice of the profession, and is united to the action. Therefore, some of that pedagogical knowledge is a practical knowledge from experience that generates information constantly and is processed in its daily work. Moreover, as emphasized by Marcelo (2009), besides these aspects, the professional development seeks to promote the growth of the professionals as people. Although the studies analyzed did not allow us the analysis of the legitimacy of this knowledge and these changes since they do not focus on the practices developed in the institutional work environment from teachers, they show the indicators relating to the possibility of developing the knowledge in question.

From this understanding, the analyzed production on the subject brought subsidies in to understand broadly what it meant and what the effects were until the graduate of teachers in the distance education modality recently introduced in the Brazilian educational context. The surveys were developed, mostly through the field observation and interviews with students and trainers (tutors and academic advisors). So, the perception of those involved in the process was the main source of data of the researchers. The reading done by the researchers themselves towards the learning environment was also a source of submitted data.

Students and trainers of the courses were mostly women who worked in public schools and belonged to different age groups, that means that were together in distance education mode courses and programs, people in the beginning, middle and end of the teaching career.

Regarding the professional and personal development of students who took part in the studies selected, good common points have been repeatedly highlighted by the people involved and selected to be discussed here. Even establishing relations and influences among them, these points can be categorized into: a) *aspects related to professional identity [18], b) issues related to academic education and instruction* and *c) aspects related to the person of the teacher [19]*.

---

[18] Professional identity is how teachers define themselves to themselves and others, being a construction of his professional self, which evolves during his career and that may be influenced by the school, by the reforms and political contexts, incorporating the personal commitment, availability to learn how to teach, beliefs, values, knowledge about

In the first category, in line with Imbernón (1994), it was highlighted by the students the following: it was created a sense of belonging to a specific professional group, especially because of the constant exchange of experiences with peers (solving common problems in classroom, suggestion of activities, sharing joys and frustrations relating to the profession), it was promoted the construction of a professional identity; it was woke up the critical sense in relation to their position in society through the function they perform. Finally, according to the perception of the course participants, the possession of a diploma came to legitimize their place as professionals in education for society and for themselves.

In relation to the academic training, important elements were cited. The improvement of writing, the comprehension of academic texts and the developing of a taste for reading were some of the major changes brought by the courses. The relation between theory and practice during the courses was also highlighted as a significant point that has brought meaning to what was being discussed by several authors quoted in the printed materials, which valued the academic education. In addition, the students revealed that the interest to continue studying was aroused, as well as the desire to be responsible for their self-training [20]. They stressed that as a result of the training received, there was a significant improvement in the quality of their classes. It is evidenced that, to the researchers, it occurred an enrichment on the knowledge of the craft, which is characterized by including the practical knowledge of the representation of the subject, of teaching, built from the interaction between content representation of the subject and practical action, schemes of work and understanding (Ângulo Rasco, 1999).

As a consequence of the aspects above, and in line with Marcelo (2009), aspects of the person of the teacher were also highlighted. Lifting self-esteem, more critical sense, respect for human diversity in its various dimensions (race, gender, ethnicity, etc.), reliability in relation to what they say and what they do and achieving a personal dream are some of the major changes.

Negative aspects were also mentioned by the actors involved. What became apparent, however, is that the criticism fell mainly on the ways of using technological resources and the organization of courses. Namely, support for the offering of the courses - which is the new element brought by distance mode - was the main target of criticism. Among the complaints made, it points up: technical difficulties, lack of adequate equipment, lack of knowledge on the use of equipment, lack of training for the trainers on videoconferencing facilities, teleconferencing and chat rooms. Furthermore, the lack of familiarity in the use of computers and other technological resources from the course participants were a critical point, especially pointed up by the trainers, which cost the utilization of available resources. The printed standard material was distributed in the courses, in its turn, was nominated by the students as the main source for study and attendance tests. The presence of tutors in the learning environment was considered essential to dispel the doubts of many areas of knowledge that arose during the course. According to the information brought by the research, it is understood that the gaps left by the elements that characterize the distance modality were supplied, mainly, by the common facilities to the attendance classes.

It can be seen therefore that the potential uses of information technologies and communication technologies (ICTs) in such courses have not been adequately explored, as revealed in the research, either through lack of technological mastery of trainers and students or by technical failures. This demonstrates the need to rethink the planning of such programs in light of the experience gained so far.

Anyway, according to the perception of the researchers, the use of ICT in teacher training represented for the people involved, an opportunity to obtain a diploma at a superior level, which would not be possible in another way because of financial difficulties and lack of time. Most research have revealed that despite the problems found out, the modality of distance education was of paramount importance, playing a fundamental role in the society for those who have been benefited. It was considered an important alternative to democratize the access to higher education in the country.

---

the subjects they teach, and how they teach them, the experiences and their own professional vulnerability. The teacher identity is the reality that evolves and develops individually and collectively. It is something that develops throughout life (Marcelo, 2009).

[19] Professional development seeks to generate changes together with teachers so that they can grow as professionals and as people (Marcelo, 2009).

[20] In this context, speeches that show the assignment of value to the possibility of a personal permanent training, non-transferable, that depends on them were propagated. Thus, teachers in initial higher education contexts try experiences that clarify that their becoming does not cease with the diploma, which seals the professional position, since they are related to a permanent training that will combine periods of experiential training with the ones more formal, according to alternations to be created for each subject (Pineau, 2004).

However, while the democratization of the access to education is fundamental, the state generated from this new way of promoting higher education needs further studies that examine the changes brought about these courses on the practice of teacher in the classroom, making possible, thus, to develop a more comprehensive analysis of the process of distance training set in a rapid and massive way in our country. After all, consider that the minimum qualification of teachers is better than nothing reveals a clear inconsistency between discourses and practices.

CONCLUSIONS

This study deals with central issues on the post-secondary education regarding the personal and professional development of the teaching profession of the early years of schooling in order to point up the effects of the courses offered in the core of expansion policies of providing vacancies in Brazilian higher education in undergraduate courses for the diploma of teachers already working in public schools and future teachers after the promulgation of the Law of Directives and Bases of National Education (Brasil, 1996). Along the way, it was emphasized the results of the developed research in the country that as the main corpus analysis the higher education courses offered in the distance mode, pointing out positives and negatives results that emerged repeatedly in the development of the analysis defended in the Brazilian postgraduate programs.

The collected data refer to aspects categorized as related to professional identity, academic training and instruction, to the person of the teacher and to uses made of technological resources. These aspects aroused from the analysis conducted by researchers from the manifestation of those involved in the training process for the certification of teachers who are already working in a massive and rapid way. It was observed, however, that there are significant gaps in the academic production, especially regarding the analysis of practices developed in schools of basic education by the graduates of these sorts of course. It is also necessary that more comprehensive research are conducted in order to examine the implementation of distance education college courses as part of a public policy that has pre-defined statistical targets to be reached and, above all, that has been establishing itself as one of the main ways to train teachers in basic education of Brazilian public schools.

Abstract: This paper is a reflection on the practice experienced in the period from 2001 to 2008 as a teacher educator at the Faculty of Education at the State University of "Vale do Acaraú, Pólo-Natal", in Brazil. It aims to analyze the underlying processes to the educator´s practice and professional development in the curricular context. It is noticed that at the pedagogical discourse in recent years, the teachers' role and the education have been posed as essential in order to educational institutions from ahead the challenges of modern society. In Brazil, according to the Law of Policy and Bases of National Education, number 9.394/1996, the Article 13, I, determines that one of the teachers' role is to contribute to the development of the curriculum design in the institution. However, in most institutions such participation has been given much more in terms of operationalization of the official curriculum, that is, it has been restricted to the technical or functional level. At the University, as it constitutes a decentralized Pole of education, teachers' educators are often invited to act as developers of the proposed work and reviewers of the educational curricula, as well as they are challenged to think and decide about possible alternative methodologies appropriate to the teacher education context. This experience highlights two relevant aspects: the first one is that curricular management and the autonomy are intervening and dominant variables in teachers' practice and professional development and secondly, the practice as profession can provide teachers with a training and self-education that promote a broader dimension of professional development. Thus, the selected theme refers to the complexity of pedagogical, political and ideological relationships that compose the education, in broad and restricted sense, that is, it demands teachers acting, building and rebuilding themselves, being a teacher at the individual and collective fields. In this perspective, teachers are reflexive agents, builders and managers of the curriculum with ability to become agents of their own biography (Freire, 1996; Pacheco, 2008; Morgado, 2000; Goodson, 2001; Roldão, 1999). The research to be presented was based on a qualitative methodology involving discourse analysis, document analysis, as well as field research with survey questionnaires with open questions to a sample of five teachers from "Vale do Acaraú, Pólo-Natal" University, Brazil. The partial results will be addressed during the communication. It should be noted also that in order to develop the proposed analysis we used the theoretical framework from the master on teachers´ education, as well as those from the ongoing doctoral project in the area of education.

Keywords: Curriculum. Teacher. Practice and Professional Development.

INTRODUCTION

The discussion of the practice as professional development inplies placing it in a conceptual discussion on the epistemological field, political and ideological of training, and in particular the very term "Professional Practice" as this, throughout history, has been used with different meanings and understandings. The pedagogical discourse from the 1990s, in Brazil, examines the discussion of professional practice in two dimensions: 1) professional practice as the practice of teaching. 2) Professional practice as a curricular component, as a body of knowledge, strategies and techniques learned in the school process.

Buriolla (2001), Tardif (2002), Ramalho et al. (2003) and Pimenta (2004) emphasize these two dimensions of professional practice as inseparable processes with mutual involvement. In this study, the practice will be addressed from the perspective of the profession combined with teacher professional development. The text contains four sessions: first, to discuss the concepts and methodology of the study. After, we will establish the context in which subscribes to the experience and perspectives of teachers. Finally, the considerations and references.

CONCEPTUAL AND METHODOLOGICAL DIMENSION OF THE STUDY

The question of the epistemology of professional practice is at the heart Movement the Professionalization of education[21] and of Teachers, launched in the United States of America, in 1980 and 1990, in a paradoxical context, that required professionalism of teachers at a time when all professions, including the professions most outstanding (Medicine, Engineering, Law) went through a period of deep crisis. This movement represented an attempt to reshape and renew the epistemological foundations of the profession and teacher education (Tardif, 2002).

Ramalho et al. (2003), citing Braslavsky (1999), says that during this period, in the context of Latin America, the movement to professionalize the teaching and the professor was supported by the finding of a technical deprofessionalization linked to an increasing devaluation of their work, in that the teacher was thought of as a consumer of scientific knowledge. Due to this design, in Brazil, it was developed an emerging hybrid training model based at technical and at training Academicism traditional. But also emerging movements driven Anped (1999) and Andes (2004)[22], that invoke and pointing to a new reference and training teachers' professional practice, based on the articulation between theory and practice.

At the time, in Brazil, the question of building a framework for understanding the professional teacher is complex, since it is mediated by various contextual variables, such as massification, devaluation and various interference: of parents, the state and the of administrators in the teacher's work. The process of professionalization, in fact, sought to overcome the inertia of intellectual, social and political activity of faculty, more than questions of competence and qualifications, meant a matter of power, autonomy and authority public and social Because "the teacher builds knowledge, skills, not to individualistic and competitive autonomy, or for an authoritarian power, but to educate in the perspective of socialization, namely by promoting the inclusion, not exclusion" (Ramalho et al., 2003, p.39).

Corroborating this discussion, Pepper (2004) emphasizes that profession and professionalization refers to the characteristics and ways to pursue a particular activity and the objective conditions of their practice as well as the requirements to enter thereon. However, teachers in the profession have specific knowledge that are mobilized, used and produced by them as part of their daily tasks. [...] Which is proposed from this assumption is to consider the teachers as individuals who possess, use and produce knowledge specific to their craft and of their work (Tardif, 2002, p. 113).

To Buriolla (2002), the basic reference of the action in professional practice is conceive the man as a historical reality in which relations emerge mainly from the correlation of forces determined by the dynamics of social reality. With regard to the teaching profession, the teacher is a professional man that helps the personal development of the students, being a facilitator of access to knowledge; is a being of culture that dominates his area of expertise and scientific-pedagogical education and its contributions to understanding of the world; a critical analyst of Society, that it operates with her professional activity, a member of a scientific community that produces knowledge about their area and about the Society (Pimenta & Lima, 2004, p.88).

Teaching is a specific field of professional intervention in social practice - not is just anyone that can be a teacher because the teacher identity is constructed along its path as professional teaching and in the process of their professional development, in that are consolidated the options and intentions of the profession. It is in the scope of practice that teachers live the experiences of objective conditions. Often these places are marked by situations of wear, fatigue and disillusionment and social problems whose solution is far from your area.

Methodological dimension of the study

This reflection in form of communication has at its base the understanding that, given the frequent changes to educational institutions, the challenges posed to the teaching practice, the requirement of teachers assume your professional Develop, it is necessary to recognize as a subject with critical skills, reflective and to have some professional autonomy.

"As an agent of the curriculum, the teacher becomes a professional who critically analyzes your work. Their role is not merely a executor or consumer curriculum as you attribute the centralized curriculum models, prescribed and closed" (Pacheco, 2001, p.164). In this sense, give voice to the teacher to think and analyze

---

[21]The movement of the professionalisation of teaching faculty is an urgent appeal to university researchers in the field of Education to build a repertoire of professional knowledge for teaching (Tardif, 2002).

[22] ANPED National Association of Graduate Studies and Research in Education.
  National Union of Teachers of Higher Education Institutions, ANDES-SN.

their own practice is a step change in paradigm and effective changes within the school (Giroux, 1986; Schön, 2000; Alarcão, 2001).

Seeks to rescue the authorship of the teacher in the field of discourse and pedagogical practice, therefore, the authorship, "which is a unique appropriation of reality and way of intervening in it, leads to the opportunity of the authors (...) produce skills more or less relevant and the feasible in managing the complexity of the events quotidiano (...) and make visible the hidden face of his being in the world (inter)-action and (inter)-training "(Silva, 2007, pp. 303-304, emphasis added).

Thus, we selected five subjects from the universe of ten teachers whom were actively engaged in curriculum practices in the Faculty of Education in the State University Valley Acaraú at the general level of administration the curriculum and the classroom, in the period 2001 to 2008. These teachers were inquired through a questionnaire with open questions that focused on the legal requirements on teacher participation in educational projects in the institutions and their perspective about their professional development and teaching practice in the context of the institution. The teachers' answers were analyzed in light of discourse analysis, considering the subject of reflexivity, which "refers to the fact that humans are self-conscious beings capable of thinking about themselves" (Jardine, 2007, p.33). In the field of collection and data analysis we also use the document analysis.

We emphasize that the study fits into the paradigm of qualitative research, in which "the data were not collected in order to confirm or disprove hypotheses built previously, instead, the abstractions are built with private data that were collected and that are be grouping "(Bogdan, p. 50). We recognize that the qualitative and quantitative aspects of the events and social relations "are their inherent properties, therefore, indivisible and independent, thus occasioning the dissolution of dichotomies quantity/quality, macro/micro, interiority and exteriority" (Minayo, 1999, p.11).

CONTEXTUAL AREA OF EXPERIENCE: between theory and practice

The institution that was the experience is a dismemberment of the State University Valley Acaraú, who works at another federal state of Brazil, Ceará State. This university, since 2001, took over the project and expansion of internalization of higher education for all teachers in different Brazilian states, with support of the Law of Directives and Bases of National Education, Law 9.394/1996, which states: The training of teachers for working in basic education will be taught in undergraduate courses at universities and institutes of higher education, as allowed for minimal training exercise of teaching at the kindergarten and the first four grades of elementary school (Brazil, Law 9.394/1996, Art 62).

This legal determination was contrary to previous reality, in which the middle-level teacher training (that occurred in secondary schools) was requirement to work in the early grades of basic education. And also sought regulatory the table irregular teacher training that did not meet the new demands of current social reality, as shown in the table below.

Level of Training of the teachers working in elementary school 1991 to 2002

TRAINING / YEAR	1991	1996	2002
Until the level of basic education	17,4%	15,3%	2,8%
No formation of teaching	5,7%	1,8%	2,9%
Formation of teaching high school	57,7%	61,1%	64,0%
College without formal training in education	0,9%	1,8 %	3,9%
College with formal training in education	18,3%	18,5 %	26,4%

Source: Derived from the INEP, Statistics of Teachers of Brazil, 2003.

The Law 9.394/1996 caused significant change in the context of teacher education considering the low level of training: largest percentage the formation in teaching high school, even, different situations from subjects who barely finished his elementary school and has joined as a professor in the education system and also the situations with professionals working without proper training.

The legislation, in a sense, forced to supply and demand for higher education at undergraduate level, from a total of 2.512 courses in 1991 for 5.880 in 2002. The growth of enrollment was 90%, involving a quota of 1.059.385. In 2001 completed courses in teaching profession a total of 176.599 students (INEP, 2003)[23].

It is noteworthy that such requirement of Law 9.394/1996 must be understood within in the framework of international and national policies for teacher training, as well as within the framework of reforms in the Brazilian national system of education in the 1990s. It was understood that teachers will be the protagonist of

---

[23] INEP, Statistics of Teachers of Brazil, 2003. http:www.inep @ gov.br

the reforms within the classrooms and basic education a cornerstone for achieving the nation's development. Thus "the politics of teacher education should emphasize the recovery and ongoing qualification of teachers" (Silva, 2006, p.75).

Widened the range of locus of professional training of teachers and different actions and programs have emerged. In this context, the State University Valley Acaraú (UVA) have been decentralized their training activities from partnerships, expanded teacher training courses, initially at the level of the course of bachelor in Pedagogy.

This institution, with its headquarters dismemberment of Sobral, a city of Ceará, in different Brazilian states, has served various municipalities in the state, with regard to teacher training. The Course of Pedagogy Undergraduate Full Degree, offered by the institution is recognized by CEC[24], through Opinion nº 0994/98 of 21 October 1998. The UVA has offered, with great success the same way throughout the State of Ceará and 12 more states in the federation of the Northeast, North and Midwest "(http://www.ibrapes.com.br/graduação _pedagogia.php).

In the state of Rio Grande do Norte, Acaraú Valley State University, public institution in the format of an agreement with the Brazil Institute for Research and Higher Education (IBRAPES), of private ownership, operates in 50 municipalities offering training in the initial series Basic Education, also has operations in training courses Postgraduate.

The teaching staff consists of former teachers with extensive experience in the field of training for teaching, being a retired professional Brazilian public universities and also professionals who have their first experience at this institution as teacher trainers in higher education courses. To act in the training courses is required Postgraduate Sensu Lato (specialization) or Stricto Sensu (master's or doctorate).

It can be seen, under the circumstances and political and ideological beliefs that teachers occupy a space not only in classrooms, working knowledge of the modules, but also outside of the classroom, in group work with its partners under the coordination of the educational institution's Board. These spaces are discussed and decisions regarding curricular issues involving the updating of knowledge learned in the different modules based on the analysis and selection of content as well as through development of methodological proposal for the organization and implementation of work plans. The Professor A caveat to that participated in the survey questionnaire: "Where are inserted into new disciplines teachers who work in these are called by management to participate in drawing up menus, programs, select bibliography, etc. ...". In the same direction, says Professor B: "I have selected authors, scholars in this field, working in the training of students the favoring to improve school practice."

According to Morgado (2000) there is a direct relationship between the curricular autonomy and responsibility displayed by the teacher assigned to it in this sense that autonomy is usually referenced to a base in aspects of the teaching process: objectives, content, activities and teaching resources, textbooks or textbooks or in relation to assessment of student performance. In each of these respects the autonomy of the teacher suffers varying degree either in regard to wide autonomy, whether at the individual and the community. According to the author, for teaching purposes, the choice of textbooks, manuals, and assessment of student achievement, autonomy takes place in the collegiate level leading to the exchange with other teachers, while the activity and teaching resources on individual and personal the teacher has broad autonomy. Regarding the content has lack of teacher autonomy due to the existence of programs previously prescribed.

In centralized or decentralized management, however, autonomy may happen for different reasons. The teacher autonomy in relation to the contents can happen due to the ineffective control the instruments curriculum and the can occur at the perspectives of autonomy built, that implies a political decision. In author perspective, the autonomy built as a collective process that no disregarding the principles and objectives of the national educational system, is structured according to specific goals of the school determined in accordance with their specific local conditions. "Thus, the autonomy of the teacher is always limited because it comes under the focus of responsibilities (functional domain) and compliance with goals and values macros (Morgado, 2000, p. 53).

Actually studied, decentralized management under the functional approach and teaching is linked to the curricular autonomy, requiring teachers to participate in the plan of course. Professional autonomy is limited to educational and Formation goals of the institution but to the extent that teachers work on curriculum development as managers in the specific context of the classroom, as well as in the broader space of the institution will constitute, knowledge and consciousness that boost your professional development triggering

---

[24] Board of Education of Ceará

other processes of self-education and administration. As evidence in the argument of a teachers who participated in the survey:

"My academic practice and profissonal has changed a lot since my tenure in the institution UVA, while teacher. When I joined in 2002, the my highest level the expertise courses Postgraduate Sensu Lato (specialization). Had three and one of them was the Curriculum: Theory and Practice. Hence, while teacher, realized my students in difficulty and lack of reading and writing and noticed that these hindered the formation and continuity of studies. So I had to also seek to enrich me as an apprentice how to minimize this situation and the solution,, I sought help through my own continuing education at another institution, to delve into the matter further and also develop the research as an object of study" (Interview to teacher).

In this sense, it seems that the practical knowledge and knowledge derived from professional practice mediated by self-reflection, as well as coping with the constraints can lead to decision making in the daily practice of the teacher constitutes mechanism or means for his development professional. Seems that there is a process of imbrications, while the teacher reflects on professional practice and has his classroom as a space for reflection and pedagogical renewal happens your professional development from skills acquired through critical reflection and self-criticism.

Schön (2000) argues that when teachers have opportunities to find degrees of freedom to reflect during and after their practice, give meaning to their own work and thus put to test his own understanding of the process in which they are immersed.

We also understand that this process plays a fundamental role of the moments and movements that involve the teaching course, as the planning of pedagogical actions that involves the selection of methodology and evaluation and also the dialogue with his students and colleagues. In this work through reflection and self-reflection and collaboration, the teacher makes reframing the knowledge and to do it also reframes the practice.

In this process of change from inside to outside, the teacher becomes critical and self-critical of your professional activity, autonomic in the process of decision about their further education and their teaching praxis. Thus, the critical reflective and practices and coexist with professional development. The decision-awareness requires continuous questioning of their ideas and knowledge (Carrilho, 2002) therefore "focuses on the professional capabilities of the teacher being seen as an all in their cognitive, affective and relational" (Herdeiro, 2010, p.156).

This sense, based on the theoretical and our experiences as a teacher trainer in the institution, we understand professional development as a process that occurs in two dimensions, namely: the external organization of professional development and internal organization. The external professional development can be understood as a synonym of training courses organized by training institutions[25] and managers, aiming to foster completion of initial training or as rewarding difficulties, or even to meet changing demands and curriculum policies. In this dimension of professional development, training institutions assume the management of this process, constituting a "serious and decisive basis to maintain and improve the quality of teachers and managing school"(Herdeiro, 2010, p.162) and teaching. This process can is being managed by the school where the teacher works. Thus, the school can play an important role in Develop or professional teacher, becoming in space and moments of reflective learning (Roldão, 1999) and training in considering their beliefs, values and sociocultural and political environment (Veiga Simão, 2007).

The professional development in the internal dimension happens from certain specific knowledge acquired in professional practice with and referenced by Tardif (2002) and intrinsic factors. There is a movement of professional growth from the inside out, with the teacher who runs the decisions and projects that seek to develop, as well as the way want to run (Herdeiro, 2010, p.31). Here learning also happens in the context of one process of reflection, self-reflection, awareness and decision-making as an autonomous individual. Professional development is a continuous process of learning, recognizing "the need in each school, creating conditions curricular and pedagogical practices of teachers whom work there" (Morgado, 2007, p. 48). We can represent the two dimensions of professional development as follows:

---

[25] Christopher Day, analyzing the Draft Continuing Professional Development of Teachers (DPC), implemented in the United Kingdom, warns that focusing on school-based has gained popularity in European countries, through partnerships between schools, organizing themselves into learning communities Network (Day, 2007, p.30).

PROFESSIONAL DEVELOPMENT

External professional development

Involved:

. Institutionally organized course plan, training to supplement initial training or as rewarding difficulties, compliance and evaluation of curriculum elements. Physical space for training and professional mediation. Systematized learning from the outside.

Comportamentos Mensurados.

internal professional development

Involved:

Organization staff from the processes of reflection, self-reflection and collaboration, professional practice, processes intrinsic to the subject, making awareness of the complexity of practice, autonomy and decision of the teacher. Learning from the iinside out

It is noteworthy that both processes are different in their aspects and procedures involved, but also complement each other. In external professional development, which involves the intentional organization of educational activities based on "measurable behaviors (competencies and skills), also professional development occurs intrinsically, in that the teacher mobilizes different knowledge and experiences. This process is unique to each professional because it involves several variables, such as: social, political and ideological motivation and processes of identification with the profession.

It is worth mentioning, though, the influences of policies that guide the professional development process and the pedagogical practice, in which autonomy teacher the information processes become much more discourse for regulation of education systems that emancipatory practices. According to the five professors who collaborate in this study there is agreement that despite the experiences in the institution, the issue of autonomy and assumed as manager and co-manager of curriculum development in general, is still much more found in legal texts than in the practice of teachers.

For Lima (2007), cited by Formosinho (2008) in the context of current reforms are given to teachers and education institutions the autonomy in a logical transfer of certain powers, becoming a technical or functional autonomy. "Although the rhetoric of curricular autonomy, the practice is quite different" (Pacheco, 2001, p.164).

In this context, even that the policies are training for teachers covered by a facet of technical rationality coupled with the logic of the market (Goodson, 2001), curriculum while the text is written by the teacher in daily life of the institution and the classroom interacting with students and according to their personal and cultural experiences (Pacheco, 2009). It in is contradictory this field, the teaching practice is fundamental to trigger professional development processes in two dimensions placed in the text. The experience here is discussed in view of the possibilities and realms of practice, autonomy and curriculum development processes genuine promoters of professional development.

CONSIDERATIONS

The convergence of practice and professional development of teacher educators from the Faculty of Education at the State University Valley Acaraú, seem to go through the learning context leaven in the spaces for reflection, study and collective decision-making around the methodologies of Grela review of content and student evaluation, fostered by the autonomy and decentralized management curriculum, although the functional format, can be represented by the chart below.

CONVERGENCE BETWEEN PRACTICE AND PROFESSIONAL DEVELOPMENT
Thus, under the decentralized management and curricular autonomy, with the participation of teacher educators in a complex network of relationships that intersect in internal and external factors, the group of teachers has the opportunity to do an ongoing review of professional practice with based on the narrow relationship between theory and practice.

We understand that professional development is interwoven in practice that the teacher aware of the complexities and implications of teachers' action is open to change processes and a self-questioning of the exercise of its function in the individual and as a member of a collectivity. In this sense, professional development, whether in internal or external dimension is a complex process and concerning the different learning experiences (natural, consciously planned and carried out by direct or indirect benefit, helping improve the performance of the teacher in classroom (Day, 2001), likely to impact on student learning.

Finally, we note that this communication is a brief reflection of my experience as a teacher educator, in order to contribute to the discussion in the field of practice and professional development, in view of the conceptual paradigm of the subject teacher as critical and reflective capacities (re) invent the process of training and professional practice.

95 - Education Policies and Teachers' Professional Development: The Perceptions of Elementary School Teachers

Rosalinda Herdeiro[1] and Ana Maria Costa e Silva[2]

[1]Research Centre in Education, University of Minho, Portugal,
rosbrito@aeiou.pt
[2]Department of Curriculum Studies and Educational Technology, Institute of Education, University of Minho, Portugal
anasilva@ie.uminho.pt

Abstract: This paper is part of ongoing research undertaken for a PhD thesis in Education Sciences, specialty of Curriculum Development. The objective is to understand the impact of recent legislation – Teaching Career Statute (TCS) and its respective Evaluation of Teacher Performance (ETP) – with particular emphasis on the (re)construction of the identity, career and professional development of teachers.

In this context we were able to formulate these research questions: do the government's education policies encourage teacher development? Will opportunities for teacher development be created in schools? Will the goal of improving the quality of teaching be achieved in education contexts sustained by teaching *malaise*?

In this paper we shall explain the perceptions of elementary school teachers recounted in written and oral biographical narratives and in three discussion groups set up for the purpose. In addition we present some of the results yielded by responses to a questionnaire sent out to 396 elementary school teachers and their statistical analysis using the chi-square test and t-test.

The professional experiences recounted by the teachers suggest outcomes different from those foreseen by Portugal's policymakers, emphasising the weaknesses and inapplicability of the core objectives established in the legislation on the Portuguese system.

Keywords: education policy; professional development; teaching quality.

INTRODUCTION

At a time of complexity and change, European schools, and particularly their teachers, have often been faced with (new) demanding challenges that entail ever-more refined professional skills, with repercussions on the teacher's work, professional development and career.

In recent decades the changes have "challenged the professional autonomy of teachers and raised the question about what it means to be a professional under public scrutiny that is increasing all the time" (Day, 2001, p. 21), arousing in the European Community a concern to stimulate education contexts for change.

So policies for change have to be instigated that promote healthy education environments, i.e. ones that see school not simply as a source of information, but more importantly as a place of motivation and learning – for students and teachers alike.

Education requires highly qualified teaching, acquired in different forms from those used so far (Dean, 1991), basically focused on teacher professional development with "emphasis on collaboration, cooperation between teachers and anyone else who is legally responsible for education" (Day & Sachs, 2004, p. 7), without teachers abdicating their status of "custodians of their professionalism" (Silva, 2007, p. 162) during their teaching career.

PORTUGUESE EDUCATION POLICIES AND PROFESSIONAL DEVELOPMENT OF TEACHERS IN THE SCHOOL

Schools have always been influenced by a country's historical and cultural changes in the economic, social and political sectors which have interfered in school organisations, specifically in teaching and in the skills and content to be taught to students.

The consolidation of the right to education that has led to the appearance of educational communities whose characteristics are heterogenic and changeable, which has implications for the need to coordinate the action of teachers, has paved the way for discussion and consideration of schools and their main actors.

These circumstances have led to a new conception of professional performance based on strategies that can ally quality of teaching with quality of learning (Morais & Medeiros, 2007), leaving no alternative but to

review attitudes, conceptions and methods and create a climate of professional development within the school.

With the publication of the Basic Law for the Education System[26], another milestone in Portuguese education was built. It determined that schooling for nine years (elementary education period) should be universal, compulsory and free, and repeated other aspects, including the right to and the democratisation of education, as established in the Portuguese Constitution of 1976.

But the major innovations of this law were its reorganisation of the education system (elementary, secondary and higher), and the broadening of the concept of school, taken as an education community belonging to a system of relations with parents and local political bodies, based on an autonomous educational project and shared by all the interested parties in the process (Afonso, 1998; Correia, 2000).

In this context it has to be mentioned that, in the wake of the publication of the Basic Law for the Education System and identification of the economicist intentions of society, the issue of teacher assessment reappeared on the political agenda. The first assessment model emerged in the early 1990s[27] and its aim was "to strengthen the autonomy of schools and foster the professional development of teachers" (Curado, 2002, p. 39).

The Teaching Career Statute, published after extremely vigorous trade union action, favoured the introduction of the most innovative element in the teaching career – the creation of a *single career* (Alves-Pinto, 2008), consummated with the publication of Decree-Law 139-A/90.

With the publication of this law, performance assessment became a necessary and meaningful premise, but trade union leaders believe that its operationalisation needs to consider very carefully the *kind of assessment* to apply (Alves-Pinto, 2001). Following discussions between the unions and the ministry of education, the TCS ended up containing an intrinsic form of assessment, because the assessment could not be a bureaucratic process. It was basically a report of what each teacher had done and, if it was made at a specific point in the transition from the 7th to the 8th scale it was based on the preparation and discussion of the person's professional CV before a panel.

The law under discussion has now been amended, leading to another one[28] – designed to optimise resources and reduce the weekly lesson load for students, by cutting the 'project' area from the list of non-subject curriculum options and placing more emphasis on supervised study so as to encourage autonomy and improve school outcomes. The intentions of this law are being contested by the teachers, backed by the unions, because they once again disagree that the economic woes of the country should obstruct the course of education and hamper the adoption of high quality education.

In Dean's words (1991), professional development suggests a process whereby teachers become more professional. So professional development can be seen as growing in certain aspects of professionalism and can be legitimately applied to the development of a teacher or group of teachers, in the work context, where the emphasis is on reflection (Herdeiro, 2010).

Morais and Medeiros (2007) add that the most important part of professional development "is the broadening and self-development of professional knowledge" (p.33) thereby valuing essential premises like teachers knowing their individual mental structures, the thinking that influences their actions/attitudes in the classroom and peer relations.

According to Day's (2001) line of research, we see that the interaction of various professional experiences that happen during their teaching life with the contexts in which they work – from the classroom and school to the social and political contexts – derives from teachers' reflection and action. This conditions their attitudes towards the need for professional development.

For Morais and Medeiros (2007), the professional development initiatives promoted by school groupings/training centres should help teachers to "acquire and develop teaching strategies and techniques which may effectively promote the active construction of the students' learning's meaning and its self-regulation" (p.35).

So we may ask: does the latest legislation passed in Portugal stimulate teachers' professional development in the school? Or does it help to drive the factors that inhibit their professional development?

Very recently an international study by Flores, Veiga Simão, Rajala and Tornberg (2009) has confirmed the influences mentioned earlier and was able to pinpoint a range of factors that inhibit teacher development in social environments (economic crisis and devaluation of teaching profession), personal environments (professional demoralisation), education system-related environments (legal uncertainty, too much red tape),

---

[26] Law no. 46/86, of 14 October.
[27] Regulatory Order 14/92 of 4 July implemented the first teacher assessment policy.
[28] Decree-Law no. 18/2011

and environments related to school organisation (lack of stronger leadership, activity overload, increased red tape).

This obsessive legislative frenzy by governments to impose targets on teachers, regardless of the culture and context of the educational contexts has been hotly opposed in schools, preventing teachers from developing professionally and significant changes from being introduced (Pacheco, 2002), the latter remaining "in the field of expectations that they have generated" (Morgado, 2005, p. 76).

The upheaval and conflict in the world of education continued throughout the decade and reached its peak in 2007 when the Ministry of Education, unmoved by the theoretical considerations of experts in education, reformulated the TCS[29] and regulated the teacher assessment process[30] based on the policy of the 'need for change' without preparing educational contexts.

The unrest, challenge and resistance of the teachers to the changes has lasted, on the whole, until this year, forcing the ministry of education to undertake a series of revisions of the TCS in response to the climate of *malaise* and inability to establish conditions favourable to the implementation of the assessment process in schools.

So, after yet another (re)appraisal of the various stages of the assessment process, particularly the most fiercely contested ones, the Ministry of Education decided to simplify it to make it easier to apply.

After three years of constant strife (2008 to 2010) with the Ministry of Education, teachers and unions finally saw equality between teachers restored, putting an end to categorising them as 'classroom teachers' and 'senior teachers', and so reinstating a single category for the teacher career structure[31].

The principles governing the change in the TCS were established in Regulatory Order nº. 2/2010 of 23 June. The criteria of rigour and appreciation of professional merit were maintained, and it was established that performance assessment should be carried out under simplified procedures, with the rapporteur[32] monitoring the assessed teacher's performance and permanently interacting with him/her.

But more legislation has been passed very recently to account for an assessment process which, from the very start, was clearly unsuited to the Portuguese educational contexts. Its implementation on the ground remains dubious, regardless of being patched up, and this is creating significant and widespread mistrust in those most directly affected by the assessment – the teachers.

Through the theoretical contextualisation and the content of current education and curriculum policies in Portugal it is wholly pertinent to mention the perceptions of elementary school teachers with respect to the main factors that hamper their professional development in school: competition and individualism; the escalation of tasks; excessive red tape, and professional demoralisation.

METHOD

Our reference was the contextualisation outlined briefly above, to undertake research as part of a PhD project with elementary school teachers. Some of the results are presented in this paper. The main purpose was to identify the elements involved in teacher professional development and the (negative) implications that recently passed legislation has for professional development in the school.

Among the goals of this research – those that interact most directly with the outcomes presented and discussed here – are: i) to identify the views of elementary school teachers on the recently passed legislation; ii) to learn the impact of the laws on teacher professional development; iii) to examine the factors that inhibit professional development in school.

We thus chose to combine quantitative and qualitative research approaches for our study.

In phase one, in 2008, the eight elementary school teachers recounted their perceptions after the TCS and EPT laws had been published, with implications for the (re)construction of identity(ies), for the career and for professional development.

In phase two, in 2009, a questionnaire was designed. It contained closed and open questions and Likert scales and was based on the outcomes of the narratives, the legislation and a literature review. It was sent out to 396 elementary school teachers who are working in the same schools as the eight teachers whose accounts had been collected. This was our sample.

The questionnaire was returned by 63% of the teachers (249 of the total) and these were then processed and analysed with the SPSS programme (Statistical Package for the Social Sciences), version 17.0.

---

[29] Decree-Law no. 15/2007, of 19 January.
[30] Decree-Law no. 18/2011
[31] Decree-law no. 75/2010, of 23 June
[32] The rapporteur is the member of the assessment panel responsible for monitoring the professional development process of the assessed teacher, with whom they remain in permanent interaction so as to enhance the training aspect of performance assessment.

In 2010, the last phase, the teachers who had volunteered to take part in the next phase when they completed the questionnaire were put into one of the three discussion groups that were formed to identify the internal aspects of the issue under discussion, through subjectivities shared and assimilated by the group to construct their own discourse in the context. Later on in this phase the key-informant eight teachers were again asked to give an oral account of their perceptions and experiences in school, in recent years.

Table 1: Summarise of our research

	Phase 1	Phase 2	Phase 3
Informants	8 elementary school teachers	249 elementary school teachers	20 volunteer elementary school teachers 8 elementary school teachers
Data collection method	Written biographical narratives	Questionnaire	Discussion groups Oral biographical narratives
Period	October - December 2008	June - December 2009	March - May 2010

The operationalisation of the phases enabled us to get useful information, almost to saturation point, to obtain valid responses to the research questions, i.e. information that ensured the comprehension and appreciation of the *voices* and *feelings* of the teachers in their professional practice, in light of recent changes in education.

Characterisation of the sample
Of our sample we should note those who have been with us since our Master's thesis (2006/2007): the eight elementary school teachers who have been hugely important, giving the information very easily because they have real knowledge of the events and because of their willingness to impart this knowledge in a spirit of constant cooperation.
These teachers are still our "key informants" (Gómez *et al*., 1999), especially in **phases 1 and 3** of our study. Table 2 summarises their relevant personal and professional details.

Table 2: Characterisation of the eight key teachers

Teacher	Characterisation					
	Grouping (Vertical)	Age	Length of service	Category	Duties	Education
Sónia	B	36	14	Teacher	Establishment coordinator	First degree
Patrícia	C	39	13	Teacher	-----	First degree
Amélia	G	47	21	Senior teacher	Establishment coordinator	First degree
Carolina	E	39	14	Teacher	-----	First degree
Elsa	D	39	13	Teacher	Establishment coordinator	Master's
Catarina	F	38	13	Teacher	Establishment coordinator	First degree
Diogo	A	53	27	Senior teacher	Year coordinator	First degree
Gabriela	H	43	22	Senior teacher	Teachers' council coordinator	First degree

Of the 249 respondents to the questionnaire, 80.7% are female and 19.3% male, which signifies the predominance of women teachers in the groupings surveyed.
In terms of age, there were more in the 31 to 40 age bracket (39.0%) and in the 41 to 50 bracket (30.5%).
In terms of education, 85.1% of the teachers have first degrees (licentiate), 5.6% had already shown a personal/professional interest in doing a Master's and 8.8% have the qualification provided by their initial training (Bachelor's degree).

Most of the teachers (48.2%) are in an insecure professional situation because they are still under contract. The teachers with the most professional experience in the Grouping Table and Pedagogical Area amount to 51.9%, balancing the percentage of teachers under contract.

Finally, another significant figure characterising the respondents is length of service, with the highest percentage being those with less than 10 years' service in teaching, or 37.8%. Next highest was the percentage with 11 to 20 year's service, 30.9%.

Teachers with up to 20 years' service (68.7%) is a well-established group in terms of career and professional experience.

After this brief description of our sample, we should stress the longitudinal nature of the research. This aspect makes it somewhat unusual among studies that investigate the *experiences* of teachers with respect to how they develop and perceive themselves over their professional career.

In this article we shall explain the perceptions of elementary school teachers recounted in written and oral biographical narratives collected in the two phases mentioned and in three discussion groups set up for the purpose. In addition we present some of the results yielded by responses to a questionnaire sent out to 396 elementary school teachers and their statistical analysis using the chi-square test and t-test.

RESULTS

Factors impeding professional development

Competition and professional individualism
Teachers currently feel more anxious about the *birth* of a (new) professional and personal relationship in the competitiveness that dignifies the rivalry between teachers so as to achieve some gain, as we were told:

> *"(...) I've noticed a certain rivalry and I see that people, when they do something that they even think that it's, that it's good, that has results, that leads to people making progress and they notice, they try to hide it (...)"* (Patrícia, oral account/2010),
> *"(...) because, I'm the one who's going to benefit from my assessment... and worse, I'll gain advantage from my assessment if the others don't, because if I stand out from my colleagues, I'm going to benefit"* (Mário, GD2).

Competition is an acquired reason that our culture chooses to strengthen, not caring about the professional goals of others, ignoring team work in schools, inevitably ruining all the efforts that have been made in schools to sustain teaching in a relationship of collaboration, as teachers explain:

> *"This is no good, it's terrible, it's not bad, it's appalling, it means that I'm getting ready to stride ahead of all my colleagues (...)"* (Mário GD2).
> *"They don't share, or if they do it's a lot later, so that someone will know that it was their work, and I'm not used to this, I've come from somewhere where this didn't happen, where teamwork really was the norm (...)"* (Catarina, oral account/2010).

So teachers are 'shutting themselves into their own world' and forgetting about the others, choosing the times to show themselves publicly, preferably when their superiors are around, to please them and show that they are doing different *things* and doing them better than the others, believing that they shine in the group, as we were told:

> *"And people are starting to close up, I mean they show something as a good result, but don't tell you anything else, really so that you won't do the same (...)"* (Patrícia, oral account/2010)
> *"Teachers like to be noticed for new things when their superiors are around (...)"* (Elsa, written account/2008)
> *"(...) the people who do well are those who do really nice things, I think that's it, I really think that's it..."* (Moura, GD1).

In a competitive environment, it is rare to find teachers helping one another, since they are fighting for their own objectives to get the advantage, the reward, the position they want – a "Very Good" or "Excellent" rating on the performance assessment, the coordination of a project, for instance – pleasing the students'

parents and showing indifference to the (negative) consequences that can affect the teaching body, even finding that this type of relationship does nothing for teaching professionalism:

> *"(...) we're looking to see who's doing nice things in the classroom (...)"* (Camila, GD2)
> *"(...) with my colleagues there's a lot of interest in wanting to be better, mostly with the parents, showing more (...)"* (Ana, GD1).
> *"(...) not being synonymous with a good professional"* (Q. 106).
> So the culture of teaching competitiveness leads to the reinforcing of an individualist culture, discouraging a collaborative culture based on sharing and a spirit of solidarity found in some schools which, finally, once again fell into the realm of individualism, as Diogo says:
> *"(...) sharing, the spirit of solidarity, not now common in schools, apart from exceptions that break the mould, they've definitely descended into individual kingdoms (...)"* (Diogo, written account/2008).

In the perception of the teachers, individualism is linked to defensive behaviour, to mistrust and professional anxiety, as they told us:

> *"(...) mistrusting everything and everyone, it seems that there's always someone that wants to intrigue against us"* (Amélia, written account/2008)
> *"This kind of assessment does nothing to improve a teacher's performance, since it creates a great deal of anxiety in a teacher"* (Q. 56).

Through the complicated and constraining situation existing in schools today, individualism is seen not as a personal failing of the teacher, but as induced by the conditions in the workplace that requires an organisation of priorities:

> *"(...) will [the assessment model] conversely contribute to the emergence of a selfish and competitive professional culture that is demoralising and inspires insecurity?* (Carolina, written account/2008).
> *"(...) people shut themselves off a lot, spend a lot of time on themselves (...)"* (Catarina, oral account/2010).

Intensification of teacher work
The teachers taking part in this research feel that they are being seriously overloaded with tasks: they have more responsibilities, are more accountable and need to struggle with a wide range of skills in and out of the classroom; it is hard and affects the teaching role because far too many demands are made in school, as they told us:

> *"This change tried to place more responsibility on schools and teachers (...)"* (Elsa, written account/2008).
> *"(...) we've got so many things to run there, from behaviour (...)"* (Fátima, GD3).
> *"I feel that my job has been made harder (...)"* (Catarina, written account/2008).
> *"(...) my teaching work may be affected; there are so many demands (...)"* (Elsa, written account/2008).

Furthermore, teachers are forced to tackle administrative assessment tasks, and supervision and educational guidance in schools. They spend a great deal of time on guidance and/or attending meetings of all kinds – of teachers, year coordination, parents and guardians, management, school coordination, teacher assessment, not to mention informal meetings – leaving them little time for useful work in the classroom, or time for themselves (as a person and a professional) and their families, as our participants make clear:

> *"(...) teachers' activity is so taken up that most of the planning, support materials for classes, organisation of files, reports, preparation for meetings ... is done at home (...)"* (Gabriela, written account/2008).
> *(...) they really prejudice actual teaching because the teacher has countless parallel duties as well as teaching (...)"* (Manuel, GD1).

"(...) in addition to being, to having a class, I'm the establishment coordinator, too (...) and I'm feeling a bit lost at the moment, I'm not managing to reconcile the two jobs, establishment coordinator requires a lot from me (...) the class is suffering because I'm doing the other job (...)" (Catarina, oral account/2010).

So teachers see this job overload as a factor that hampers professional development, with adverse effects on the student teaching and learning process, and on professional identity.

Too much bureaucracy

Overall, the elementary school teachers find the reformulation of the Teaching Career Statute (TCS), especially the performance assessment model, to be a policy that has a negative impact on the their conceptions regarding their development, with particular emphasis on excessive bureaucracy, as Table 2 shows.

Table 3: Impact of recent legislation on professional development

Indicator	Positive	Negative	CST*
I've got too much red tape to sort out	**92.8**	7.2	182.2***
Schools/groupings suffer constant legislative attacks	**65.5**	34.5	23.8***
The teaching profession is being stripped of its character, and its main function forgotten	**83.5**	16.5	112.0***

* CST = Chi-Square Test

This discontent applies especially to the statement that schools/groupings are subjected to constant legislative attack (65.5%) and naturally leads to too much red tape in the school (92.8%), stripping the teaching profession of its character since its chief function is being forgotten: teaching.

The teachers think these education policies are inappropriate, lacking recognition from the authorities in charge of the groupings and the education community, and they also prevent good pedagogic practice in the classroom because of the inordinate amount of time spent discussion bureaucratic issues at the so-called pedagogic meetings.

"Unsuitable education policies, a lot of red tape and no recognition". (Q. 80)
"The more effort we make to try to improve the way we teach and to see that the students learn, the more we're criticised or observed". (Q. 146)
"The bureaucracy that's forced on schools at the moment means that teachers are asked to do far too much work". (Q. 7)
"Being a teacher is being a man of papers, red tape and abandoning the students". (Q.10)
 "(...) we're drowning in bureaucracy, that's not been mentioned yet here, loads of red tape, and then we go to meetings to deal with more of it, because information comes from the pedagogical council, goes to the meeting, information associated with the bureaucracy (...)" Moura, GD1).

Lack of professional motivation

At the conference on *Professional development of teachers*, organised during the Portuguese Presidency of the Council of the European Union, Canário (2007) underscored the importance of professionally motivating teachers as an alternative to fighting the increasing complexity of the profession, which corresponds (as we have been saying) to more papers, fresh demands and an expansion of the profile of its professional mission.

But when we asked the elementary school teachers if they felt motivated and satisfied in their daily work, given the policy implemented in their country, they said that the recent legislation (ECD and ADD) interfered negatively with their professional motivation (62.6%), impeded their professional development in school (95.5%), and so compromised the quality of their teaching performance in the school context.

Table 4: Lack of motivation for professional development

Indicator	Positive	Negative	CST*
Motivated	37.4	**62.6**	15.6***
Do you feel that the new Teaching Career Statute and performance assessment are encouraging your professional development?	4.5	**95.5**	204.0***

Note: *** p <0.001 ; CST = Chi-Square Test

The lack of motivation for profitable teacher development is basically due to the extra demands made of teachers in the workplace, the lack of recognition and comprehension of social contexts, particularly government responsibility, as the following observations by the teachers show:

"Given the situation with respect to current education policy, I think that what teachers actually do is not recognised, and is sometimes undervalued, which makes me feel discouraged and dissatisfied". (Q. 18)

"This situation causes teachers to feel discouraged, and this is inevitably reflected in their work." (Elsa, written account/2008).

"The climate of tension and discord in schools is such that it's become impossible to foster motivation and self-esteem (...)" Patrícia, written narrative/2008).

"At present, in professional terms, I feel discouraged, dissatisfied, because of the way society now sees teachers (...)" (Q. 141).

We believe that the latest changes and widespread criticism of teachers' work are the main reasons for the problems in the education system, and this has led to significant *teaching malaise* in schools. The teachers taking part in this study are clearly frustrated and tired, showing lack of motivation and inability (largely because of too little time and too much red tape) to meet all the demands made of them without jeopardising student learning.

"Teachers feel tired, disheartened (...)" (Catarina, written account/2008).

"(...) and it seems not, I end up disheartened and sometimes start to think: perhaps I won't bother with this, because it'll mean more paperwork, more papers, more papers (...)" Catarina, oral account /2010).

"Right now, thanks to the hours I work and the bureaucracy I have to deal with, I'm feeling more and more discouraged." (Q. 54).

This is what is happening in teaching at the moment, with all the damaging consequences this entails for teachers' professional development.

CONCLUSION

Faced with the need to respond to the greater complexity and incessant changes in today's society, teachers find themselves with the uncertainty of their professional roles being changed and having to adapt to new working contexts, in the name of new professionalism.

We can understand teachers' the present situation in school much better if we consider it in the school and social context in which they work, so that we may perceive the resurgence of cultures like individualism and the birth of others like professional competition.

In school, not only have teachers gradually got to the stage of being controlled by prescribed programmes and compulsory curriculum but they have seen their job become more intense and bureaucratic; they are required to respond immediately to the pressures and, above all, they have been conforming to multiple innovations in conditions that are all too often controversial.

Teachers see professional development as a route to gaining new knowledge and skills; but their experience in school suggests that there is no interest in motivating them to develop their teaching practice. Indeed, we can see the entrenchment of professional disenchantment that goes back to 2007, dragging with it the discredit of the profession and social disrespect, which affect the identity of the teacher.

In this context, the success of students is secured by teachers' personal attitudes – responsibility, diligence and interest – which, despite the social/professional complexity existing in schools today – lack of time, too much pressure, mistrust, unfairness, isolation – they believe that it is worthwhile to keep fighting for a better education.

97 - Research as a Regular Part of the Subject Didactics in the Teacher Education

Radka Wildová

Department of Primary Education, Faculty of Education, Charles University in Prague, Czech Republic
radka.wildova@pedf.cuni.cz

Abstract: The transition of primary education asks a general review of teacher education for teachers for primary schools. The improvement of the teacher training consists of different points, esp. actualization of the content of academic disciplines, improvement of educational practice and new methods of teaching of the academic disciplines (active learning, critical thinking, research activities etc.). The text will present the research possibilities of becoming teachers for primary schools and the impact of the results for improvement of the teaching at the faculties of education as well as at schools. As a part of the presentation the concrete project for improvement of reading literacy, as a result of one field research, will be presented.

Keywords: teacher training, primary schools, reading literacy, action research

INTRODUCTION

Teacher education in Czech Republic has been recently undergoing radical changes. The innovation of teacher development/preparation has become a major aim in the sense of professionalization. Current requirements are diametrically different from demands teachers were exposed to twenty years ago. Primary school teachers are expected to be real professionals in the area of education and their performance has to be multidimensional. Namely, teachers have to be experts in pedagogy, school management, subjects didactics, special pedagogy and, of course, even experts in various fields of our students' education. Creating new ways, setting up new demands in education and their evaluation are parts of professionalization in teacher development. That's all is facilitated by methods of education of future teachers and gradually and help them to become professionals in their profession.

The process of becoming a teacher is long-lasting and it doesn't end up by reaching magisterial degree in the programme Education for primary school teachers. Essential continuation of this phase of education is process of life-lasting education that provides further development, better orientation, challenges and offers answers to questions and problems in-service teachers have to deal with. Considering above mentioned facts education of teacher cannot be static process but a very dynamical development that is reflecting actual findings from explicit scientific disciplines, psychology of learners, social contexts and the others.

INNOVATION OF TEACHER TRAINING FOR PRIMARY SCHOOL - MODEL OF SUBJECT DIDACTICS

Teacher education in Czech Republic has been recently undergoing radical changes. The innovation of teacher development/preparation has become a major aim in the sense of professionalization. Current requirements are diametrically different from demands teachers were exposed to twenty years ago. Primary school teachers are expected to be real professionals in the area of education and their performance has to be multidimensional. Namely, teachers have to be experts in pedagogy, school management, subjects didactics, special pedagogy and, of course, even experts in various fields of our students' education. Creating new ways, setting up new demands in education and their evaluation are parts of professionalization in teacher development. That's all is facilitated by methods of education of future teachers and gradually and help them to become professionals in their profession.

The process of becoming a teacher is long-lasting and it doesn't end up by reaching magisterial degree in the programme Education for primary school teachers. Essential continuation of this phase of education is process of life-lasting education that provides further development, better orientation, challenges and offers answers to questions and problems in-service teachers have to deal with. Considering above mentioned facts education of teacher cannot be static process but a very dynamical development that is reflecting actual findings from explicit scientific disciplines, psychology of learners, social contexts and the others.

CONCRETE EXAMPLE OF THE MODEL DIDACTICS – "DIDACTICS OF INITIAL READING AND WRITING"

For the development of initial literacy, future teachers are being trained in the discipline of the Didactics of initial reading and writing, which the contemporary conception of the subject defines more broadly than before, i.e. as the didactics of the development of initial literacy, including not only reading and writing but also verbal expression. The change in the concept of these didactics is reflected specifically in the model of the transformation of subject-didactics which concretely means the change in its content, teaching methods and organization.

Change in the Contents of the Didactics Reading and Writing

Strengthening the educational-psychological element psychodidactics

In teacher training in general there is increasing emphasis on the integration of educational and psychological disciplines and the importance of the latter, The effective linking up of general didactics, general and developmental psychology and the Didactics of initial reading and writing is making possible the emergence of what is known as psychodidactics, which focuses on the development of educational psychological competence in future teachers (diagnostic, prognostic, interventional and communicational) rather than simply on their professional academic competence in a given subject.

Strengthening the importance of practical training

The contemporary concept of teacher training involves the perception of teaching practice asan essential part of training. The emphasis in the Didactics of initial reading and writing is placed on integrating practice of a progressively more demanding kind into the whole course given to workshops, seminars and directed discussion to encourage the activity and creativity of the student.

Use of reflection and self-reflection in Practical Training

One of the most important methods of developing teaching skills in the future teacher is to make use of the students own reactions, views and self assessment in individual phases of teaching practice in the Didactics of initial reading and writing. Student reflection and self-reflection is based first on his or her observation of the outputs of the teacher, then on various forms of practice as an assistant, and linally on the student's own experiments in teaching. Through reflection on practice and self-assessment the student's competence as a teacher develops; he or she becomes aware of the problems of specific teaching situations, learns howto solve them, and draws conclusions for his or her personal development.

Changes in the Organisation of the Didactics of initial reading and writing

Modular Organisation

Change in content and teaching methods brings with it the need for change in the organization of the Didactics of initial reading and writing. Modular organisation, in which each module represents a particular area in teacher training, is proving highly effective.

At the CU Faculty of Education, the Didactics of initial reading and writing are included in the Educational-Psychological module and students may take it only after completing General Didactics and Practical Teaching. This condition ensures that the knowledge and skill acquired in General Didactics can be applied in the subject.

Efective Integration of Theoretical and Practical Elements

It has already been stated that the effective training of teachers required systematic integration of the theoretical and practical elements. In the context of the Didactics of initial reading and writing, content integrations is encouraged by an organisational structure that links up a seminar series and practices in one bloc, which is conducted directly in a primary school. The advantage here is the opportunity to undertake practical work at any time in the course of the teaching bloc, to use the experience of the teacher in assessing and discussion practice, and to use the chance of working with primary-school pupils within the time-frame of the seminars. Although this kind of organisation is extremely complicated and demanding, it is proving so effective that there is no doubt that such close co-operation between subject didactics, the teacher, the primary-school pupils and the students of the faculty, is beneficial for all concemed.

<u>Flexibility and Individualisation</u>

One common trend in change in teacher training is toward a flexibility in study programmes that respects the individual personal development of each student. In the Didactics of initial reading and writing this flexibility and individualisation affects not only the length of studies and the choice of disciplines in individual study trajectories, the choice of school and teacher for teaching practice, and the choice of final output for completion of subject disciplines (theoretical, research or methodological-didactic work submitted at end of year), but also the choice of lecturer; content and method of work (in the form of advanced courses).

RESEARCH AS THE METHOD IN SUBJECT DIDACTICS

One of the current European trends in the transformation of the training of teachers is including research into the subject - didactic training. The reason is above all the fact that it is research which makes it possible to monitor the quality of education by way of observing the individual development of a pupil or of a group of pupils, while at the same time the obtained results offer specific didactic application. On the other hand, however, it turns out that a number of teachers do not make use of action research as specified above, and if they do, it is mostly at random and without any link to the subsequent activities, which support the further optimum development of the pupils. In the model, which we present here, research is one of the substantial methods, which helps the student to develop a didactic competence of his own.

To sum up the importance of research, it may be said that research as a component part of subject didactics fulfills two basic functions:

It is through research that students learn to formulate a research hypothesis on the basis of theoretical and practical knowledge and skills, acquire the skill to organise research methodologically and to evaluate it according to specified hypotheses. They use the results to formulate conclusions, on whose basis they formulate specific recommendations for practice, which they also try to implement. But through research students acquire not only the experience with the application of the individual research techniques for monitoring a specific pedagogical phenomenon, they also develop the skill to reflect on research at all its phases - starting with the formulation of a hypothesis and finishing with the formulation of are commendation for practice on the basis of the respective conclusions.

In subject didactics research concentrates on the monitoring of a specific pedagogical phenomenon (e.g. individual development of pupils in a certain educational sphere) and it is this monitoring which makes it possible for students to acquire a deeper insight into a specific pedagogical process, whose reflection and self-reflection is utilised by students in the development of their own competence (diagnostics and subsequent individual work with the pupils).

Making use of research activities brings a new dimension into the process of the training of teachers. Students are not only 'recipients' of generally valid or anticipated conclusions. They become 'researchers', i.e. persons through whom research helps to find answers to independently formulated hypotheses resulting from current didactic problems. Students learn to look for these problems, to construct research projects to monitor them, and then to evaluate the achieved conclusions and utilise them further in their teachers' education. In teachers' education these independent activities of their own are extremely valuable, because students are in a close contact with pedagogical practice and make a maximum use of and verify in practice the acquired knowledge, skills and abilities, which are needed for the preparation, organisation and evaluation of' research activities.

It is obvious that making use of research as a method used in training of future teachers is very demandig also for a concrete subject didactics specialist, who is the closest collaborator of students in this process. Besides introducing a close co-operation of school practice, which will also make it possible to implement the feedbacks (results of research, remedial measures, etc.), an indispensable prerequisite of an effective utilisation of research is also the incorporation of research into the program of seminars of specific subject didactics (at the seminars, students have the possibility to hold regular discussions on the problems of their own research activities).

To provide a concrete idea we can give a concrete example of the utilisation of research in subject didactics - the Didactics of development of initial reading literacy, which is one of the didactics innovated according to the presented model. In the Didactics of initial reading and writing students prepare their own research projects, or they can choose from several offered joint research projects, which are prepared in such a way that they make it possible for students to achieve a certain variability and individualisation. Most students prefer all-year-round research projects, whose target is above all analysing the present situation in the development of the initial reading and writing in present-day primary school. In these research projects the process of development of the specified skills and attitudes is analysed in detail with the individual pupils

including the factors influencing this process. An important component part is also a long-term monitoring of didactic procedures of the teacher, co-operation of parents and of other subjects. Students have the possibility to participate voluntarily in all the phases of research projects. The conclusions of research projects are regularly discussed as a part of didactic training and utilised for the development of individual didactic competence of students, but also for the development of didactics as a research specialisation.

One of the "joint" research projects is specified below as a concrete example: "Development of initial reading literacy in present-day Czech primary school".

General target:
Analysing the process of development of initial reading literacy with pupils of the first forms of elementary schools

Partial targets:
Analysing the process of development of initial reading with the individual groups of pupils (various methods of teaching of initial reading size are dislocation of schools, educational programme etc.)
Determining the factors, which influence the process of development of initial reading
Analysis of the didactic work of teachers and determining, who teaches in the first forms
Formulation of recommendations for the practice of school education and for the development of the respective didactics

Investigated sample of pupils:
Pupils of the first forms of Czech primary schools of various sizes, dislocations, manners of organisation, educational programmes etc.

Research methods:
Standardised and non-standardised examinations determining pre-school state of preparation for the teaching of reading development of initial reading in the course of the first form on the basis of simple characteristics of the reading output, determining the level of reading ability of the pupils, controlled observation of the teaching process according to criteria determined in advance, controlled discussions with teachers and pupils.

Organisation of research investigation:
Entrance (September), continuous (January), exit (May) exams. In the course of the school year, besides these examinations students perform controlled observations aimed at monitoring the methodic and didactic work of teachers and the individual development of pupils.

Evaluation of research, conclusions:
Evaluation of research is prepared by students jointly with the respective subject didactics specialist. They formulate the conclusions and recommendations for practice of schools and for training of teachers. These conclusions and recommendations are presented to all students studying the respective discipline and at the same time they are also offered to the participating teachers at schools. On the basis of the results of diagnostic exams and observations, students prepare and implement the individual developing programmes for pupils, and they do so jointly with their teachers.

CONCLUSION
Using research in teacher education is very important for future professionalization of novice teachers in all different areas of their theoretical and practical training. Future teachers meet with both theoretical and practical problems and they can suggest/design research projects. These projects than become parts of their subject didactics and formulate conclusions accordingly to different target groups. The research projects have positive impact event on actual teaching practice. Finally, students together with their teachers can design or suggest and make real practical changes in order to improve described situation.

Abstract: The article aims to present and share thoughts on an educational research on the topic: "Memories of being a teacher in training" It aimed to recover the records, the memories that have been woven in the constitution of becoming a teacher of students from the Preparatory Course to became a teacher, in its initial formation. It also proposes to understand the complex world of school culture that includes the training of future professionals, articulated discussions of educational quality and the need of building pedagogical alternatives for the first years of basic education, taking into consideration the continuities and changes in teaching careers. The research has been developed since the year 2008, with an average of sixty young from the Training Course for Teachers, from 1st to 4th year of the Preparatory Course of João Pessoa State School located in the municipality of Campos de Goytacazes, Rio de Janeiro, Brazil.

Keywords: Memory - Teacher Training - Culture - Youth school-narratives of self.

INTRODUCTION

Being a teacher today is to live intensely, his time with awareness and sensitivity. One can't imagine a future for humanity without educators. Educators, an emancipating vision, not only transform information into knowledge and critical awareness, but also train people. They do know the flow - not given the information, the pure knowledge - meaning they build into the lives of people and for humanity and seek together a fairer, more productive and healthy for everyone. Therefore, they are essential (Gadotti, 2007, p.22).

A title that reflects how we perceive we are presenting today the challenge of being an educator, as it involves going beyond the parameters that have forged us to embrace new / old theories and practices that are committed to training future teachers in search of questions and answers that nourish reason and human sensitivity.

This work brings an institutional effort to monitor and record the trajectory of young students in a teacher training course for the beginning of the normal school, in Campos, Rio de Janeiro, Brazil. In an attempt to understand the universe constructed memories of school culture as an area of social and educational practices that are developed, since the year 2008, a survey involving sixty young people in this public institution, claiming: 1) identify, interpret and describe the dialogues about experiences and memories of the school, through the space created what we call Creation Workshops, 2) question the policies for the training of teachers in High School Normal, considering the expectations of these young students in relation to teaching and further education.

This investigation relates to the context of the guidelines for teacher training, and especially with respect to reflections about "the pressure for the professionalization of youth after the school, which puts a huge contingent of young people in the teaching profession and finding professionalization " (Freitas, 2009, p. 86). Thus acquires new importance of the research carried out we ask about the kind of intellectual and cultural experience that the young trainee teachers, coming from the poorest are given the opportunity to experience.

According to Sposito (2007), would be structured with some level of significant relationships for new learning or training institutions have offered only one accreditation, whose only important reference becomes a vague memory of a teacher who knew how to interact more intense with the students, strengthening their personal and professional development?These and other questions guided the study.

CONSIDERATIONS ON THE PATHS TRODDEN BY ESTADUAL JOÃO PESSOA HIGH SCHOOL

To conduct this research, the University of North Fluminense "Darcy", through research projects of Undergraduate Research and Extension, has partnered with the State College "John Person," in order to develop research activities in the field of teacher education. The college is located in the city of Goytacazes and is characterized by having maintained a continuous process of struggle for many years to ensure a proper space in the city. This process of cohesion within and outside the school required some sedimentation about values and attitudes that were recorded at different times in the Proceedings school. With this, the Training Course was earning the respect of the school community, focusing on a symbolic structure built on a particular culture and tradition.

When the training course for teachers was abolished, to meet the demands of the new Law of Directives and Bases of National Education, number 9394, the year 1996, attempts by the reaffirmation of its recognition and permanence were taken, discussing the contributions of school in youth training.

Thus, a set of propositions was developed by school teachers, for the return stroke.In 2005 and 2006, gathered documents to justify, with the Education Department of Rio de Janeiro, the appropriateness of continued progress for the community. Upon approval for its operation, there was demand for the poorest youth, who sought a better qualification for the job, surprising the increasing enrollments in education institution surveyed.

This has been the reality we face through the various research projects that propose to promote the College.

To broaden our understanding, just remember that, throughout the State of Rio de Janeiro, according to Coordinator of Vocational High School, teacher's course mode, are in operation ninety-six school units, including four located in the City of Rio de Janeiro.

LEGAL FRAMEWORKS: GUIDELINES FOR YOUTH TRAINING IN THE TRAINING COURSE FOR TEACHERS

With respect to legal measures to expand the proposal to the Normal School, many actions are required.To monitor the operation, we consulted the opinion number 122, November 10, 2009, SEEDUC Resolution (State Department of Education of Rio de Janeiro) number 4376 of December 18, 2009, and Ordinance SEEDUC number 91, March 29, 2010.

Listed below, some points that deserve attention on these legal provisions for the training of teachers in secondary education, teacher training mode, which represent a controversial issue. This is because the resolution of the CNE / CEB n.1, 20/08/2003, according to Brezezinski (2008), provides for the rights of education professionals trained mid-level, being an instrument that reaffirms and supplements the prescribed in art. 62 of the Law of Directives and Bases, admitting "as formal education for the practice of teaching in kindergarten and the first four grades of elementary school, offered at the secondary level, the mode teacher training" (p.123). Although the author argues that, from the perspective of personal, nontransferable right, the resolution represents progress, considering that protects, for life, the right-graduated student in high school vocational course. From the perspective of the movement that advocates the training of teachers in higher grades of education, the resolution represents a step backwards. This level of training serves as an obstacle to the search, the young, the Faculty of Education.

Given this analysis, we are interested in deepening the aspirations of youth who choose this professional course, to grasp the meaning of professionalization. To do this, it is necessary to refer to elements that determine education policies, among them the historical conditions of its production, the correlation of forces involved and the theoretical perspectives shared.

Referring to Resolution number 4376 SEEDUC of 18/12/2009, we found that the body of the text is mentioned for consideration and approval of the adequacy of NCM Course for schools in the State Public Education Network, with an emphasis in Early Childhood Education in Education for the early years of primary education, special education in the context of the Inclusive Education and Education for Youth and Adults.

This resolution also informs that the curriculum submitted is the work of the Center established in 2008 at schools, and that during the meetings were discussed issues facing the professional teacher training, trends in the field of training of teachers, curriculum organization, the basic national policy, the diversified part of the practice while training space. These changes, introduced after 2008, would require a full-time workday working with a workload of 5,200 hours (50 minute class) distributed in three series of the course.

The school investigated in the city of Goytacazes in 2008 and 2009 worked with another NCM totaling four years of training, starting the internship in the second year and the workday was part time. Even the

institution went through reforms initiated in 2003 that were only completed in 2009, the year he was graduated the first class. No labs, library and playroom, the lack of resources was apparent.

The students, Undergraduate Research Fellows of the University of North Fluminense "Darcy Ribeiro, who participated in the study, questioned the problems observed. Thus, many challenging questions remain to be overcome by teachers and administrators: for example, the new organization proposed by the Resolution and Ordinance on the integration between the areas, since the teachers meet double shifts, also teaching in private schools.

Remember, the college's Educational Policy Project were based on the diversification of learning environments in line with the grade designated as Pedagogical Practice / Start / Pedagogical Laboratories.These laboratories would consist of Toy Library, Art, Practice Psychometric Languages and Literacies, Educational Assistance, Life and Nature, among others, that should be developed at schools.

The dynamics of research carried out revealed that lack of physical infrastructure for the implementation of these laboratories, the lack of professional training for development represent some of the concerns of management and teachers who worked at the institution studied.

Turning back to the current legislation, we note that in Art 8 of Resolution 4376 shows that the enrollment of students from high school, graduating or transferred, should occur in the first year, considering the specifics of the training course. This change, as some managers interviewed argued, could lessen the demand for teacher training in high school.

THE EMERGENCE OF TRAINING YOUNG STUDENTS AND THE SCHOOL CULTURE EXPRESSED IN THE CREATION WORKSHOPS

Returning to the design goals, we emphasize that the text intended, through the investigation, identify, interpret and describe the conversations about the experiences and school experiences, the contributions of the school opposite the mid-level training, the expectations of these young students about and to work on their projects of life and future. Moreover, it is proposed to understand the complex world of school culture that includes the formation of future professional, articulate discussions of educational quality and the need to build pedagogical alternatives for the first years of basic education, in view of the continuities and changes in teaching career.

In this scenario, we construct a space that we call creative workshops, which took place at weekly meetings. Initially, in the State College area's own "John Person", and from the second half of 2008, for reasons of work in school, are held at the Universidade Estadual do Norte Fluminense "Darcy Ribeiro", totaling an average of sixty hours activities.

We chose the qualitative research approach, seeking to prioritize the dynamic / complex / subjective nature of human nature, which made us look in experiential meetings, facilitate the listening space attentive participants' (Luck & Andrew, 1988).

As the workshops were aimed at creating meaningful experiences creating opportunity, we take the category Experience as one that enables one to know through the experience of all the parties. A life may favor targeting the meetings with potential, considering being in its multiple forms of expression. An experience or a learning experience enable a circular, favoring the inclusion of the subject in the globalization of its internalization / externalization, providing you aware of the whole, through action, or a notice in action.

At this point, we have included considerations of Larrosa (2002), in order to expand the idea of experience. He points out that experience in Spanish, is "what goes on," in Portuguese, experience is "what happens to us." So it may be what we pass, what happens to us and what touches us.

Thus, through workshops, expanded and qualify the visual and poetic language that, intertwine, allowed each participant to experience aesthetically its formation process, bringing the memories of themselves in their own training as a student. The proposals were often the individual to the collective, and other times of the collective to the individual, using diverse materials and always creating opportunities for the use of spoken and written word.

With this perspective, many stories have been woven, making room for imagination. Drawings, clay sculptures, sculptures with clay, paper dolls came on the scene and, collectively, in the alchemical process, turned into creative stories that dazzled the moment (the) authors (as), the moment (as) were thrilled with the memories!

These records were made in her diary, everyday kind of field, which was creatively constructed by each.We found, through creative writing, as each student (a) throughout the process, would build the capacity to reflect on their own training, which Souza (2007) states:

The process of reflective writing allows the subject to produce a knowledge of oneself, others and about their daily lives, which enhances the contact with their uniqueness and reflection about their identity.It is therefore the process of training and knowledge based on experiences of the subject (p.76).

It was found that there was an expectation of young people who participated in the research that would improve personal life from education.Although aware of the precariousness of public schools, one realizes that there are wide variations about the chances of continuing their studies or the possibilities of acting as professional educators.

Memories of school culture you experienced interruptions to ensure family survival have been revealed in the structured interviews and creative workshops. These records will be shared in this text, aimed at questioning the quality of education, beyond the possibility of reviewing the testimony of the young about the importance of having access to school. About this issue was concluded that, although they felt that access to schools was low, yet the (as) felt certain young to walk on trails uncertain.

Along the way, was prompted by significant educational activities, which mainly students, future teachers, could express past and present during the workshops, with encouraging you to deal with their perceptions, their values, their knowledge and their own languages, so giving new meaning to learning for teacher training.

In the excavation of memories, they were unveiling the pace and organization of school experiences in elementary school, where the content displayed by teachers demanding activities with reading instructions such as: the exercises, research on various topics, group work, which ends with carrying out tests to check learning.

These experiences showed that this pedagogical framework could not always be met by many of these young people, who could afford to purchase school supplies.

On this issue, Mogarro (2005) admits that the school culture has a deep nature and natural history. It consists of a set of theories, principles and ideals, norms, rules, rituals, routines, habits and practices that are related to ways of thinking and doing behaviors sedimented over time, presenting themselves as traditions, rules and regularities shared by educational actors within the institutions.

The production of this culture and its understanding requires not only a work of preparing and looking for sources, but also, according to Felgueiras (2005), gathering together the people, of memories that are permeated with symbolizations and assume the dynamic processes of conflict and change.

In the space of narration itself, it became clear that many questions are posed for reflection on the specificity of "being a teacher," such as the experiences and school experiences involving teaching and learning, the ability to study, depending on family income and relations between study and job prospects. All this was to be experienced by the ability to access memories, individual and collective reflections related to pedagogical practice witnessed by young students.

Heading toward the motto, in interviews and workshops, we captured:

> I enrolled in the course of encouragement from my mother and was initially not very motivated today and with the stages and the support of some teachers, I think that I'll get a university and to teach in a private school or public (student 18 years /2008).

And what memories / memories about the school and on the educative experiences expressive brought to the meetings? How was your doing and inventing ways to make themselves through writing?

> My childhood was very happy, everything was colorful. I remembered when my mother took me to school. It was great to see my friends, play dough, for apron to make paintings. In the experience was all so magical I got to smell the chocolate.
> I remembered when I was a little girl who was studying at the nursery. Reminded of many colors, music, chocolate. I remembered the nursery and children had to sleep all afternoon, but I could not preach his eyes.
> My mom took my sister and me to the nursery. When we got there my sister opened her mouth to cry.
> My childhood was very fun. I learned a lot. I remember the smell of cornmeal cake that my grandmother loved to do. I remember my teachers at school, my paintings in the book
> (Diary, March 2008).

The opportunity to recover memories, record them or express them visually through images, is one possible path can lead to a reflection on the process itself to learn and live the aesthetic experience, since light doing, what Chamlian (2008) signals:

> The autobiographical narrative lets bring to light the difficulties and weaknesses, but also the capabilities and qualities, choices that may have settled, and to strengthen them.Allows, especially to understand the process of learning and involvement in the acceptance of stereotypes of theoretical explanations for learning (p.136).

In this sense we bring Vygotsky (1988, 2001, 2003 a, 2003b, 2003c) that theorizes language as it develops the subject, stressing that the creative expressions of the subject, potentiate the language as an instrument of thought. States that when the individual appropriates the culture and language, it organizes itself, since both the language and culture are dynamic, moving and have not crystallize.

Dominicé (1990) believes that the formation of youth and adults does not occur only through an educational action, but is the result of a life trajectory and reflection on the way adults have appropriated a particular time and space education.

We can interpret that from these studies, "the life stories, focusing on training, relate to the territories, and how the whole are generally related to issues of belonging and, therefore, issues of identity that at the heart of the stories, as in contemporary autobiographies" (Joss, 2008, p. 23).

It was in search of those territories themselves, the research evolved, materializing the possibilities, that through the use of language forms liberating and thoughtful, future teachers find their own means to access their memories and stories of themselves.

The personal accounts that are engaged in the course students present themselves as invested with commonly shared representations in the registration of acquisitions of new skills and search for the professorship. We made records: "To be a competent teacher you must have a vocation, profession love, love children and this is born with us." (Registration done in the "Diary" on November 19, 2008). "There is no investment in the career of the teacher, so who does the same teaching has to give much love children. Doing the work of teaching with caring for improving education to enhance the teachers who is very underrated today" (Registration done in the "Diary" on November 19, 2008).

With these records, we can observe the naturalization of the meaning of teaching, demonstrating the priority the production of practical knowledge. The call, according to Bruschini (1981), is associated with the idea that people have natural gifts and a predisposition to perform certain occupations, being one of the most effective mechanisms to induce women to choose occupations that are less socially valued.

Thus, some myths attached why the Magisterium have the female predominance, and highlighted in the workshops, the debate about the actual conditions and the devaluation of professional achievement in many ways: economic, social and cultural.

Listen to what these young girls know about themselves can be a way to value them and to contribute to the debate mentioned on the professionalization of teachers, explaining the various angles of the issue. According to Arroyo (2007), there are many ways in which students talk about their lives, their careers and humanities students, and these "words" can give voice to those who have long been silenced.

ENDNOTES: POINTING OUT SOME CONCLUSIONS

Recovering the history of women in teaching is crucial, at the time the debate about the teaching profession has been enhanced through the revitalization movement of training courses in which they question the pedagogical and knowledge involved in the training process.

Given these specificities, Roland (2007) discusses the specificity of the teaching profession, questioning the criteria of the transmission of theoretical knowledge as a key function of the act of teaching. For the author, in light of new research tools that promote the availability and the democratization of information, the teacher should take, above all, the role of mediator of knowledge.

Through the testimonies, we try to develop some analysis that have been outlined as a product of reading, among others, even if preliminary and to be built. So we try to discuss the precarious occupational positions among young people opting for the course, the familiar stimuli for further study, especially the mothers' participation in this process, expectations about work, motivation and progress in studies by teaching career.

Dayrell (2009), to analyze the school as a social and cultural points out the need to understand it through the lens of culture, which takes into account to understand the daily life, reviving the role of these young people in the social context, considering a set of standards and rules that appear mediated by ownership, development or revulsion expressed in established relationships (p.137).

For the author "who are these girls? What will get in school? "Based on these questions, it was to make an analytical approach and the survey data, found that 18% of young students came to complete the regular high school, and returned to school with expectations of school experience, with the intent of achieving better working conditions. A more focused look at the relationship between school and youth shows that 32% consider the imposition of interest for their training. It also highlighted the belief in personal and professional development through education, in the testimonies of 52% of young people who participated in the survey. Grievances about the school history are explained not only by the shortcomings of the course, but also were justified by the school career interrupted by material shortages and deficiencies in levels of education prior to high school. For Gatti (2009), one should take into account that the choice of teaching is often presented as an alternative if there is no possibility to exercise another activity.

Another point that attracted our attention, and which was registered in Abramo (2008), the reference population is familiar, though the mothers heard more participatory and the recognition of the investment that must be done through education. In general, it confirms the research done with young people by other researchers as being the education of youth for this layer, a question of your personal sphere, discussing it in that context, with family members, as a matter of sphere public, that should be examined by society.

While 12% of a stand about the precariousness of the institution and teaching, it was perceived as distancing to questions raised about the lack of resources, crowded classes, as nearly 30% emphasized the vocation for the profession as one of the key points confronting the educational problems. Also, the students reported that they believe they have a vocation for teaching, defined as "very fond of children, they take way to be a teacher who believes he can with love and passion for what you do make school more fun and dynamic" (graduating student in 2009).

In this sense, the priority is to develop more studies in the area of teacher training in order to evaluate the activities and propose new training programs. One route might be to take into account the perceptions of students in training and their representations of their lives, or how are built and how they view their careers.

Abstract: This article has been elaborated as an intervention research; having collaborative nature, it presents and analyses partial data taken from an ongoing research made in a primary school, from a city in the west of São Paulo State, Brazil. It aims to build knowledge on the process of teachers' professional development and primary school educators at work environment; to make interventions in the school environment, to provide actions for knowledge construction and reconstruction involving all participants; moreover, consolidate a research group which contemplates the participation of all subjects engaged in this process. The first conclusions show teachers' expectation toward the researches looking forward ready answers to help them in the school challenges; they indicate the inclusion of researches in a school environment is a process which demands permanent negotiation, also, that the most pressing difficulties are related to educational policies´ implementation processes.

Keywords: professional development, teacher's education, teachers' trainers

INTRODUCTION

The present article brings in and analyses partial data obtained by an ongoing research[1], which is being carried out together with a primary school situated in medium size city, in the west of Sao Paulo State, in Brazil.

In general words, the project involves nine researches working in two universities[2] from São Paulo State and twenty seven professionals who work for the partner school, they are: the director, the vice-director, the educational advisor, the person in charge of the library, the teachers and the children development assistants.

The project as a whole has triple characteristic: build knowledge on the process of teachers' professional development and primary school educators in their work environment; get involved in the school surroundings where those processes take place, in a way to provide actions capable of stimulating the construction/reconstruction of knowledge with the participants' collaboration - researches and professionals from the school – who are able to contribute to enhancement in teaching and professional learning of teachers; and; simultaneously, promote the consolidation of a study group which involves the researches, the undergraduate and postgraduate students in both universities involved, in addition to the school staff.

More specifically, the objectives of the research are: produce knowledge about teachers' professional development processes and educators in their work place, considering it beyond its training praxis, linked to aspects which are not formative, but, the ones related to the professionals of this career; come up with specific and pedagogic knowledge (related to the teaching and learning processes and the educational reality the school faces regarding school failure), thinking of possible actions to be developed through collaborative work; incite professional development by making the subjects of the study reflect upon their teaching practice, based on a constructive and collaborative pattern focused on school, in a way they can examine their implicit theories, their practice, their attitude, etc. in order to keep a permanent self-assessment which can provide some guidance for their job; establish a partnership between the university and the school, recognising them as knowledge producers, capable to convert this study into mutual benefits (investigative and formative) and, specially, achieve long lasting results in the school which keep on acting even after the researches have left, causing impacts, in medium-term, to the teaching and learning processes offered and developed by the school and to the participants' professional development; promoting and evaluation of the formative and investigative strategies applied.

Concerning the methodological aspects, this study can be described as an intervention-research of collaborative nature. This is a kind of investigation that requires the development of several procedures which provide a process of partnership and mutual learning (Cole & Knowles, 1993) among the involved people (school and university staff). This perspective includes a systematic investigation about the

consequences caused by the works done in the sense of changing the social relations in the investigated community's context (Aldena, 1989). It means that, at the same time answers to the investigation's questions are being searched, intervention actions are being developed to facilitate the establishment of strategies to have the initial questions answered, meanwhile other questions may arise, that is a continuous and non-linear process which makes possible the continuing qualification of teachers and educators in the school context.

The collaborative research can be understood, in general lines, as a component of an articulated dialogue between the researches and the school staff, it's aimed at investigation and construction of new knowledge, besides looking for solutions to the concrete problems the school faces daily. This type of investigation considers the different roles taken by the pairs (teachers, teacher's trainers and researchers), recognising that this is a multi-faceted relationship and not a hierarchical one. Due to its collaborative nature, Imbernón (2010) assures that this sort of research is favorable to professional development, because teachers can benefit from the continuing qualification which best fits to their professional needs in the educational context they're inserted. Teachers can be recognised as social agents, able to plan, manage and modify the teaching and learning process, furthermore, they can intervene in the complex systems which constitute the social and professional structure.

Given the space available for this text, and considering the fact that the search is still under development, it's surely impossible to end the considerations about this experience, that's due to the multiple elements which may emerge throughout the process. Because of that, the present article intends to present and analyse partial results obtained by the investigation, more specifically, look forward to answer the following questions: In which context is the school inserted and what is the professional profile of teachers working in there? What`s the meaning attributed by the school staff to professional education? Which expectations do teachers have concerning the partnership university-school?

Aiming to answer the research's general questions and taking into account the peculiarity a process involving an intervention research of collaborative nature, we have initially looked for the school staff's personal views, for that purpose, activities which could make easy the coming out of their knowledge and beliefs were used. In a more specific way, a study and an analysis about the school planning (2010-2012) was made, collective meetings in school environment, in which all the people involved in the research participated, were held, also, a questionnaire was applied to them so that an initial diagnostic could be obtained to enable the researches to understand how the school staff being examined conceives that work environment, the subjects acting in it, their role in that space and identify the expectations concerning the establishment of the partnership university-school; those actions taken bearing in mind the minimization of school failure in the first years of primary education.

It's important to say that a study made about what people usually know comes from an analysis about what they say they know (Freeman, 2000).

This way, words are taken as a vehicle for thought representation and the people "are considered about what they say". In this study the representational reading was adopted as the analysis perspective about what the school staff (teachers and teacher's trainers) said about the community in which the school is set into, it's work context, it's students, it's role in that context and the managing staff's role (director, vice-director and educational advisor), its perspectives, worries, assuming that the words can represent their thoughts, beliefs, knowledge and feelings.

TEACHER'S EDUCATION AND STUDENTS' LEARNING: SOME CONSIDERATIONS

It's known that the society as whole, in a more emphatic way in the last years, claims the teaching quality is improved, which results in fundamental changes about what the students learn and how they should be taught. The perspective is that the students present compatible performance to the guidelines established for the States (*School Evaluation and Performance System* –SARESP), for the country (*Primary school evaluation system* – SAEB) and for the world (*Programme for International Student Assessment* - PISA). As indicated previously, it's emphasized that they are able to understand the school content; think critically; create and solve problems; summarize information and express themselves with proficiency. When it comes to international external evaluations, PISA is applied each three years by OCDE (Organization for Cooperation and Economical Development) with the objective of producing indicators that promote the discussion about primary education quality, as well as, the proposition of public policies aimed at improving this teaching level. The exam measures the educational performance of 15-year-old students, based on Reading, Math and Science tests; it's applied to the thirty-two countries integrating the OCDE and invited countries, which is Brazil's situation. The tests have been applied each three years since 2000. The fourth cycle of evaluation from this program was completed in 2009. Taking as an example, the reading

competence throughout PISA's four editions, Brazil was in the last positions of the ranking among the countries evaluated. It was placed in level "1a"of the Reading proficiency scale, being the higher level 6.

This information reveals the low Brazilian Education quality and the difficulty to change this situation, considering that, throughout a decade, the country hasn't shown relevant and consistent advances regarding the students' reading competence.

When we think about the process of external evaluation in the national context, SAEB, which had its name changed in 2005 to ANEB (National Primary Education Evaluation), appears as a first initiative with the intention of establishing a diagnostics of the country's educational system. In a publication titled *'SAEB 2005 – Primeiros resultados: Médias de desempenho do SAEB/2005 em perspectiva comparada'* (MEC/INEP, 2007), It's highlighted a historical series of results through which it's possible to follow the performance achieved by the students from 1995 to 2005. In a proficiency scale in which '250' is the expected average for the students finishing the 8th grade (the last year of cycle II called 'Ensino Fundamental[33]' in Brazil) in the Portuguese test, it can be observed that the grade obtained by students decreased from 256.1 to 1995 to 231.9 in 2005 (Op cit, p.6). It's worth mentioning that SAEB's proficiency scale for Portuguese varies from 0 to 500. Those results show that students which conclude the first eight years of school in Brazil, considering the national average, haven't achieved a desirable grade, in other words, they can't read text relatively long or complex in Portuguese.

Concerning SARESP of 2007, which is the evaluation the State applies, the exam's final result have shown that 23.8% from 4th grade students were below the level considered basic for this grade in the writing test. SARESP's writing scale is divided in four levels: below basic (the student has difficulty to write a text according to the instructions given), basic (the student does the activity reasonably), adequate (the student executes text production well) and advanced (the student accomplishes the task given very well).

On the other hand, in 2009, 10.1% of the students evaluated were classified in the basic level, while, 40.4% of them reached the advanced level. Even though the results obtained n 2009 show an improvement in the indicators comparing to 2007, the high number of students which conclude this initial teaching in a level below the expected, keep on being a matter of concerning.

Facing this new perspective, the teachers are now the on the spot of the educational changes, they have the responsibility of conducting students through this duty, besides doing their job in order to attend the educational demands delineated.

In the last years, the idea that good teaching is more complex than the way it was thought to be at the beginning, is getting stronger. Teaching, each time more, has been recognized as a "complex knowledge mixture that encloses specific and pedagogic content, abilities to teach various students, and, the knowledge and understanding about the context where the teaching takes places" (Tatto, 1993, p. 87), opposing to the idea that anyone can teach. This new way of conceiving the teaching has resulted in a deep change of knowledge, abilities and dispositions teachers should have.

Besides seeing the teacher as a professional, the research in the educational area points to the importance of investigation its role in the delineation and implementation of public policies, also for defining the necessary knowledge to a well succeeded teaching.

Frequently it's possible to observe that policies are formulated by specialized groups which are not familiar with the educational system's structure, especially with the school culture, or the teachers' participation is just bureaucratic, usually they are required for less important roles, though they are expected to act as protagonists. The policies' implementation occur through decrees and the teachers are conceived as passive agents in this process, that can generate resistance and negative behavior towards the changes suggested, or even worse, a discourse to be assumed, without following the transformations prescribed. For that reason this process is many times conflicting and dilemmatic, its effects originate from the interaction established between the teachers and several limiting factors, for example, the definition of unreal levels of requirements. In this sense, a political discourse, heavily influenced by ideology is used, however, it's distant from the daily problems the school has, what, in this case, creates more anxiety than stimulates actions to be taken by the teachers (Oyafuso & Maia, 2004).

A study published by the Program for Promoting Educational Reforms in Latin America (PREAL, 2006), reports the results of global performance exams taken by students, in which Latin America has had the lowest results among the evaluated countries.

---

[33] Brazilian Mandatory Educational System is divided into 'Children Education, which is aimed at 0 to 3 year-old-children; Preschool 4 to 5-year old children; 'Ensino Fundamental' which is divided into cycle I, 1th to 5th year and cycle II 6th to 9th year and it's aimed at children from 6 to 14 years old.

[...] Though the sincere and impressive efforts, most of the schools keep on failing when it comes to giving the children the necessary abilities and competences to achieve their personal and economic success, besides the practice of citizenship. […] In the key-measure of success (quality, equality and efficiency) the levels continue low and the advances are little or almost non-existing. Low learning level, lack of systems based on performance, not much responsibility and the teaching crisis conspire in the sense of preventing the majority of Latin-American children from knowledge and necessary abilities to have progress in the modern societies.

These indicators cannot be taken into account as a ´straitjacket´, which reflects the current school reality in its total form, although they point to important aspects of the Education System which should be considered and evaluated by public policies, specially the following aspects: equity, quality and teacher's education, which are stuck in a bad standard.

It's seen in countries as Brazil, Mexico and Uruguay that 15-year-old teenagers got grades close to the minimum expected in Reading, Math and Sciences. [...] Almost half of Latin America students have shown serious difficulties in using the reading to amplify their knowledge and abilities and most of them (3/4 in Brazil; 2/3 in Mexico and almost half students from Uruguay) weren't able to consistently apply the basic math abilities in order to exploit and understand daily situations.

Specially in Brazil, several educational indicators can be pointed as revealing for the precarious situation of the Education received throughout the time by the population, despite the investments made in the last years (Klein, 2003). For example, data from the Ministry of Education indicates that only 10% of the children enrolled in public schools achieve the adequate performance in Portuguese and Math for that teaching level.

Although the access and the students' permanence in the school is a reality, a high number of students conclude 'Ensino Fundamental' without having total command of their mother language and other school contents considered elementary and indispensable to the life in the contemporary world. Even so, researches show that an approved student can be considered unsuccessful '[...] because he doesn't think from his own ideas, he doesn't allow himself to express his own thought, because he can`t write. He only register and copy the other's thoughts' (Dani and Isaía, 1997, p. 1). According to these authors, the failure is also presented in 'the student who wins, who has good marks at school and is seen as a good student because he repeats what the teacher says.'

The school failure phenomenon is one among many problems the school faces. The institution needs to look for answers to the challenges presented in its context, which are directly related to its capacity to offer high quality Education to all its students. More than ever, it's necessary to reflect about the social role and school political function verifying how and what we should do so that this institution can become an efficient instrument for promoting social changes. Nevertheless, the reflection must be followed by practical actions which surpass legal publications and the researches. They have to work as reference which allows the school community to determine directions and think of practical strategies focusing the reality the school is inserted. Having that exposed, it's valid to say it's high time a more global understanding about the institution context was promoted, as well as, the identification of teachers' perception on the school reality in order to delineate actions which consider and amplify themselves gradually, conducting them to a professional development process in the work environment.

THE COMMUNITY AND THE SCHOOL

The partner school is located in the North part of Presidente Prudente city, in a peripheral area 10 km away from downtown. That area is characterized as being socially excluded, which means, having lots of needs from different natures, among them: low schooling rating, unemployment, poor housing conditions, etc. The neighbourhood started as part of an urbanization project from the municipal government, which conventionally was called slums removal policy. In the neighbourhood surroundings there are several rural areas and houses where no one is living, which form a barrier between the neighbourhood and the rest of the city, causing a sort of isolation. The school is the only teaching institution in that community and it assists children on Children Education (0 to 3 year-old kids) and the first years of Primary Education (6 to 10-year-old kids). In that location there is no health center, although they can count on a programme called '*family health strategy*- ESF', the professionals to assist the people are not enough to fulfill the needs the families have. There are several commercial buildings in the neighbourhood such as supermarkets, a tire maintenance shop, bakery, snack bars, butcheries, sawn wood shop, construction supplies shop, a shop where you bus cooking gas, and others.

According to data taken in 2010 from a statistics institute, *Censo,* most of families (77%) of the children enrolled in the school live in the same neighbourhood and 23% live in other more distant locations. Among

the families living in the mentioned neighbourhood 80% live in their own houses, 12% live in rented house and 8% live in lent houses. Concerning the family monthly income, nearly 30% of families live with up to a minimum salary[34] and 65% of them receive about 2 and 3 minimum salaries.

When considering the parent's schooling level, it was verified that 1% of mothers and fathers have more than 15 years of schooling, (they have a university degree), those who have more than twelve years of schooling are 19% of mothers and 14% of fathers (they have concluded high school), there is also the group which has studied for about nine and eleven years, 15% of mothers and 14% of fathers (incomplete high school), those parents which have studied for eight years belong to a group of 20% of mothers and 24% of fathers (they complete 'Ensino fundamental'), there is still a significant percentage of parents which have one to seven years of schooling, 40% of the mothers and 44% of fathers (incomplete 'Ensino Fundamental') and, finally, 1% of mothers and 2% of fathers who have no or less than one year of schooling.

It's worth saying that, in a general way, this region where the school is located is composed by parents with a lower schooling level than the city average percentage, they constitute a poverty grouping in the city. As stated by Rinaldi, Morabito and Tachibana (2009), the average worker income is related to his schooling level; people whose schooling levels are higher tend to have higher income than those with low level schooling. This fact indicates that having a low schooling level affects, among other things, the access to basic consumer goods, culture and leisure, directly affecting the necessary conditions to school attendance.

It was found out that due to the families' lack of financial resources, most of the time, there is no money to buy school stationary (pencil, eraser, notebook, glue, scissors) for the kids. According to the school school planing, in the beginning of 2010, 27% of the families bought all the stationary requested, 43% bought only a few items and 30% didn't buy any stationary. In that situation, it's the school duty, besides providing education, also to provide the families in need with the stationary throughout the year so that the children have the access to school, permanence and learning rights assured.

Generally speaking the families present, in their majority (68%), nuclear compositions (father, mother and kids living in the same house), though there is a significant percentage of students who live only with the mother (29%) and 3% of them live with other relatives.

The partner school's features

The school has poor infrastructure and little physical space. It's organized in two blocks with classrooms, one for the students coursing the first years of 'Ensino Fundamental' and other for 'Children Education', administrative department, rooms for HTPC (Time for Pedagogical Collective Work) meetings, secretary, director and pedagogic advisor's rooms, reception, reading room, pedagogic support room and warehouse. The school has no adequate and well organised rooms for extra assistance to the students as, multimedia room, library and video library. In order to supply this need, some environments were improvised and adapted. The material resources, however, as very diversified existing in a sufficient number to the development of a teachers 'good work. These resources are both pedagogical and technological, for supplying and consuming.

The teachers' board is composed by seventeen teachers (working on 'Children Education' and the first years of 'Ensino Fundamental') and 4 educators (management staff). A great part of these professional have a university degree or they are about to graduate from university. Some of them have taken some kind of specialization course. Complementing this scene, the school relies on a library auxiliary (a readapted teacher), three professionals who work as ADI's (assistants for children development), three employees who are in charge of general services, a porter, three cooks and two scriveners

The institution has a total of four hundred and seventy five (475) students enrolled; ninety-two (92) of them have some learning difficulty. From that amount, twelve are diagnosed as having some disability (intellectual, multiple, visual, physical, global development and hearing disorder). The others have being supported by a competent department in the city or they've waiting for a vacancy in the list to be examined.

It's important mentioning that students who attend this school are poor children at the age of three to thirteen years old. Most of them live in the neighbourhood the schools is located or come from distant parts of the city.

---

[34] In Brazil, the minimum salary established for the year of 2010 was R$ 540,00. In the year of 2011 this amount corresponds to R$ 545,00.

THE PARTNERSHIP BETWEEN THE UNIVERSITY AND THE SCHOOL: FIRST APPROCHES

The project started as an initiative from the city Municipal Secretary of Education, intending to develop a partnership with researchers from university, looking forward to understand and overcome the difficulties and challenges struggled by the city schools, in order to improve the low results obtained by IDEB, a national indicator of Primary Education Development. Because of those results, a new municipal policy was created focusing on the improvement of school failure condition. The partner school was indicated due to the fact its result in IDEB was one of the lowest in the country.

The development of a formative and investigative work with teachers and teacher's trainers in the school context demands the establishment of a trustful relationship which is gradually constituted; it requires collaborative working among the school staff and researchers; it implies the development of many procedures that are favorable to a partnership and mutual learning process(Cole & Knowles, 1993) in a way that professional development is the spot for the main work, no matter which policies are valid at the time. This perspective includes the systematic investigation on the consequences caused by the work done to change the social relations in the community been investigated (Aldenam, 1989).

A process of such nature offers challenges related to the peculiarities of the context and subjects involved, as well as, to the model chosen to the project's development, based on collaborative intervention-research.

That supposes the adoption of a methodological approach which allows understanding, interpretation and description of the teachers and researches' decision making process and the actions they take, in addition to the difficulties mentioned by the teachers and their professional development process aimed at the construction of possible solutions to the problems faced by the school. On the other hand, this approach must make possible the educational process's understanding, those which take place in the school context and in each classroom of the different partners (teachers and researchers).

The project's development has shown through the first analysis that:

- Teachers' thoughts are expressed by their testimonials in the meetings, a tool used to make an initial diagnosis, indicating their expectations about the researchers having ready answers to help them surpass the challenges they're facing.
- The inclusion of the researchers' group in the school environment and the collective construction of a common for professional development is a process which can be considered as having instable balance and which needs to be reformulated at any time, it demands a high level of involvement from the participants and a permanent negotiation process.
- The main challenges mentioned by the teachers and teacher's trainers are strictly related to indiscipline; lack of interest and family support in the schooling process; and the teaching of children studying the mother language (literacy process), they just don't learn despite not having any diagnostic showing disability or learning difficulty.
- The most evident difficulties were related to the implementation of public educational policies, most of them do not come to the school ad classrooms, or when they do, it happens in a vertical way, they have difficult comprehension language, layout and concepts to be applied to daily pedagogical activities (for example, 'Reading and Writing Programme', adopted by the municipal politics as a strategy to overcome the low results obtained by the public teaching system).
- During the first year of this research, we are dealing with situations which make us reflect about the actions taken, we deal with narratives in which the participants' beliefs, values and inner theories emerge. It's possible to realize that the situations which consider the teacher's and teachers' trainers context, seem to mobilize deeper beliefs which escape from the dominant speech censorship, for example the public policies, the democratic management, the teaching quality and school inclusion.
- The beginning of interventional activities in the school, which is, the development of collaborative practices present signs about the importance of permanently investing in the construction of a school collective, which aims, as the time goes by, make teachers accept and talk about their teaching practice, confronting them with their peers, and discussing about it in a less offensive way, having objectives, systematizing, suggesting strategies, allowing the gradual access to their secret stories. Such expectation is also strictly connected to understanding the partner school cultural dynamic. The challenge continuously faced in the execution of this research is the construction of new formative and investigative strategies in the school context, that, in a procedural way, show an answer to the problem investigated. On account of the teachers understanding their professional qualification as an external experience to the school context, for example, the participations in events (congress, lecture, course) and the qualification course offered by the Municipal Secretary of Education.

CONCLUSION

This article has presented and analysed partial data taken from an ongoing research being carried out at a primary school located in a city in the west of Sao Paulo State, in Brazil. The referred study involves researches from two universities in the same city and twenty seven professionals connected to the partner school.

By investigating learning processes and teachers' professional development, one of the main goals of this project was to plan and execute a program which could involve the school teachers in their professional development. For that reason, an intervention-research has been carried out; this research of collaborative nature implies a partnership process and multiple-learning among the participants.

Through this perspective, building knowledge on the process of teachers' professional development and educators in the work context is essential to analyse and understand the problems faced by teachers daily in the school. Regarding this experience it's expected to bring improvements as much as to the school staff, as to the children enrolled in it, as well as to their families. It's also expected that, in short period of time, the program causes an impact on the teaching and learning processes developed in and by the school.

109 - Survey – Intervention: Teacher Training from a Professional Development Perspective on On-line Continuous Training Courses

Marilce da Costa Campos Rodrigues [1] and Aline Maria de Medeiros Rodrigues Reali [2]

The São Carlos Federal University, Brazil
[1] mcamposr@terra.com.br, [2] alinereali@gmail.com

Abstract: This text presents some reflections on the first stages of a Doctoral research project, an investigation-intervention, focusing on the training processes of teaching staff that teach the initial years (1st, 2nd and 3rd) of primary education in Brazilian public schools with the aim of developing and assessing professional development indicators. The study is methodologically grounded on a constructive-collaborative reference of investigation. These indicators are conceived as reference parameters for the work developed by the staff and constructed by them. The process of constructing such indicators is being undertaken by training-investigation using the internet as a tool that provides learning spaces. On reflecting with the teaching staff on how the definition of the specific teaching content to be learnt by the children is done, the degree of proficiency to be achieved, how the students learn and why they should learn and articulating this with teaching knowledge, the aim is to construct and assess professional development indicators with the teachers that have worked in these years.

Keywords: Educational Indicators; Professional Teacher Development; Teacher learning; on-line teacher training.

INTRODUCTION

The reflections presented here refer to an interventionist investigation registered in the "Professional development of teachers – construction and assessment" Project financed by the CNPq and undertaken on the Post-graduation in Education program of the Federal University of São Paulo, Brazil. This focuses on the teacher training-investigation process which is in its final data collection phase. In this study the aim is to construct and assess professional development indicators for teachers that work in the initial years of primary education in municipal, public schools in Brazil.

When thinking of the construction of educational indicators, we thought of them as professional development indicators based on the process, since teacher professional learning is founded on processes and not on fragmented episodes. They would be reference parameters on the work carried out by the staff involved in the study and constructed by the teachers themselves. The teachers will construct the indicators, will experiment with them and will assess them. The axis used for their construction will be, firstly, the definition of the specific content to be learnt by the students followed by the knowledge required in order to be able to teach them.

This process is being undertaken in the form of training-investigation with the use of the internet as a tool for learning spaces. The intervention in this study consists of an extension course for teachers who work in the initial years of primary education with the aim of

> contributing to the professional development of teachers allowing them to reflect on their teaching and learning experiences within the context of their work, using as a reference the indicators for the construction of a knowledge base of the students and articulated for exercising the job of teaching (Rodrigues, 2009, p. 4).

On the course we are therefore reflecting on the process of defining the specific content to be learnt by the children – what should be learnt (content), the degree of proficiency (how much), how the students learn and why they should learn it (how and why), as well as mapping and analyzing what the teachers know how to teach and which kind of professional behavior dominates the execution of their activities in school – their knowledge base, what and to what degree they should know as well as what and why they need to learn, and how this can be achieved, as argued by Rodrigues (2009) in her research project.

For the purpose of organizing this text, we will first deal with the educational indicators of professional development followed by teacher learning and knowledge base for teaching articulated with the processes of continuous teacher training by distance learning. It is important to remember that when speaking of

indicators we are relating them to the specific content that needs to be learnt by the students followed by the knowledge required by the teachers in order to teach them. The issue is the student knowledge base allied with the teaching knowledge base which are essential focus points for this study.

THE ON-GOING INVESTIGATION

The construction of professional development indicators for educators, together with the reflections on the knowledge base required to teach, will aid the decision making processes, both on an individual level as well as on a group level, on the processes present in the teaching work, allowing for the participants to reflect on the work carried out.

This construction process is intertwined firstly with the definition of the specific content that the students should learn in the initial years articulated with the knowledge the teachers need to have in order to teach them in their work contexts - their knowledge base for teaching. A discussion is held on a continuous training course since we believe that this best suits our enquiry process. We therefore want to establish the position of the teacher training whilst professional development extends for a whole lifetime and is based on life experiences and a number of different modes of knowledge which, according to Cole and Knowles (1993) permeates all professional practices.

According to Mizukami et al. (2002) this base means "a collection of understandings, knowledge, abilities and dispositions necessary for effective action on specific teaching and learning situations" (p.67). Here there are different types of knowledge the teacher can use to make decisions and according to Shulman (2005) these types of knowledge can be categorized in the following manner: knowledge of the content, general pedagogical knowledge, knowledge of the curriculum, pedagogical knowledge of the content, knowledge of the students and their characteristics, knowledge of the educational contexts and knowledge of the aims, purposes and educational values and their philosophical and historical fundamentals.

Furthermore, according to the above-quoted author, we can unite the knowledge of the curriculum, the students and their characteristics, knowledge of the educational contexts and knowledge of the aims, purposes and educational values and their philosophical and historical fundamentals into three types of knowledge.

One of these is knowledge of the specific content that includes the basic concepts of one area of knowledge. General pedagogical knowledge is the knowledge that transcends the dominion of a specific area and includes knowledge of the aims, goals, educational purposes, teaching and learning, classroom management and interaction with the students, teaching strategies, other content and knowledge of the curriculum and pedagogical knowledge of the content that is constructed during teaching (Mizukami, 2002). This is thinking pedagogically about what we teach consisting therefore of the understanding of the teaching knowledge base. This is why, in this study, we are reflecting on this base together with the educators.

When reflecting on what teachers should be able to learn, in terms of learning indicators of what was taught, we point out that this issue is related to activities that are directly connected to the educator and learner as well the teacher as a person which goes beyond teaching classes. This is a way of thinking that is interlinked to the participation in broader processes within the institution of a school

This learning and professional development of teachers are aspects that can influence teaching quality in our schools. Thus, we believe that by reflecting on teaching knowledge we need to implement ways of reconstructing and constructing such knowledge, aspects that are referred to in this investigation in relation to the student's knowledge base – what they need to know at the end of the first three years of primary school.

Thinking in this way about professional development and teacher learning, the investigation-intervention has been delineated with the focus on continuous training of teachers by distance learning. This training-investigation is justified by issues that are present every day in our schools, the teaching act that needs to be understood with the aim of providing feedback from the whole group of teachers being investigated.

The teachers that participated in this are spontaneous collaborators in this study, since we considered that teacher participation, in any training context, needs to be voluntary, by choice, because we believe that the learning processes must be suitable and not passed on. Based on this, the registrations for the course were opened in August 2010 and those interested could register directly at the Teacher's Portal. In this phase, we received 866 registrations from the whole of Brazil. However, we could not deal with such a large demand and we started the training with 42 participants who were teachers that worked in the public, municipal school network and who taught the initial years of primary education.

After the selection of the course participants, the continuous training started in which the content is organized giving emphasis to reflexive and contextualized teaching divided into four modules totaling 120 hours. The first and second modules were given from September to December 2010 and the final two

modules are being held between February and April 2011. These aim to provide digital literacy since not all of the participants are familiar with the Moodle platform. Also included are lessons on municipal and school policies, class content given by the teachers as well as their own knowledge to develop their own work. At this moment, in the month of March, we are finishing the third module.

The procedures used to enable the training and data collection will be the communications between researchers and teacher-collaborators which take place in the online learning environment. For this purpose, there are some technological tools available on the Moodle platform used as resources for presenting activities such as: a forum, a wiki, email, assignments, diaries etc.

In the this training process the researcher is the mentor (trainer) of the course and will mediate the whole training course for the participants within the concept that (re)building will take place at every instant in the coming and going that presupposes the uptake of some of the steps established. Thus, the reflection, negotiation and reorganization of the training and investigative actions will be prominent aspects in the training. To achieve this and for the individual follow-up of the assignments we have a forum for communication between trainer and trainee where access is available only for the two teachers. This is a tool that allows for individual intervention during the training program.

When emphasizing the training aspect based on professional development, we should highlight the fact that there is an implicit need for constant reflection-investigation- assessment. The training path needs to be reflected on from a self-learning point of view whereby each teacher (Weffort, 1996) in training can progress at their own pace enabling them to perceive the observed, reflected and recorded reality (of teaching practice) and therefore be able to seek the mechanisms that allow them to think about and interpret it. Thus, we approach teacher assessment in both a qualitative and quantitative way. In the former we turn to pensive reflection and in the latter we consider the more structural aspects of the course and the participation of each trainee. However, the two are mutually complimented in the assessment process.

In order to aid the qualitative dimension of this training program, a reflexive recording instrument is used at the end of each module. This is a partial assessment that includes the training reports whereby each trainee registers their reflections pointing out the learning points that were constructed and quantitative mapping (of the number of participations in the forum and/or other activities, the number of times assignments were handed in before by the deadline and, furthermore, why and how each trainee can improve in the following module) of the frequency of participation in each activity. This as a self-assessment of the actions developed in the training program, and at the end of the course, in April, a reflexive report will be produced whereby each teacher will reflect on the impacts of the course on the execution of their professional practice based on the recognition of the situations experienced on the course and a self-assessment of the professional learning attained.

We emphasize that the training assignments proposed on the course aim to provide a space for the teachers to reflect on what they are doing mainly in terms of the content that they are teaching; the school knowledge that the students should acquire, what they need to know to ensure student learning etc., and record this in their narratives. This takes place within a perspective whereby the teachers can learn with their students whilst they carry out their teaching activities and reflect upon them, as according to Darling (1997). Furthermore, they observe the work carried out by the students and take part in what they see.

The online narratives collected during the course will the essential source for the production of training-investigation data since we understand that, as according to Cunha (1997), there is no point in just saying that the teacher has to teach based on the students' experiences if they don't become the subject of their own stories in the processes of training, constructing/deconstructing from teacher experiences. This can cause change in the form of how people understand themselves and others and these are considered to be important training strategies in the reflective processes of teaching practice.

Thus, the internet is an element of information technology and communication that is essential in this investigation-intervention. It is a tool that allows access to distance education with the Teacher[35] Portal

---

[35] Website of the Federal University of São Carlos, the Education and Human Resources Center of the Education Faculty, Department of Teaching Methodology. Created with the main aim of developing a set of projects and activities by means of a virtual space directed towards meeting the training needs of teachers of different levels and modes of teaching. The research activities are considered to be a complimentary aspect of the professional development programs and activities in the Teacher Portal. The in investigations made here aim, on the one hand, for the programs and activities to contribute to the professional development of teachers, the promotion of distance education, the establishment of a professional learning communities and, on the other hand, to reflect the contributions to and from educational research.
(www.portaldosprofessores.ufscar.br).

acting as a technological instrument of access for the course participants and as a space to access continuous training as well as for collecting data from the online narratives by the teachers within a virtual learning environment.

This virtual portal, in this investigative-training context, is a training and research tool. According to Rinaldi, Dal-forno and Reali (2009), distance education, mediated on the internet, used in teacher training processes

> can allow for approximation and follow-up of professional practice in the work context regardless of geographical context which leads us to build paths that aim for differentiated practice by those involved as well as the broadening of the knowledge base and the possible construction of communities or learning networks between professionals in different locations without the barriers of time and space (p. 2).

However, this process is complex, dynamic and challenging for the trainees as well as for the trainer-researcher and one of the authors of this article. This is because the training path is in constant movement and therefore the activities are being organized according to the collective training needs with the main axis being the achievement of the training objective articulated to that of the research. This is a unique process in the training-investigation that requires the researcher-trainer to mediate the trainee's learning process.

From this viewpoint, the continuous distance training in the form of intervention, was planned to allow for the generation of information about the state of learning of the teachers and at the same time build up other learning with the collaborators (research subject participants in the form of training-investigation).

However, working with continuous distance teacher training is still full of challenges in Brazilian education despite being, as stated by Belloni (2002), a phenomenon that is part of a wider educational innovation process that is integrated with new information and communication technology in educational processes. Mizukami (2009), referring to these challenges, presents the existence of two: "that of learning new ways of thinking about teaching and learning processes and that of unlearning practices (of some crystallized ways) in relation to the teaching training processes" (p.310). This means that the investigation-intervention in discussion has the intention of pervading these feelings since their focus is the training of educators.

This investigative process is methodologically structured in research and constructive-collaborative intervention. This is consistent with the possibility of ensuring the most satisfactory conditions for the professional development of the teacher collaborators in this study as well as for the researcher. For Clark et al. (1996), this occurs bearing in mind the process of shared dialogue established by the group. This is a process where one learns from another and become partners in reciprocal learning based on the assumption of collaborative works between teachers and researchers as stated by Cole and Knowles (1993). This is guidance directed towards enquiry into the purpose of generating new knowledge by questioning the daily teaching actions.

When a study is based on a constructive-collaborative model of investigation for the construction of intervention-investigation strategies, the path that has been followrd was set out from the beginning, however, process actions are constructed and redirected throughout their development and act to aid future steps that are to be taken in training-intervention (Rinaldi, Dal-Forno & Reali, 2009).

A collaborative investigation, such as our study, should induce teachers to

> theorize on their practices, questioning, in their contexts, the actions and their consequences and understanding the relationship between circumstance, actions and the consequences for their own lives. The collaborative work of investigation-action presupposes the joint work of investigators and practitioners with subsequent implications for both. It presupposes a learning process focused, fundamentally, on the planning of action and the assessment of results (Simão, Flores, Morgado, Fortes & Almeida, 2009).

This is a path which is being laid out in this investigative study still in progress. A route supported by the reference of professional teacher development, signaling the involvement of learning and, essentially, of change. Soon, our understanding of the training process is that it is contextualized historically and socially constitutes a political act whereby there is the occurrence of articulation between people, professionalism, context and institutionalism.

CONCLUSION

This research is in the final phase of data collection and therefore we still do not have the results of this investigation. However, we expect to achieve the construction of indicators in relation to the student knowledge base and the teacher knowledge base. Thus the analysis categories will be related to the two large

sets of inter-related data: those related to the student knowledge base and those related to the teacher knowledge base.

It is hoped that these indicators will aid, with a set of knowledge on the topic studied, the decision-making process of the school community, teaching system and other sectors of educational interest. Knowledge that is linked, mainly, to teacher action and their individual and collective training needs that provides professional development for each teacher. Such indicators will be able to be used as base elements for the construction of actions that are unique to each school context and culture, taking as a reference point the characteristics of each group studied – the investigation collaborators that belong to the different Brazilian states and who are in different stages of their careers. Also, that may still act in the way teachers think and act (Reali, 2001).

The construction and assessment of educational indicators will provide reference points to describe and support the complex and varied nature of teaching work and this will detail what teachers need to know, understand and be able to do as well as offer guidance to the structures that can support the training and development of teachers.

We also believe that success in the context of any continuous teacher training program is intertwined with the capacity of the school units to implement the individual and collective projects that respond to their concerns and thus build up some platforms to help overcome the problems that they deal with in their own universes.

An investigation, such as the one being reported here, aims to allow the participants to "interact and modify their ways of thinking, learn new actions and transform their professional identities" (Reali, Tancredi & Mizukami, 2006, p.158) and begin to build themselves up into a learning community, albeit virtually, so that they can reflect on their professional roles, as the context of the work is conceived as a place for constructing professional teaching knowledge where it is possible to diagnose, propose and intervene.

Thus, by reflecting with the teachers on how the definition is reached of the specific content to be learnt by the children, the degree of proficiency to be reached, how the students will learn and why they should learn articulated with the teacher's knowledge, we propose to construct and assess professional development indicators for teachers that work in the initial years of primary education.

112 - Contextualistic Insight to Judging Good Practice: Dynamics of Professional, Situational, and Personal Contexts in Teaching

Khalil Gholami

Department of Education, University of Kurdistan, Iran
Khalilgholami2002@yahoo.com

Abstract: This paper addresses the contextual nature of teachers' pedagogical activities. Findings suggested that teachers' activities can be judged upon in line with three intertwined contextual dimensions of teaching: professional, situational and personal. Each of these contexts had different characters and categories, based on which the teachers acted in the classroom. The teachers argued that their practices were good enough because they were done according to the realities of these contexts. A meta-analysis on the findings suggests that foundational epistemology should be replaced by contextual, if one wants to judge the "goodness" of teachers' practices.

Keywords: Contextual epistemology, practical argument, teacher thinking,

INTRODUCTION

The "contextual character" of teaching has been discussed from different perspectives. A group of teacher educators and educational researchers reflect on the pedagogical dimension of teaching and argue that life in the classroom is volatile. Thus, the theoretical pedagogical knowledge may not fully meet the demands of teaching context (Gholami, 2011; Clandinin, & Huber, 2005; Elbaz, 1981; Meijer, Verloop, & Beijaard, 1999; Pendlebury, 1990; Toom, 2006). From this perspective, teachers use their practical knowing to acknowledge the unstable environment of teaching profession. This perspective suggests that judging good teaching may not be obtained from the viewpoint of others; therefore there would be no fixed criteria or standards to see if teachers and students were engaged in suitable activities in the classroom.

From a different perspective, analytical philosophers raise a simple question: how does one, as a third-party i.e., an external inspector, knows that teaching practice is taking place in the "sound" way upon entering a classroom (e.g., Hirst, 1971)? This reflection indicates that anything that teachers are doing in the classroom may not represent good teaching activities and thus, teachers are supposed to acquire the "necessary and sufficient conditions" for doing sound teaching (Stickney, 2009). Several other philosophers of education support the same standpoint arguing that teachers should show that their practical knowing and practices are "reasonable" and "good enough" (e.g., Fenstermacher, 1994; Feiman-Nemser & Floden, 1986).

This means that "wisdom of teaching practice" does not entirely follow the same rationality in analytical philosophy, and thus, judging sound or unsound teaching should be based on different criteria and procedures. In teaching, commitment to sound teaching is not grounded in "rational justification", but by teachers' "solidarity" in their narratives rooted in their historical background of which they have become that allows them to have a particular voice distinguished from others (Rorty, 1989). In other words, the concept of "true justified belief", which is the focus of foundational and traditional epistemology (e.g., Van Goor, Heyting, & Vreeke, 2004), may not be applied to context of teaching (Gholami & Husu, 2010). Therefore, "judging teacher performance requires deep contextualization….Sensitivity to teaching acts within complex settings such as classroom calls for extended, situational analysis and constructive feedback, instead of one-off visits employing category rating systems" (i.e., providing checklist for visitors to see if teachers were engaed in suitable activities) (Stickney, 2009, p. 214). This contextualistic epistemology is acknowledged because not only it meets the demands of unpredictable incidents in the classroom but also targets the morally-loaded commitment toward students. Contextual approach to reflecting on "good" teaching, however, is both theoretically and empirically understudied. Even though philosophical reflection on contextual epistemology in teaching has put it in the public discussion, empirical studies give us more insights into topic: educators know how this important issue, regarding to teaching and teacher education, can be seen and understood from the inside. This paper discusses the results of an empirical study on contextual epistemology in teaching from teachers' perspectives.

METHODS
Design and participants
Using a "concurrent nested mixed strategy", I studied teachers' insight into the context of teaching. This approach has a predominant method that guides a research project. "Given less priority, the method (quantitative or qualitative) is embedded or nested within the predominant method (quantitative or qualitative)" (Creswell, 2003, p. 218). The predominant approach of this study was qualitative: quantitative method was nested within its data analysis phase. I "purposively" (Creswell, Plano, Clark, & Nebraska, 2007) decided to select the participants who had been teaching at least four years. Based on this specific qualification, the semi-structured interviews conducted with six elementary teachers from Helsinki (Finland) and two middle school's teachers from Iran were the source of data in this paper. Table 1 shows the participating background:

Table 1: the participating teacher in the study

Participants	Teaching experience (year)	Grade	Gender	Education	Nationality
Teacher 1	4	4 and 5	Female	M.A.	Finland
Teacher 2	4	4	Male	M.A	Finland
Teacher 3	9	3	Male	M.A.	Finland
Teacher 4	10	5	Female	M.A.	Finland
Teacher 5	15	3 and 5	Female	M.A.	Finland
Teacher 6	17	4	Female	B.A	Finland
Teacher 7	8	7-9	Male	M.S	Iran
Teacher 8	6	10-12	Female	M.S	Iran

Data analysis
Relying on the "grounded technique" of analysis, *at the first phase*, I started the process of data analysis from semi-structured in three steps. After reading the most part of data and having a general sense of it, in the first step *(open coding),* I analyzed the data related to the least and most experienced participating teachers. In this stage, I wanted to reduce the data to meaningful chunks. Each chunk was a coherent part of data in which a main idea was embedded. I extracted the main idea of each chunk with a very abstract description including few words or short sentence. In the second step (*axial coding*), the main ideas and meanings embedded in each chunk of the data (i.e., the data related to same teachers in the first step) were reviewed and examined to see how they might be clustered into slightly more abstract categories. In this way, it was possible to attribute chunks with common meanings and intentions to a particular category. These categories were called "lower categories". At the end (*pattern coding*), I clustered lower categories into a small number of "upper categories". Then, Upper categories were used to generate the highest level of meaning in the categorization: the theme (see table 1). At this phase, I developed initial system of categorization including different categories and subcategories.

At the second phase, I entered the other part of data related to other four teachers into Atlas.ti for following purposes: (a) to see how categories and subcategories in the first phase may explain the new part of the data, (b) to establish a link between the whole data analysis based on the structure of Atlas.ti, including different objects such as memos, codes, and texts in order to be able to organize and find the patterns in the data analysis, and (c) to gain an quantitative insight into the data based on the total number of analyzed codes. At the end of this stage, I could make sense of data both qualitatively and quantitatively.

Table 2: Reduction of main ideas to categories in the process of data analysis

Main Ideas extracted from chunks (3 chunks)	Lower category	Upper category	Theme
(a)Teacher did not allow students to ask question during the teaching so that the lesson would be finished on time, questions during the course of teaching are a waste of the time;(b) teacher did not allow students to talk to each other so that they can concentrate on lesson; (c) teacher asked a student to go the corner of the classroom to allow other students to work.	Fear about fulfillment of learning tasks	Preventing pedagogy	Professional context

FINDINGS

I studied the teachers' reasoning and justifications behind their pedagogical beliefs and actions to understand the contextual character of teaching. There were three significant contexts in which the teachers' justifications were rooted: the practice of teaching as a professional context, the classroom of teaching as a situational context, and the voice of the teacher as a personal context.

Professional context

In this theme, findings indicated that teachers frequently pointed out that the purpose of their actions was to establish a good and suitable "learning environment". They wanted to do something that could help them conduct their classroom activities smoothly. Representing teaching as a contextual entity, the professional context was reflected in the teachers' practical arguments in two distinct ways: "initiating pedagogy" and "preventing pedagogy".

Initiating pedagogy

The first important area of professional context was found to be related to the pedagogical practices that the teachers "initiated" and "accomplished" in order to move from the "existing typical condition" to a "more enriched learning space" in order to foster the learning capacity of the students. In this way, even though teaching situations were running in a normal way, the teachers wanted to improve the learning atmosphere in their classrooms. The initiating pedagogies aimed at different intentions, including "fostering the learning properties" and "nurturing the character" of the students.

As a significant base for their actions, teachers tried to help students improve their learning properties including three important dimensions: "higher order thinking skills", "learning orientations" and "learning engagement". These elements were interrelated, complementary and sometimes overlapped to each other. The first dimension (i.e., higher order thinking) included strategies that could enable students to find reasons for their learning tasks and thus to judge and evaluate them; to think rationally and ask logical and sensible questions in the classroom; to answer the questions with evidence and good reasons; to enhance their thinking processes; and to construct knowledge on their own. From this point of view, improving higher order thinking skills was conceived as a valuable pedagogical task and thus, teachers should provide an instructional environment such that students' skills in this category would be fostered.

The second dimension of improving students' learning properties was to enhance the students' learning orientations. Data analysis showed that the learning orientations were different from higher order thinking in that, the former dealt with the level of students' thinking and learning while the later was related to the ways and skills which students supposed to apply them for enhancing their higher order thinking. Enhancing the students' meta-cognitive skills in learning tasks (i.e., learn how to learn) and social skills in interaction with others were two basic elements that the teachers intended to realize in regarding to the students' learning orientation.

Improving "active engagement" in the classroom was another significant element of teachers' justification in line with enhancing the learning properties of students. In this area of concern, the teachers indicated the importance of encouraging and confirming students to participate in the classroom activities (e.g., answering the teacher's questions or asking relevant questions); keeping the learning motivation alive; accommodating individual differences (e.g., designing more challenging learning tasks for capable and gifted students, and normal tasks for other students); and encouraging the passive or less-motivated students to be more engaged in the classroom. The following example shows how active engagement represents the "initiating character" of the teachers' pedagogy. The teacher has decided to start and "accomplish" a risky action (i.e., asking more questions may interrupt the classroom flow) in order to enhance the learning engagement of students:

> …even though it may interrupt the flow of my teaching, I try to call on students to answer my questions many times in a single lesson because it provides a good means for them to engage in and to think about the concepts in the lesson. I know this encourages most of the students to take the risk to answer my question or ask their questions (T2).

From the teachers' perspective, the data indicated that active engagement was of the most significance in the initiating pedagogy. Teachers supposed that through active engagement, they would be able to accomplish many other intentions that they had for the students (e.g., such as enhancing social and problem-solving skills by active engagement in learning tasks).

Along with the academic and learning-based intentions, the data suggested that the teachers focused on the "nurturing the personal character of students" as an important dimension of their professional obligation.

Here, the teachers' actions aimed at establishing good behavioral norms in the classroom life that supposed to "enable" the students to have effective and constructive interaction with others in different social contexts, including the classroom and society as a whole. At the classroom level, the teachers wanted to teach students to encourage them to learn how to respect, cooperate, have fairness, be polite, and take turns in classroom activities vis-à-vis their classmates. Teachers 6 and 7, for example, argued that teaching was not only transmitting content of the text books and pointed out that "one of the things that I have told the parents of students is that I want to focus more on getting the students to behave well and be polite, empathetic, friendly and nice to each other before I start working with academics".

At the social level, the teachers argued that their actions and supporting knowledge were good since they could teach students to learn how to cope with their social problems, participate in social events (e.g., how to attend a concert), be ready for the future by shouldering social responsibilities (e.g., career), and be tolerant toward the others' values and cultures in the social encounters. For example, teacher 5 several times had her lunch with students. She pointed out that "these students need to learn how to behave in the social contexts. When I have lunch with them, they have a good feeling and during the lunch, we discuss many things related to matters out of schools". Teacher 8 argued that students must be "sensitive to social issues in such a way that we teachers be able to encourage and motivate them become good citizens". Teacher 7 stated, "if needed, he will scarify academic side of his job in order to enhance and nurture the character of his students". From this point of view, teachers conceived classroom life as a virtual community and a bridge to real society, and students needed to practice the necessary behavioral skills in order to be ready to live in their societies. In my interpretation, this was a part of the teachers' pedagogical obligation that turned the teaching into a professional context.

Preventing pedagogy

The data revealed that teachers in many of their pedagogical decisions expressed a kind of "fear" regarding to some undesirable events that might happen in the classroom. Accordingly, teachers assumed that in the professional context of teaching, there would be obstacles to interrupt the learning activities. Because these dilemmas have an effect on the function of both teachers and students, thus there should be appropriate and practical actions for resolving them. This part of the teachers' practices was related to what I call "preventing pedagogy", i.e., the kind of pedagogy that deals with tight spots in the classroom in order to prevent unpleasant and unwanted events. Preventing pedagogy was found to address the following examples:

- Fear about managerial smoothness in the classroom,
- Fear about right fulfillment of learning tasks, and
- Fear about students' negative affective reactions.

The fundamental intention underlying "managerial smoothness" was to prevent "educational disruption" while teaching. The teachers pointed out that they had classrooms including many students with different characteristics, and if there was any interruption in the instruction, then it would cause a muddled situation wherein students might not be able to maintain the momentum of the lesson and lose their concentration. The data suggested that the teachers had two distinct types of managerial concerns while teaching: preventing misbehaving and the desire to establish discipline and order in the classroom. Teacher 7 argued that "a classroom needs order and I always inform my rules and regulations to the students at the beginning of each academic year". Teacher 2 stated that as a teacher, "you sometimes have to consider time limits and tell students to shut up if they break the rules and suspend them".

The second type of preventing pedagogy was the teachers' fears about whether the students performed learning activities in the right ways. The teachers explained that they wished to inform the students their mistakes and prevent any misunderstanding in the learning of academic concepts. Teacher 2 rejected to use group-work strategy in the classroom because he assumed that "this method is wasting time since most of the time, I see students would involve in talking and doing funny things and they pretend that they know things and do tasks in the right way, but it is not really true".

The third type of preventing pedagogy fear about students' negative affective reactions. The most prevalent example was found to be related to what the teachers called "misjudging". Teacher 3, for example, stated that "he gave permission and opportunity to students to ask any question during the break after teaching, because he had such belief that if one student comes many times to the teacher and ask questions, then the others may think that he/she is kind of a stupid student. Another significant example of teachers' fear of negative reactions was when the teachers feared to be the target of students' negative emotions. The teachers said they would avoid any action that caused a negative emotional reaction from students toward them. For example, they tried to avoid "criticizing the students or pressing them to answer questions in front of

classmates" since the students might become irritated and thus form a vague and negative picture about the teachers and their pedagogical activities.

To sum up, preventing and initiating pedagogies were at the core of professional context. Preventing pedagogy differed from initiating pedagogy in the basic intention that was behind each. Preventing pedagogy was "risk-averse and associated with different senses of urgency…teachers may feel a greater sense of urgency to avoid those things they fear than to accomplish things they hope for" (Kennedy, 2004, p. 15). Thus the primarily intention was to maintain the existing learning environment in such a way that nothing challenging would happen. The teachers wanted to encourage the students to "fit" their different capability and interests in the "structure of the classroom". Initiating pedagogy, however, was risk-taking and teachers wanted to enrich the quality of the existing learning environment even though they might face challenges. The main intention of this category was to provide a context in which students could actualize their potentials. In other words, it aimed at enhancing the "students' agency": the teachers' intentions were to improve the "students' capacity" for making choices and impose their choices on the "classroom and school structure".

Preventing pedagogy was applied to avoid losses or at least achieve some benefits by keeping the current situations, whereas initiating pedagogy was carried out to achieve more benefits. A meta-analysis on findings shows that in the teaching context, preventing and initiating pedagogies are not isolated from each other, but intertwined: realizing the intentions embedded in preventing pedagogies may be considered the pedagogical basis for moving toward initiating pedagogies and realizing their associated intentions. In line with the research task, I should argue that both initiating and preventing pedagogies are important in providing a healthy environment for students to learn and be nurtured. Thus actions and beliefs associated with these pedagogies may help us to have a fair judgment about the goodness of teaching practice.

Situational context

In this category, the data suggested that the particularity of events in the classroom situations was reflected in the different interventions. These interventions were found to be external variables that could bring some constraints to the teachers' pedagogical flexibility. In other words, each intervention could reflect a particular situation in which the teachers were able to act in particular ways. Two significant examples of grounds related to a situational context were, what I called, "hard" and "soft" interventions.

Hard interventions were related to the general aspects of teaching. Variables such as time of teaching (e.g., morning or afternoon), size and location of the classroom, equipments in the classroom and the number of the students in each classroom were found to be associated with hard interventions (Gholami & Husu, 2010). These were called *hard* interventions because they were related to the physical and non-instructional aspects of teaching which were found to be more exact, obvious, specific, and consistent in their characteristics: each hard intervention was narrow in its focus (e.g., the size of a classroom –as a justification- focused on crowded or less-populated situations; in addition, everybody probably had a clear picture of a highly populated or a less-populated classroom). Participants 7 and 8 argued that "depending on the age and grade of students they will teach different.

Soft interventions were another set of grounds related to situational context that teachers addressed in their arguments. Moreover, soft interventions were categorized under situational context since they were found to mediate (e.g., limit) the pedagogical decisions of teachers in the particular situations in a given class. Variables such as the subject being taught and learner characteristics were found to be two important and most frequently stated soft variables in the teachers' practical arguments. They were called *soft* interventions because they tended to be more diffuse, playful, and capable of dealing with various intentions: each soft intervention covered a wide area (e.g., learning capacity of pupils covered a wide range of interpretations which were not clear-cut or exact in meanings). Curricular structure of subjects, the learner's characteristics, background, and behavioral norms were basic examples of soft interventions.

Personal context

The "voice" of the teachers was found to be a significant entity affecting many pedagogical decisions in the classroom. The data suggested that this voice rooted in the teachers' "lived" experiences. The teachers had different family background, cultural values and even professional experiences and these differences shaped the "deepest" layer of thinking directing many pedagogical decisions. I called this kind of thinking "phenomenological pedagogy" in that the teachers found to look at the classroom situations and professional contexts from the perspectives of "-old" and "new" experiences that they had both "outside" and "inside" of the school community. I found that the voice of the teachers was a strong pedagogical tool in the filtering in or out the pedagogical decisions that were made based on principles and rules of "situational" and

"professional" contexts. The following example shows how the teachers' phenomenological pedagogy read issues in the situational context:

> (Q: I am observing that though the teachers in your school do not have very different classrooms, they approach very different rules and principles in their teaching. Do you have any idea?) A: Well! I think it is because the teachers themselves are different in many ways; we have different values come from our family and culture from our 'collective unconsciousness'. For example, I have lived and studied in a South African culture and thus, the way I look at things happening in the classroom would not be isolated from my background even though I try to do so. Sometimes, it is not you and your 'personal consciousness' that decide what to do, it is the various experiences you had; the experiences that establish a collection of deep values that turn you into a distinctive persona" (T3).

The teachers' phenomenological pedagogy was also influential in making decisions that were inconsistent with the principles embedded in the professional context. In such cases, the teachers argued their pedagogical and theoretical training would not help them a lot in establishing a good learning environment. Teacher 5 stated that "my personal experiences do not confirm the effectiveness of many pedagogical theories that I learned in the teachers' training program; I am not even going to ask my colleagues to help me because they have different views that I do not believe in."

CONCLUSION

From what I presented in this paper, I come to the conclusion that when the teachers "reason" about their practices, their thinking helps us to gain a good insight into the contextual character of the teaching. As mentioned, the data suggested that the teachers' reasoning or practical reasoning is rooted in three different but intertwined contexts: the professional, the situational, and the personal. The first set of grounds shows that the profession of teaching is considered to be a specific context demanding for particular courses of action because it is bound up with pedagogical obligations and competency: teachers need to apply different pedagogies with various functions in order to meet professional obligations. The second set of grounds indicates that the teaching classroom is also a particular context because pedagogical decisions are situational in each classroom. The situational character of pedagogical decisions is restricted to the various interventions in each encounter in different classrooms. Teachers most often decide what to do in line with interventions embedded in each situation. The third set of grounds suggests that each teacher has different experiences compared with others and thus perceives pedagogical obligations (in the first ground) and situational intervention (in the second ground) in different ways. Based on what has been mentioned, at the core of the professional context, pedagogical commitment is placed in order to enrich and improve the learning environment; what makes a given classroom situational context is "the domination of some interventions and urgency of action upon them"; and what turns teacher into a personal context is "the authority of voice and perceiving" rooted in different life experiences. Therefore, the teachers usually wanted to argue that "I take a particular action because":
- It is based on my pedagogical obligations (i.e., preventing and initiating pedagogies) rooted in the professional context;
- It meets the demands of situational interventions in the classroom (i.e., hard and soft interventions) rooted in the situational context; and
- It accords with my lived experiences rooted in my personal context.

To gain a clearer understanding of these three contexts, I nested a quantitative description while analyzed qualitative data. I simply counted the amount of the chunks or main ideas related to each category. Table 3 shows the frequency and the percentages of the main subcategories occurring in the contextual grounds:

Table 3: Distribution of contextual main subcategories based on chunks analyzed

Contextual categories	Frequency	Percentage
Preventing pedagogy	64	27.8
Initiative pedagogy	49	21.3
Hard intervention	23	10
Soft intervention	52	22.6
Personal view of the teachers	42	18.3
Total	230	100

The data indicate that in 49.1% chunks (i.e., coding units), teachers have relied on professional context, including preventing and initiating pedagogies in order to justify their activities; in addition, preventing pedagogies with 27.8% had the highest amount in this analysis. From the data related to situational context (i.e., hard and soft interventions), teachers mostly used soft interventions to support their practices.

DISCUSSION

As noted by Pendlebury (1990), life in the classroom is characterized by three related features: practice is 'mutable' because it changes over time presenting us with new configurations that cannot be ignored if our deliberations are to be sound. The world of practice is 'indeterminable' because practical questions necessarily arise within particular contexts. The third feature is the 'particularity' that comes from the previous features and makes practice particular for making any decision. Accordingly, consistent with existing reflection (e.g. Boyles, 2006; Carr, 2005; Dunne, 2005, 2003; Hamilton, 2005; Gholami & Husu, 2010; Gholami, 2011; Noddings, 2003; Schwandt, 2005 Pendlebury, 1990; Stickney, 2009; Van Goor et al., 2004), this study suggested that judging "sound teaching" cannot be met with foundational and a third-party logic. In several papers (e.g., Fenstermacher, 1994; Fenstermacher & Richardson, 1993), Fenstermacher has argued that teachers need to support their activities and knowledge with good evidence. He has pointed out that a person called "the other", in a practical argument, should elicit and reconstruct the true value of the premises in the mind of teachers. This study suggested that the "true value" of the teachers' practices was embedded in the "practical" and "practicable" (Gholami, 2011) realities of the classroom life. "The other" upon entering a classroom should consider the contextual character of teaching while judging the goodness of a teacher's activities. Drawing on Wittgenstein, Stickney (2009) critizises the foundational epistemology and maitains that "the complex weave of practices and reations that constiute our *form of life* unltimately grounds our 'agreement in judgement'…judgement concerning teachers, their pedagogical knowledge and the 'sanity' of their practices" (p. 202).

I would like to argue that this contextual character does not mean that teachers can do "anything". Instead, the findings suggested that the teachers' professional identity was shaped and re-shaped as a result of interactions among dynamic "criteria" embedded in the "professional", "situational", and "personal" contexts. Therefore, the argument for "escaping enthrallment in the criteriological approach offers no escape from criteria themselves; rather, complex practices, such as repertoires of teaching acts or cases of professional development become the criterion for recognizing something as *this* or *that*" (Stickney, 2009, p. 201). Professional, situational, and personal contexts, elaborated in this paper, can be considered as an empirical insight to judge the "soundness" of teaching practice (for more insight see Van Goor et al., 2004). Even though I have classified the contextual grounds into three categories, it does not necessarily mean that each category precisely reflects a clear-cut concept isolated from the others. Instead, these contexts are related to each other in different ways and most of the time they overlap each other (see figure 1).
Figure 1: Relationship among three dimensions of contextual teaching.

As it can be seen, on the one hand, the pedagogical obligations (i.e., the initiating and preventing pedagogies) for improving the learning environment as the main intention rooted in professional context "overlap" and "influence" the intentions entrenched in the other two categories. On the other hand, according to various interventions in the situational context and teachers' voices in the personal context, teachers "filter

in or out" the degree of pedagogical obligation and thus change the nature and the function of pedagogical practice. In the situational context, for instance, teachers try to act on the urgency of the situation while still remaining committed to the pedagogical principles in order to improve and enrich the learning environment on the one side. The urgency of a situation and its associated interventions could change the type of pedagogical actions on the other side. For example, the pedagogical obligations for coping with the demands of a big and crowded classroom are different from what is required for a small and less populated classroom. There are also degrees of pedagogical commitment in the personal context where teachers see themselves as the source of decisions.

This part of finding is consistent with Kennedy's finding (2004) in which teachers were found to have confliciting pedagogcal activities. Due to unpredictable conditions of the classroom, I also found that the teachers' pedagogical practices inherent from situational or event personal contexts were sometiems inconsistent with their intentions in the professional context. Based on the findings from this study, a further line of research would be to examine the "analytical" interactions of the three mentioned contexts since the current work is only suggesting a "discriptive" picture regarding to how these contexts are related.

127 - Professional Mathematics Teacher Identity in Pre-service South African Teachers: A Case Study

Sonja van Putten[1], Gerrit Stols[2], and Sarah Howie[3]

University of Pretoria, South Africa
1svanputten@gk.up.ac.za, 2gerrit.stols@up.ac.za, 3sarah.howie@up.ac.za

Abstract: This case study investigates professional mathematics teacher identity (PMTI) in the context of tertiary education, probing its origins, characteristics and development in the final year of study. In this study PMTI is defined as the conception of self-as-a-mathematics-teacher, consisting of an integrated and clustered system of personal and professional beliefs about mathematics and teaching, and about learners and learning and is continually developed through different contexts. The context here is the final teaching practicum in which students are sent out to schools as student teachers under the guidance of a mentor teacher. This particular case concerns a young pre-service teacher of Indian origin. Qualitative analysis of the data gathered through a questionnaire, observation and interviews revealed that her cultural background, set against the backdrop of education in South Africa, is significant in the formation of her PMTI. She seemed to hold conflicting beliefs with regard to teaching and learning, without apparent internal conflict: while she espoused the notions of learner-centred education as taught at university and deprecated the apparently teacher-centred schooling she herself received, her own teaching style was clearly more teacher-centred than she perceived. Her perception of mathematics and her understanding of its purpose were inextricably intertwined with both her teaching style and her level of involvement with her students. The efficacy of her tertiary training in terms of the development of her PMTI is examined against the manifestation thereof in the classroom. The particular thrust of this study is the investigation of PMTI *before* commencement of a career as mathematics teacher.

Keywords: Beliefs, mathematics teacher education.

INTRODUCTION

> Who is the self that teaches?" is the question at the heart of my own vocation. I believe it is the most fundamental question we can ask about teaching and those who teach – for the sake of learning and those who learn. By addressing it openly and honestly, alone and together, we can serve our students more faithfully, enhance our own wellbeing, make common cause with colleagues, and help education bring more light and life to the world. (Palmer, 2007, p. 8)

This study aims to investigate who the "self that teaches" is in pre-service mathematics teachers. The young South African education student who decides to teach mathematics is a person with the potential to make a difference to the mathematics classrooms in this country. So this research purports to gain insight into the professional identity of the pre-service mathematics teacher for "the sake of learning and those who learn".

The term "identity" comes from the Latin, *identitas*, literally meaning "sameness", which seems ironic given the uniqueness of identity as an individual construct. However, to the casual observer on any ordinary weekday on the campus of the University of Pretoria's (UP) Faculty of Education, there is a certain "sameness" to be seen: the students are all young, apparently focused as they file into the lecture halls, all apparently unified in their intention to become teachers, all interacting in the context of their tertiary training. There is thus a sociologically constructed 'group identity', such as is described by Wenger (2000) as a community of practice, of which such a casual observer might become conscious. According to Gee (2000), there are several terms in circulation which also refer to identity, like 'subjectivity' for example. However, to him the concept is best encapsulated as follows: "Being recognized as a certain 'kind of person', in a given context, is what I mean here by 'identity'. In this sense of the term, all people have multiple identities connected not to their 'internal states' but to their performances in society" (p. 99). He continues to say:

In today's fast changing and interconnected global world, researchers in a variety of areas have come to see identity as an important analytic tool for understanding schools and society. A focus on the contextually

specific ways in which people act out and recognize identities allows a more dynamic approach than the sometimes overly general and static trio of "race, class, and gender." (p. 99)

In recent years there has been an increase in academic interest in the concept of identity, stretching across all fields of academic endeavour. Fearon (1999) actually traced this growth by monitoring the number of dissertation abstracts that were available on-line since 1981 and which contained the word 'identity'. He found that between 1981 and 1995, for example, that number rose from 709 to 1 911. However, Abdelal, Herrera, Johnston, & McDermott have identified a danger in the plethora of research and interest in 'identity': "To the chagrin of the social scientific community, it is in large part this same ubiquitous sprawl of scholarship that has undermined the conceptual clarity of identity as a variable" (p. 695).

While there is a generally observable "community of practice" (Wenger, 2000) type identity of the education students at UP, when the observer is not 'casual' and the focus of research narrows down beyond what can be noticed by just walking along the faculty's corridors, the question of professional identity arises – who are these students as professionals in their field? In Gee's words, what kind of person is this in this given context? Now the "clarity of identity as a variable" in terms of their *professional* identity as *pre-service* teachers of a specific subject (mathematics, in this case) is not evident and requires investigation. What does it look like? How is it acted out in the classroom?

According to Borko and Putnam (1996), students come into tertiary training with "entering perspectives [that act] as a filter that determines how experiences within the teacher education program are interpreted" (p. 679). These filtering "perspectives" are recognised in this study as part of the professional mathematics teacher identity (PMTI) of such students, which is already in existence before they attend a single university module. These students are eventually, after three years of training at UP, sent out to schools for a practical teaching period. Palmer (2007) declares that "we teach who we are" (p. 2). By implication then, that "who we are" only becomes visible when "we teach". So, the professional identity of these pre-service mathematics teachers needs to be observed in action in the classroom, so that we can gain insight into the "kind of person" (Gee, 2000, p.99) that is to be released to teach in the South African mathematics classroom.

Context of the study

In South Africa, despite internationally recognised changes that have taken place in the country since 1994, there remains a deep and serious concern about the state of mathematics education in this country. The word "crisis" has been bandied about in the media and a large portion of blame has been placed upon the teachers and what happens or does not happen in the classroom. Ensor and Galant (2005) analyse the situation as follows: "While the pathology is widespread... we are concerned that research has this far failed to ascribe to teachers and learners a positive subjectivity [identity]. We know what they don't do, but we have not adequately grasped *why* they do what they do" (p. 301) (emphasis added). I believe that this question 'why?' is best answered by an investigation into the professional identity in the early stages of its development. Bullough (1997) confirms this:

> Teacher identity – what beginning teachers believe about teaching and learning as self-as-teacher – is of vital concern to teacher education; it is the basis for meaning making and decision making. ...Teacher education must begin then by exploring the teaching self. (p. 21)

At UP, all students in the Faculty of Education who choose to train as teachers of mathematics have taken *mathematics* as a Grade 12 subject. In South Africa, all learners take mathematics as a subject to the end of the ninth grade of their school career. After that, they may choose to do either *mathematical literacy* or *mathematics* to Grade 12 level. Therefore these students have each been in a mathematics class for twelve years before commencing their tertiary studies. As students in the Department of Science, Mathematics and Technology Education, they are required to complete, amongst others, modules about mathematical content, the methodology of teaching mathematics, and teaching practicum, and after four years they are released into the professional world of teaching.

It is against this backdrop that this study takes place: it investigates the ways in which students studying to be teachers of mathematics at the University of Pretoria (UP) "act out and recognise" (Gee, 2000, p. 99) the identity described by scholars as professional and related to the teaching of mathematics (see Beijaard, Meijer & Verloop, 2004; Boaler & Greeno, 2000; van Zoest & Bohl, 2005; Day, Kington, Stobart & Sammons, 2006; Graham & Phelps, 2003; Hodgen & Askew, 2007; Jita, 2004; Lasky, 2005; O'Connor, 2008; Walshaw, 2004; Zembylas, 2003). In this study, this specific identity is called Professional Mathematics Teacher Identity (PMTI).

Professional teacher identity
Abdelal et al (2006) describe the literature around professional identity in string terms: "the current state of the field amounts to definitional anarchy" (p. 695). The literature indeed abounds with a variety of definitions ranging from descriptions of development and function to lists of constituents. In this study professional identity is seen as a narrower version of the concept of identity. It is not the same as the "core identity" which "holds more uniformly, for ourselves and others, across contexts" (Gee, 2000, p. 99); and "is experienced by individuals as 'core' or 'unique' to themselves in ways that group and role identities are not" (Hitlin, 2003, p. 118). Professional teacher identity can simply be defined as 'who I am at this moment in this context' (Beijaard, Meijer & Verloop, 2004).

PMTI is a further narrowing of professional teacher identity in that it relates 'who I am' specifically to the mathematics classroom and the subject itself. PMTI is also narrower than Mathematics Teacher Identity, described by Bohl and van Zoest (2002) as a unit of analysis, which may include those who, although they teach mathematics from time to time or for a period, are in fact not professional mathematics teachers – they may have been co-opted into teaching the subject because there is no one else to do so in a particular school, or some such circumstance. In South Africa this happens frequently. Graven (2004), for example, tells the story of some teachers she worked with:

> For example, Moses explained that it was not considered politically acceptable as a black student to study mathematics when he was at school and college. Rather, one had to study history and other subjects considered important for the struggle against apartheid... Moses had therefore studied to become a history teacher but became a teacher of mathematics due to the shortage of mathematics teachers. Another teacher, Barry, despite having taught mathematics and headed a mathematics department for many years, explained that he was not a mathematics teacher since he did not 'even' study mathematics at high school. He called himself an art teacher since this is what he had studied ... Similarly... Beatrice used to introduce herself as 'the music teacher' despite teaching predominantly mathematics classes. These examples illustrate an effect of South Africa's apartheid history. (p. 189)

The term Professional Mathematics Teacher Identity is posited in this research as involving an individual who has studied the subject for the specific purpose of teaching it.

CONCEPTUALISATION OF THE RESEARCH
In the interests of an in-depth investigation into pre-service PMTI, this identity is examined in terms of how it develops and what it looks like. The literature (van Zoest & Bohl, 2005; Varghese, Morgan, Johnston, Johnson, 2005; Boaler, Wiliam, & Zevenbergen, 2000; Beijaard, 1995; Kagan, 1992) indicates that teacher identity is not a simple, unitary construct, but has both social (in-the-community) and personal (in-the-mind) roots, and that its nature is complex (Cooper & Olson, 1996; Stronach, Corbin, McNamara, Stark & Warne, 2002; Zembylas, 2003 Beijaard, Meijer, & Verloop, 2004).

This complexity is addressed by dividing the investigation into three main thrusts, dealing with the formation, nature and manifestation of PMTI. The overarching question is refined in three sub-questions.

How do the pre-service students at the University of Pretoria perceive the development of their Professional Mathematics Teacher Identity and how do the perceptions they have of this identity relate to the realisation thereof in the classroom?

In what way do the influencers of PMTI shape its development? This study looks at sociological and personal influencers which lie within the various contexts through which the student moves or has moved, like their schooling, cultural and family history, and the university experience itself. PMTI is described by researchers as something which is continually changing, growing, developing, situated, not fixed but dynamic. Thus the tendency to *develop* is part of its nature; consequently PMTI is subject to influences which modify it in some way. The literature indicates that the dynamics of environment and individual experience influence the formation of teacher identity in the learners who are being taught.

Beijaard et al. (2000) identify three influencing factors on the mathematics teachers' professional identity: the teaching context, her teaching experience and her biography. Where Beijaard was studying the professional identity of experienced secondary school teachers, this study concerns pre-service teachers in their final year of study. Beijaard's three influencers may in *this* context thus be seen as the tertiary environment (Wenger, 2000; Stuart & Thurlow, 2000; Smagorinsky, Cook, Moore, Jackson & Fry, 2004;

Brouwer & Korthagen, 2005; Grootenboer, 2006; Spalding, Klecka, Lin, Wang & Odell, 2011), the teaching practica (Freese, 2006; Hiebert, Morris, Berk & Jansen, 2007; Walshaw, 2010) and the student's personal background. This includes schooling (Kagan, 1992; Ball, 1993; Boaler & Greeno, 2000; Liljedahl, 2007), and biography (Day & Leitch, 2001; Beijaard et al., 2004; Anderson, 2007; MacGregor, 2009).

Researchers like Thompson (1984), Ernest (1988), Cooney (2003) and Cross (2009) have also found that the teacher's view of the subject mathematics has an effect on their professional identity. The pre-service teachers' view of mathematics is important because it has an impact on the way they teach. Adler and Davis (2006) call this a "specificity to the way that teachers need to hold and use mathematics in order to teach mathematics – and [that] this way of knowing and using mathematics differs from the way mathematicians hold and use mathematics" (p. 272).

What are these students' perceptions of their PMTI? The actual nature of PMTI is best accessed through the perceptions of the person whose PMTI is being investigated, because, as Beijaard et al (2004) explain, "[t]he world of the self may appear to the outsider to be subjective and hypothetical, but to the individual experiencing it, it has the feeling of absolute reality" (p. 108).

According to Beijaard, Verloop and Vermunt (2000), this identity can best be studied through investigation of the teacher's perception of self as Subject Specialist, Teaching-and-learning Specialist and Nurturer (referred to in their study as pedagogics expert). In their research they assumed that "teachers' perceptions of their professional identity reflect their personal knowledge of this identity" (p. 750).

However, in order for the outsider of which Beijaard speaks to gain access to the reality experienced by the person in question, that PMTI must be allowed to reveal itself in the classroom. According to Fearon (1999), identities should be seen "both as things to be explained and things that have explanatory force" (p. 2). Thus, while the student can be asked to explain the nature of her PMTI, the nature of her PMTI also explains what she does in the classroom. Only in seeing the identity in action can analysis take place of the perceptions which constitute it. This gives rise to the third sub-question which deals with the manifestation of PMTI:

How is this identity actualised in the classroom? If Palmer (2007) is to be believed and "we teach who we are" (p. 2), then "who we are" as opposed to "who we think we should be" is what can be observed in the classroom. In observing the students at work in their classrooms, it is the intention to see how they carry out the various roles that teaching mathematics requires of a teacher. Grier and Johnston (2009) speak of an overlapping between identity and function: "Although some researchers call for a distinction between teacher identity and teachers' functional roles, the two concepts are not mutually exclusive and overlap considerably" (p. 59). However, I argue that identity is *actualised* in the classroom through the functional roles that are played.

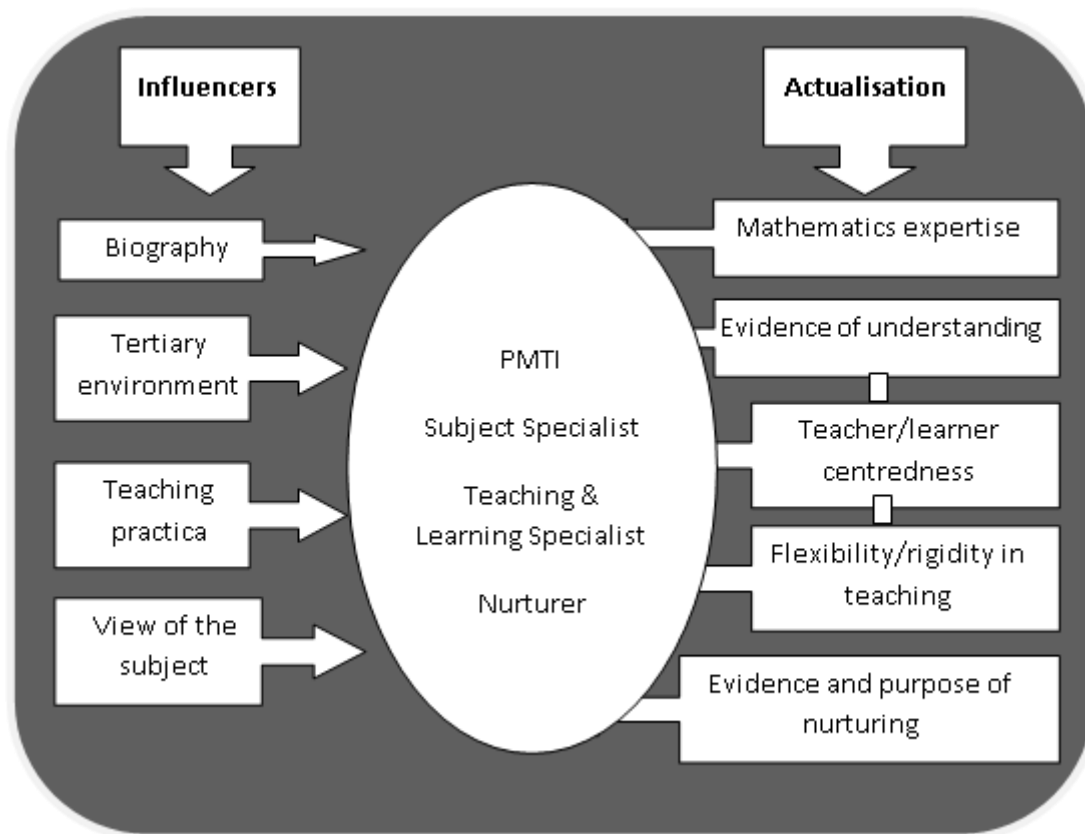
By observing the person's classroom practice in terms of their mathematical expertise, their teaching-and-learning skills and the way they interact with the learners in a nurturing role, the actualisation of their PMTI can be studied in terms of Beijaard et al's categories. A more detailed breakdown of these categories is provided by Thompson (1984), who found that teaching-and-learning skills can be investigated through observing what the person sees as evidence that the learners understand, where the locus of control in the classroom lies i.e. whether the person's practice is teacher/learner centred, and how flexible their planning allows them to be. Beijaard's third category, nurturing, I found could be observed in action by investigating the evidence and purpose of the nurturing to be seen in the classroom. The conceptual framework used for this investigation is thus visualised as follows:


Figure 2: Conceptual framework for PMTI

METHOD

After an extensive literature study was completed, in which the development and nature of professional identity was investigated, it was decided that qualitative methodology was appropriate and that a case study would best facilitate the in-depth investigation of the PMTI of students at UP.

Sample and participants

At the University of Pretoria, the BEd (Bachelor of Education), a four-year degree, is currently constructed in such a way that the subject methodologies constitute a year-long module which is offered in their third year of study. The elective subjects, like mathematics, are taken alongside of education modules and other professional studies like educational psychology across the first three years of study. For three weeks at the beginning of each of the second and third years the students are sent out to schools on a short teaching practicum exercise, in which observation is their main task. During their fourth year the students undergo further academic training for the first quarter, where after they spend the second and third terms at schools doing their "internship" or teaching practicum. In the fourth term they return to campus for small remaining modules and the finalisation of their studies. The academic subjects like, in this case, mathematics, are taught during the first three years of study only.

It is within the context of this programme that this research was conducted. The target population for this case study was the mathematics education students of 2010 in the Department of Science, Mathematics and Technology Education of the Faculty of Education at UP. This population was chosen for two reasons: convenience (I have direct access to these students as their lecturer) and the demographic diversity for which the university is known. UP accommodates a large demographic diversity and a range of backgrounds in terms of the schools from which the students have matriculated. According to Paterson & Arends (2009), UP is the second most popular tertiary institution in South Africa for prospective educators, and thus is particularly characterised by the diversity of its students.

The population in question (sixty five in all) is divided into two: those students who are preparing to teach in the FET phase of high school and those students who will eventually teach Grades 4 to 9. The latter group, while majoring in mathematics, amongst other subjects, are not necessarily subject specialists – in fact those grades tend to require generalists in terms of their fields of expertise. However, the group of students who want to teach in the FET phase (of whom there were thirty one in 2010) are trained to be subject specialists

and are therefore those who, in theory, are not only *able* but who also *desire* to teach mathematics to learners who have chosen to continue with the subject to Grade 12 level. It is this group of students who form the sample for this study. Of the thirty one students, twenty five consented to be available for selection as participants in the study. Fourteen of the participants in the sample were female, and nine male.

An inquiry sheet was administered to these students providing biographical information regarding the type and environment of high school attended, Grade 12 results and sex of the participant. Prior to the political changes which came about in South Africa in 1994, education was generally segregated and there were "white" schools, the better of which were designated as Model C schools, and "black" schools, later usually referred to as "formerly disadvantaged" schools. Despite the changes of 1994, the general constitution and character of many of these schools have remained constant. The students were also asked to indicate whether they were intending to teach mathematics specifically upon qualification (they have three majors any one of which they are qualified to teach at FET level, depending upon their preference).

Working with Patton's principle that "if researchers assume that a variable may influence the data they should implement variations" (2002, p. 109), the process for identification of a maximum variation subsample began with the placement of the participants into categories based on the two most obvious variables: gender and race. This subdivision resulted in five fairly homogeneous groupings, three of which were female, and the smallest of which were Female-Indian and Male-white containing one and three participants respectively. These two categories were where the selection process began since they offered little choice in terms of who would be selected. Since there were three female categories and only two male, I decided that two participants would need to be selected from the Male-black category so that the number of female and male participants remained equal.

Thus three men (one English, one isiZulu and one Ndebele) and three women were selected (one Afrikaans, one Sesotho, and one Indian), according to the following selection process. The single participant in the Female-Indian category, Ayesha, qualified for selection into the subsample automatically by virtue of being unique in her category. Since two of the participants in the category Male-white indicated that they had no intention of teaching mathematics upon completion of their studies, they were automatically disqualified from selection into the subsample. That left just one participant, John, in that particular category. The category next in size was Female-black. Here there were four candidates, of which only three were intending to actually teach mathematics. Of these three, one stood out: Thandi had matriculated in a private school in the city. She thus became the third member of the subsample. The remaining two categories were the largest. Of the nine candidates in the Female-white category, all but one were educated in former Model C schools, whether in the city or rural. Since no single participant stood out, random sampling was done in this category and so the fourth participant, Martie, was identified. The final category, Male-black, presented near uniformity in terms of the first two selection criteria- almost all were from disadvantaged rural schools. There were two anomalies: one candidate from a private rural school, and the other from a former Model C school in the city. Since the participant in the Female-black category was from a private school, the second anomaly in the Male-black category, Sipho, presented the better option for variation purposes. Also, the private rural school candidate from the Male-black category had not passed several of the academic modules, including the third year mathematics methodology module, and was therefore not a suitable candidate for the sub-sample: his academic training was incomplete. The sixth candidate, Thabo, was then randomly selected from the conformity of the Male-black rural disadvantaged school group. Table 1 summarises the constitution of the subsample.

Table 1. Distribution according to sex, race, and high school of students in subsample

CODE NAME	SCHOOL ENVIRONMENT: CITY/ RURAL	TYPE OF SCHOOL: FORMERLY MODEL C/ FORMERLY DISADVANTAGED/ PRIVATE	MATRIC MATHEMATICS SYMBOL	INTENTION TO TEACH MATHEMATICS: YES/ NO
Female-white				
Martie	CITY	C	A	Yes
Female-black				
Thandi	CITY	PVT	E	Yes
Female- Indian				
Ayesha	CITY	DISAD	B	Yes
Male-white				
John	CITY	PVT	D	Yes
Male-black				
Thabo	RURAL	DISAD	C	Yes
Sipho	CITY	C	B	Yes

Data Collection: strategies and instruments

Two sets of individual interviews were held with these six students, one before and one after the teaching practicum. Classroom observation was done with them during their teaching practicum in the second term of the school year to strengthen the data collected verbally in the interviews. The questions were thus based on their observation of the student's subject knowledge, teaching-and-learning skills, and nurturing propensities.

Inquiry Sheet

An inquiry sheet was administered to the entire class of Fourth Year mathematics education students at the commencement of their methodology module. The inquiry sheet was a translated and adapted version of a questionnaire created by Beijaard et al in their investigation of "experienced secondary school teachers' current and prior perceptions of their professional identity" (Beijaard et al., 2000, p. 749).

This adapted inquiry sheet had a two-fold purpose. Yin (2006) recommends a "formal case study screening procedure" (p. 115) in a situation where a selection must take place amongst several candidates. The first section of the inquiry sheet supplied biographical data like sex, race (by virtue of surnames) and type of high school, providing the basis for the selection of the subsample. The second purpose of the inquiry sheet and one for which the questionnaire was designed by Beijaard et al, was to "explore the way teachers see themselves as subject matter specialists, didactical specialists and pedagogical specialists" (ibid., p. 749). This purpose was fulfilled in Section 2, which also provided a base for discussion in the initial interviews, as well as a basis of comparison between the students' perceptions of their PMTI and their practical outworking in the classroom. The second section of the inquiry sheet was divided into two parts: the first required the students to indicate their prioritisation of the three aspects professional mathematics teachers, using Beijaard's original terminology: Subject Specialist, Didactics Specialist and Pedagogics Specialist. The meanings of these terms were clearly set out in accordance with the conceptual framework of this study and were also verbally explained to the class prior to administration of the inquiry sheet. This sub-section therefore specifically delved into the way the students saw themselves as teaching professionals. The second part of Section 2 was also adapted to suit this study – it consisted of elucidatory open-ended questions in which the students explained both the reasons for their prioritisation, and how their tertiary contributed to those three aspects of their teaching identity. Here the students were to look at their professional identity through the filter of tertiary training.

Interviews

"We cannot observe feelings, thoughts, and intentions…[nor] how people have organised the world and the meanings they attach to what goes on in the world. We have to ask people questions about those things" (Patton, 2002, p. 341).

Prior to the commencement of the practicum, individual interviews were conducted with each of the sub-sample members. These interviews were semi-structured, and the questions were designed to further clarify and provide depth and insight into the beliefs expressed and explanations given in the inquiry sheet. At the end of the third school term, which brings to an end the long practicum in which the Fourth Year students participate, the sub-sample was again interviewed individually. The semi-structured interviews held at this

point yielded data regarding the overall practicum experience, as well as insights into tendencies and behaviours observed in the videoed lessons. The coded videos of the classroom observations were watched and discussed during the interviews.

Classroom observation

Although the students had quite clearly expressed their ideas about how they teach and who they are as mathematics teachers in the initial interviews, the classroom observations were designed to give insight into theory-in-use as differentiated from espoused theory (Argyris & Schön, 1974; Maxwell, 1996). According to Patton (2002),

> Interviews present the understanding of the people being interviewed…interviewees are always reporting perceptions – selective perceptions…By making their being own perceptions part of the data – a matter of training, discipline, and self-awareness – observers can arrive at a more comprehensive view of the setting being studied… (p. 264)

Two lessons taught by each student were "non-participatively" (Creswell, 2002, p. 200) observed and digitally recorded. The students were not warned in advance of the specific lessons to be recorded, so that their classroom practice would be as natural as possible in what were, by the very nature of observed behaviour, unnatural circumstances. The recordings were also transcribed, coded and analysed.

Analysis

According to Patton (2002), "Qualitative analysis transforms data into findings. No formula exists for that transformation. Guidance, yes. But no direction." (p. 432). The process, he says, "involves reducing the volume of raw information, sifting trivia from significance, identifying significant patterns, and constructing a framework for communicating the essence of what the data reveal" (p. 432). The sifting and pattern-identifying procedures to which Patton refers were carried out in this study by using the data analysis programme, Atlas.ti.

The interviews were digitally recorded and the observations were videoed. These recordings were professionally transcribed, without grammatical corrections or exclusion of ums and other verbal eccentricities. Both deductive and inductive coding was used initially as Open Coding, and then as Code by List: the elements in the conceptual framework were used as broad code subjects, like "Evidence of Understanding" – hence the deductive aspect of the coding; then a variety of sub- codes were created, drawn from what was said – hence the inductive aspect. For the initial interviews (prior to the teaching practica) fifty six codes were generated, for the second interview set, seventy seven, and for the videos as for the inquiry sheet data, twenty three. The number of codes created was a function of the desire to code even nuances of meaning. According to Denzin and Lincoln (2003), coding serves two purposes: "First, codes act as *tags* to mark off text in a corpus for later retrieval or indexing... Second, codes act as *values* assigned to fixed units" (p. 277). Both purposes were used in this study, which is why the data was 'code-saturated'.

RESULTS OF THE STUDY

The strongest influence for most of them lay in their personal background, even if this was not explicit in the discussions with them. The statements in the table below were not made by any of the students, per se, but are rather an interpretation of the information they imparted across the various communications with them. Each statement draws together the dominant element of the student's biography with the dominant element in the actualisation of the student's PMTI.

Table 3: Biographical influencers: implicit statements

Implicit statement	Student
My teacher could not explain - I must explain	Martie
My father reminded me of the requirements of my culture – I must teach so that I can be available to my own children one day	Ayesha
My teacher had authority – I must teach so that I have a position of authority	Thandi
My teacher was often absent – I taught and liked it	Thabo
I was shy and retiring at school – I must reach out and draw learners out of themselves	John
My teacher was racist – I must treat all cultures and languages equally	Sipho

When Martie was at school, she found that her mathematics teacher was someone who struggled to explain a concept. Martie retaught what he had tried to teach and derived great satisfaction from it. Martie is seen to teach with great enthusiasm and passion, and to be an 'explainer' – one who seeks to impart understanding of the mathematics concept in question. Ayesha wanted to be a veterinary surgeon, but was dissuaded by her

father who reminded her of the duties of a wife and mother of her culture. In Ayesha's classroom practice she is seen to be a traditionalist teacher who teaches for learner achievement by emphasising procedure. Thandi holds herself aloof from her learners – her interaction with them is limited to one direction only: she imparts knowledge to them. Thabo's most vivid recollection of his schooling is of being given the opportunity to teach in the absence of his mathematics teacher: as a learner he excelled in the subject, and loved actually teaching it. When Thabo is standing in front of a class, his joy in both the subject and the teaching thereof is patently visible. John says he was a shy and reticent boy while at school, not drawn out of his shell by his teachers. The one aspect of John's PMTI that stands out in everything he says and does, is that he values relationships and strives to reach out to his learners on an emotional level. Sipho walks around the class, pausing to talk and laugh with individuals everywhere. He goes out of his way to show the learners that he values each one as an individual. It is thus a finding of this research, in corroboration of the literature studied, that PMTI is influenced by elements related to specific contexts, and particularly by schooling experiences. In fact, Liljedahl (2002) states that "…the formation of teachers' beliefs about mathematics teaching and learning come from their own experiences as a learner of mathematics" (p. 2).

Of secondary importance in all of their PMTI's were their experiences both at university and during the teaching practica. While each of them developed a deeper understanding of the psychology of learning and teaching, this did not dominate their classroom practice and was mainly evident in what they *said* in the interviews. In this regard, Ball (1988) calls teacher education "a weak intervention" (p. 40), not changing the fact that "are most likely to teach math just as they were taught" (ibid., p. 40). To some extent, the teaching practica allowed them to weigh up what they had learnt in the university lecture hall (i.e. the theory) with what they saw and experienced in the school classroom (i.e. the practice). This is exactly what Feiman-Nemser and Buchmann (1985) called the two-worlds pitfall. For some, like Thabo, this meant that he could choose between these to do what worked for him. Others, like Thandi, claimed they could develop their own teaching style.

The single factor which all six students claimed to recognise within themselves was the desire to "make a difference". They felt that there was that within their PMTI which made them inherently teachers and which received satisfaction from the "aha" moments when learners understood what was being taught. However, this PMTI influencer was found to be less definitive than their contexts.

Their view of the subject mathematics was generally not well verbalised and it would seem that they had given little thought to the notion of what mathematics really was in their understanding.

Perceptions of their PMTI's
Their perceptions of themselves in terms of the three aspects of PMTI which are studied in this research are not necessarily directly in line with what is observed of their classroom practice. These perceptions are held in such a way as to be an intrinsic part of who they think they *are* as teachers, but, paradoxically, not necessarily of what they *do* as teachers.

As subject specialists
Although all six believe that being a Subject Specialist is the foremost aspect of their PMTI, they do not all believe that they in fact *are* such specialists. It would seem that they recognise the importance of this aspect and what its position should be in their PMTI, but they have doubts about their ability to live up to the level of mathematical expertise that the term implies. Ayesha explained as follows: "... I *want* to be a subject specialist; I *want* to know my work." Yet she believes that, because she is able to field learner questions successfully, she in fact *is* a subject specialist. Thandi said almost the same thing: "I *should* be a subject specialist to be able to teach learners good in school. I *should* be well equipped with the subject knowledge that I can pass on to my learners" (emphasis added). However, she found out during the practica that, in this regard, "lots of work is required before one goes to teach in schools..." She felt that her lack of mathematical expertise was a problem because it meant that she had to research each topic before she taught it, but she could also rationalise her lack of expertise by indicating that this meant she was able to identify what was difficult for the learners because it was also difficult for her. Thus, "I can see a good mathematics teacher because I'm still learning mathematics, I'm not a specialist." John also recognises his inadequacies as subject specialist, as testified to by his mentor teacher: "He hasn't come here pretending to know it all. He's come with questions..."

Thabo, however, indicated that he found it easy to teach because he understood the intricacies of what he was teaching. Martie is aware of the emotional aspect associated with the learning and teaching of mathematics: "People in general have this psychological block against, well, mathematics." She, however, loves mathematics and is fully persuaded of her expertise in the subject. Her mentor teacher in fact

repudiated Martie's prioritisation, saying that in fact these three aspects were not on a par in her PMTI – she was predominantly a subject Specialist.

These students attach great value to "knowing your subject". They all seem to believe that a mathematics teacher who is not a subject specialist is not a good teacher. However, the belief that this aspect of PMTI *should* be the most important does not necessarily make it so for the individual.

As teaching-and learning specialists

The six participants all seem to believe in greater or lesser measure that they know how to teach mathematics. They believe that they have the necessary skills and techniques to convey information successfully. Most of them acknowledge the value of university modules in which they learnt about how children learn. None of them mention their lack of experience in this regard. In fact, most of these students referred directly or indirectly to an instinctive knowledge of how to teach. Ayesha went as far as to say that, "One can't really teach someone how to teach, I think it comes to you naturally..."

Martie, who says that her university training added very little if anything to her knowledge base, admits to having acquired different methods for teaching specific topics, which she finds useful because she believes that learners learn in different ways. She therefore has retained within her PMTI the beliefs acquired at school by observing a teacher whose communication of mathematical concepts was not successful, and by teaching her co-learners who did not understand and achieve as well as she did in class. Ayesha sees herself as a natural teacher, but also espouses the notion of repeated explanation to facilitate understanding. Thandi, however, declared that, "You can see the other teacher doing…teaching in this other way and then when you try it and then it won't work for you." The solution lay within her own PMTI: "You have to develop your own way of teaching that the learners would understand..." Thabo's dominant belief is that lessons should be learn-centred, something he learnt about at university. His own schooling was teacher-centred and described by him as boring. Looking back at the teaching style he used as a learner replacing the teacher, he describes himself as boring. John is concerned about boredom too. His dominant belief is in the necessity of creative involvement of the learners in every lesson. Sipho is driven to teach in such a way that the learners are continually encouraged, and so he has adopted a teaching style which can best be described as entertaining. He sees himself as someone who knows and loves his subject and who knows and loves the learners, particularly in view of their cultural diversity, so his PMTI is characterised by these two beliefs and his determination to integrate them.

Generally speaking, all six participants have sustained the effect of their own schooling in this aspect of their PMTI's. They have also, to varying degrees, made some of the theory they learnt about at university, like learner involvement, their own. Added to this are also their own personalities. So, in terms of who they are as teachers, there is an amalgam of these three that has made them who they are at this point as teaching-and-learning specialists.

As nurturers

With the exception of Thandi, all the participants frequently expressed their concern about the learners and their involvement in the lessons, as well as their own involvement with the learners, despite the fact that all (apart from Martie, for whom all three aspects were equal) of them placed this aspect below the others in their prioritisation exercise. There is an awareness among them that mathematics is not universally loved by learners, and is in fact often associated with fear or boredom. There is therefore a noticeable inclination to "make a difference", to involve the learners in an enjoyable way and to help them to experience mathematics as challenging rather than frightening. Martie, for example, recognises that the negative emotions associated with the subject may also be attached to the teacher and does her best to show herself as a continually, smiling, caring, approachable teacher.

John stands out in this regard. He, perhaps because of his own experiences as a quiet, introverted learner at school, is predominantly concerned with reaching out to the learners through relationships, possibly established on the sportsfield rather than in the classroom. Thabo, also concerned about learner-centredness, is driven rather to see the learners understand mathematics the way he does, to see them love the challenge and rise to it. Sipho, denigrated at school because of his colour and despite his mathematical prowess, is determined to 'make right', to treat the learners with respect, to the point of trying to speak their various languages even if they are far removed from his own.

Ayesha and Thandi are somewhat different. Ayesha, while believing that "children are my second passion" and expressing her willingness to be available to them and to help them overcome the learning impedimenta resulting from the fact that "some people are depressed, some people have ADHD and ja...", holds herself aloof from her learners. This may be attributable to the belief that teachers should be moral preceptors and

role models for their learners. Thandi expresses her beliefs regarding nurturing only in theoretical terms: "It is part of every teacher in each and every learning area, even mathematics. Learners are made up of their social space/world." When pressed to explain what this really means to her as a teacher, she goes no further than to say that if someone is sleeping in her class she would want to know why, in case "that someone is dying and I'll be responsible". She expresses no link between the theory of learner involvement and actually caring for the learner.

There is a considerable range of beliefs regarding this aspect of PMTI discernible in this group of students. At the one extreme there is a deep conviction that relationships are the basis for effective teaching (John) and at the other there is the belief that the learners are in the classroom to learn, and that is all (Thandi). In between these two poles is the general belief that teaching should be learner-centred if effective learning is to take place.

Actualisation of their PMTI's

Ayesha has a formal approach to both the subject mathematics and the way it is to be taught, and even tends to be traditional in her presentation of the concepts she is teaching. Martie is also formal in her approach in that she is, by preference procedure and process orientated, while simultaneously being focused on bringing the learners to a point of understanding. Thandi's approach to mathematics in the classroom is defined by the limitations in her subject knowledge: she teaches a concept and then allows the learners to develop it further while they work on the board and even answer questions. This is *not* in fact a form of constructivism in action: she is more at ease with the subject matter in hand when she does not have to present it herself. Thabo is also formal in his approach to mathematics in the classroom; he believes in teaching until understanding is reached, allowing the learners very little leeway for self-motivated discovery. John and Sipho, by contrast, teach by leading the learners to the discovery of the truth that they were intended to find as an outcome of the lesson. Their approach is certainly more constructivist than can be seen in the classroom practice of the other four students.

From a purely visual point of view, these six students present completely differently in the classroom. Martie is friendly and outgoing, smiling frequently and encouraging the learners with gentle laughs and motivational words like "Of course!" and "Nearly there!"; a gentle shake of the head for "no" and a vigorous nod for "yes!" Ayesha maintains a formal distance: she teaches from the front of the class, rarely leaving the space between the teacher's desk and the board. Even the cardboard triangles she was using to illustrate a point were shown to the class from there. Her expression is friendly and her delivery calm and formal. John, by contrast, walks down the aisles of the classroom, engaging the learners by asking them questions and periodically making them laugh with his quirky comments. His delivery is animated and his facial expression is friendly, often lit up with smiles or laughter. Thabo also walks down the aisles in the classroom, despite the fact that his mentor teacher advocated standing in one spot in the front of the classroom, teaching with visible enthusiasm and a smiling face. Thandi, however, smiles not at all, remains in front of the class, or to the side near the door, and teaches with a deadpan expression and voice. She only ventures down the beginnings of the aisles when the learners are writing down sums. Sipho moves all around the class, talking in an animated way and gesturing with his hands. He frequently bends over a learner's desk talking briefly to individuals here and there as he is teaching, not just when the learners are writing.

There are a number of techniques that these six students use to determine whether their learners have understood the work or not. Thabo, for example is conscious of the class atmosphere: "the excitement, also the excitement in the classroom would show you that they're they…they…they do understand the concept, they have grasped the concept." Most of the students however believe that body language is one of the most obvious indicators of understanding: Thandi explains, for example, "I read their faces if they understand, they're with me or if they're just lost..." All six of these students were very much aware of the need to find evidence of understanding of the concepts they are teaching. They use a variety of strategies to find such evidence, ranging from the observation of the learners' body language to how their homework is done. However, in some cases the strategy seems more theoretical than practiced: Thandi, for example, at no point in the observations returned to a learner to see if his answer was correct; Ayesha, while receiving chorus answers to her questions did not actually react to the fact that probably half the class did not respond positively at all to her questions.

While these students have a strong sense of the 'rightness' of a learner-centred classroom, their interpretation of the concept varies dramatically. John, for example, believes in involving the learners through every step of the lesson, while Thandi believes her lesson is learner-centred if she gives the learners the opportunity to write sums on the board. For Ayesha, allowing the learners more scope in the class for participation means discipline problems – for Sipho that is no concern at all. Thabo's own reserved nature makes it difficult for

him to bring about the learner-centredness in which he says he believes; while Martie has no such difficulties – her friendly and outgoing personality invites enthusiastic responses from the learners.

The students showed varying levels of flexibility in their classroom practice. For Martie and Thabo, planning allows them to be flexible in the sense of not being 'caught unawares' by challenging learners. John and Sipho plan for deviation from the lesson plan: they believe that a lesson plan provides structure, but not rigidity and they leave space to manoeuvre both for themselves and their learners in terms of the lesson plan. Ayesha and Thandi do not readily deviate in any way from their lesson plan: Ayesha because she needs to keep all the learners busy all the time for discipline reasons and Thandi because deviation from the plan would literally mean venturing into the unknown.

The pastoral role which the South African education department requires that teachers fulfil is subject to interpretation as to what its practical outworking may be. To one of the students in this study it means simply being approachable as she stands next to the learner's desk and looks at his mathematics exercise book. To another, it means counselling a learner, if called upon to do so, in terms of the issues in his life that may or may not have anything to do with the classroom. Sipho, for example, strives to overcome barriers based on language and colour differences, while Thabo tries to encourage his learners consistently. John believes firmly in the value of establishing relationships; he says it makes teaching and learning easier because the learners are willing to "engage". Thandi however does not believe in the establishment of relationships at all: "No, I don't. No, I don't, just be professional and approachable and then learners will be able to approach you... relationships, no." In her opinion such relationships can too easily be interpreted as favouritism.

CONCLUSION

What has become particularly evident to me in this cross-case analysis is how very closely linked the students' PMTI's are with their own personalities. Martie is cheerful and outgoing – she teaches with warmth and confidence; Ayesha is somewhat more reserved and teaches in a formal way; Thandi is sure of herself and quite determined to do things her way – she teaches without involvement with her learners; John is warm and caring and reaches out to his learners during every stage of the lesson; Thabo is quiet and reserved – he teaches with calm confidence; Sipho has an enthusiastic and effervescent personality and his classroom is a stage for him and his learners to engage actively in the work at hand.

However, the most striking finding is the discrepancy between these students' perceptions of their PMTI and its realisation in the classroom. While certain of these students say they *are* something which in fact they are *not*; others say they are definitely *not* something, which in fact they *are*. This mismatch within their own PMTI's is not evidenced by any apparent internal conflict. Where Beijaard et al. (2000) assumed that "teachers' perceptions of their professional identity reflect their personal knowledge of this identity" (p. 750), it is possible that the incongruence of these students' PMTI perceptions and the reality of their actualisation may be attributed to their *not* having "personal knowledge of this identity". Possible explanations for this lie within their inexperience: they have had very little opportunity to test the robustness of who they think they are against who they *actually* are in the classroom; they have acquired neither the habit nor the skills of true reflection.

These students thus demonstrate that while they may certainly be teaching who they are, this is not necessarily who they *think* they are. They may believe that they are subject specialists, teaching-and-learning specialists and nurturers, but when they are observed at work in the classroom these specialisations are not necessarily, or at least not consistently evident. There were six participants in this case study: each one holds their own beliefs in a unique way, and each one actualises their PMTI in a unique way. Six disparate PMTI's were examined, with very little commonality to be seen between them. It seems possible that were more students' PMTI's studied, so many more unique PMTI's would be discovered.

It was never the aim of this study to generalise its findings. The objective was to describe the PMTI of students in their final year of mathematics teacher training at UP. No single, common PMTI could be identified. However, PMTI *does* exist in these young students. Each student, unique in their background, way of thinking and ambitions, evinced a distinctive PMTI. The principal finding is that the actualisation in the classroom of this PMTI is not necessarily congruent with what the person believes to be their PMTI.

PMTI merits further study as it may, in a longitudinal study, become a predictor of the longevity in terms of career of a mathematics teacher in South Africa, as well as of the effect of changes in the curriculum: pre-service teachers are more comfortable with concepts they learnt and worked with at school than with those they dealt with at university. Therefore, if, when they return to school as teachers, only to teach new material not dealt with while they were still learners, uncertainty is n the classroom can result, as Thandi demonstrates.

142 - Brazilian University and National Network of Continuing Education of Teachers: Boundaries and Advances to Professional Development

Diego Jorge Ferreira

The Universidade Federalm Fluminense, Niterói city, Brazil
diegojorge@gmail.com

Abstract: In the field related to teachers' education it is consensual that their knowledge permanent refreshment. The technical-instrumental model is the most spread in the institutions that educate teachers. Most times, them leave their basic education courses instrumentalized to face a complex reality. Therefore, the pre-established formulas repetition does not offer the teacher the possibility of thinking creatively. Whether it be this and other reasons, it is possible to detach specific university sectors that the states governments, alike the federal, have brought the university to, since it is the center of the elaboration of permanent education courses in Brazil, through the elaboration of the National Network of Continuing Education of Teachers. It is justified, somehow, the focus in the university as the ability of its proposal capacity and the educational professional development, where not only some advances were detected, but also the need for adjustments.

Key-Words -continuing education of teachers – university - professional development

INTRODUCTION

In Brazil, and in all the world, the university is a reference. This institution is known by its capability of allying itself to the needs of the productive sector. People, in general, expect to receive and enjoy high leveled undergraduate degrees. Public power sees the university as a partner in the development of solutions to various issues. Also, in the educational area it is expected to observe the qualitative effects of the academic work. One of the possible ways is to prepare the basic education teacher. Regarding that, it is mandatory that the education for the teachers of beginning grades is offered by colleges, also considering the necessary adjustments and regional inequalities. The Brazilian reality, in this field, leaves to the continuing education of teachers great challenges and adjustments to be made. In addition to that, hope in relation to the capability of answer of the universities to the issues of the Brazilian society. Public power expects to improve education and the teachers wish they would have more autonomy and professional valuation. Some studies show that in order to achieve their goals, teachers and public power must follow particular ways and invest on continuing education. In 2003, the Brazilian Education Ministry pointed the university as a privileged location to this task. The National Network of Continuing Education of Teachers was created. They headed the elaboration of teachers' training courses together with the Education Secretaries. Before the existence of the National Network, either the universities or actors related to it were, almost always, engaged to it in order to conceive the greatest part of the "capacitation in duty". Many studies have shown that, in that phase, it was necessary to review the current roles. In general, the educative actions were sporadical, uncontinued and disconnected to the career increasement plans. There was not the concern with the impacts or education both in the students' education and in the teachers' professional lives. Facing these limitations, we ask: Which advances and/ or advantages would be present in the institutionalization of the brazilian continuing education starting from the National Network of Continuing Education of Teachers? Which are the conceptions, dimensions and role models adopted? Which are the possibilities and boundaries to students' education and valuement of the teaching professional? What do coordination and teachers' educators say? Can we say that the possibilities of success exist and will be stronger in the proportion that the studies of teachers' education, mostly directed by the university, are taken advantage of so that the adjustments needed to the continuing education are put into practice? If the facility of the National Network of Continuing Education of Teachers makes a review, headed by the university, of its hierarchical culture and disarticulation, at least in this field, we are positive that great advances, both pedagogical and professional, will be achieved to the studying teachers and their students. Otherwise, all the hope won't be justified in relation to the university, especially on the point of elaboration and execution of continuing education.

THE HOPES AROUND THE UNIVERSITY

There is a group of authors that, either agreeing or disagreeing in their concepts on the university, mostly, defend it as a critics, innovation, research and, even, social changes area. They also claim the reorganization of this space in ways to provide the social demands that are in the agenda.

It is on us, though, to verify if the indications directed to the universities are converted into effective actions aiming the social well-being, and, in the case of this study, into continuing educational programs for teachers. Throughout the discourse there will be a tendency to overwhelm the university as a potencial spreader of elements, that, together with the ones who have been through it, will bring the possibility of social justification. The criticism defends whichever paths that lead to reach specific objectives to the university, to the society, in general, therefore, to the education, the school and the students. The post-criticism defends a look of the university to its internal and external problems, to the way of how to organize itself in relation to them. It focuses on the increasement of the institutional relations in the university and its relation with public institutions and with the people itself.

According to Chauí (2003) the public university shouldn't put itself in an underwhelmed position in relation to the great capital, in opposition, it should stand up against the exclusion caused by the neoliberalism and the globalization; to the author, the universitarian authonomy cannot be restricted to the so-called "management contracts", relating to the right of the university to define its path in relation to schooling, research and extension.

Luckesi et al. (2005) reject the possibility of a university-school and defend the research as a formative principle and the university as a privilege *locus* to the people's education. Thus, it is important to understand that the professionals majored there, have, in thesis, a reflexive criticism capacity. We understand that the conviction of these authors is that the expression of the social commitments focused on the valorization of science as a tool for social and intellectual freedom of the society.

As expressed above it is possible to realize a positive perception in relation to the university, meaning that there is a faith in the social importance and relevance of this institution. This fact reveals, conceptually, the importance of the universities as an articulatory location between the social and political criticism and the population, not only to make their social and economic conditions clear, but also aiming the masterization of interpretive societies and to permanent learning.

In the group of responsibilities attributed to the universities is the teachers' education and its professional development. The questioning capacity relies in the university and it is hoped that it uses its knowledges in a systemic relation with the schooling webs, and, consequently, with the teachers. Thus, starting from the formative actions, the improvement of the teachers' professional development is expected and supposes the consideration of a group of characteristics, among which are the following.

A group of authors (Contreras, 2002; Day, 2001; Pacheco e Flores, 1999) defends a specific professional thrust to teaching. By valorizing the teaching professional it should contemplate the educators, in the educational programs, the statements that are in favor of the confirmation of that thrust. In the Brazilian case, would the university be the privileged location to this end? Taking the theoretical defense (Guimarães, 2001) and the choices made by public power into consideration, we would have a positive answer to the presented questioning. Our effort, beyond discussing the flexibilization of the isolation and the university hierarchization, will be to evaluate some attitudes of the National Network of Continuing Education of Teachers. Having its construction based on public statement, offered by the Brazilian federal government, by Research and Extension Centers, it defends improvements in the establishment of partnerships or team planning, internally or externally, in favor of the good educational practices of teaching. Taking advantage of the former experience of the then called Centers of Excellence in Research and Extension, it announces their goal of valorizing and professionally developing the Brazilian teaching through the Web in concern.

TEACHERS, WORK AND PROFESSIONAL DEVELOPMENT

In the definition of what the thrust is, what characterizes the teaching professional spreads on many parallel perspectives. This way, we have opted for some of these arguments that, in general, bring criticism on the current situation of the teaching profession. Although some studies have not been developed in Brazil, they are applied to its reality, and, obviously, to the teachers in this country.

In the description of the teaching profession we have found specific definitions. The consideration on them infers a professional *status* to teaching. This is important since it denies that the character of the teaching activity is more relevant, comparing to liberal classic professions, such as: law, medicine and engineering. The fact of considering these specifities is fundamental if an educational program wants to be identified as focused on the professional development of teaching. On the other hand, remains the consideration that this kind of activity is almost a profession, meaning that teaching techniques to reach particular goals would be

enough. The fact is that these professional, traditional and pragmatic marks do not include intellectual, critics and creative character to the teaching labor.

Christopher Day (2001) understands that the teachers' professional development depends on their personal, professional and political lives not to mention their school contexts. To this author, the investigative capacity is an element that is connected to the teaching professional. This is the reason why he defends education as a method to professional development (Day, 2001). In Brazil, the beginning education is, systematically, claimed as insufficient to the teachers who work with the first years of fundamental education. With the definition of Pedagogy Courses as responsible for educate masters to this teaching level, there is hope of improvement in this field. However, having so much to be done and maintaining the high-school education as the minimum allowed, it is left for the current education the offer for what may have lacked in the previous professional education step. We agree with the author on the reference of his perception that both agreements must cause a mobilization among teachers, schools and government in favor of the continuing education of teachers, and, consequently, their professional education with all the advantages that it may bring together. The non-performation of these actions would be in favor of, defines the author, a mass of professionals whose creative capacity would be restricted (Day, 2001). This way, the teachers close themselves in the classroom world; he neither reads, nor researches, nor worries about his teaching professional development. Programs concerning the teaching professional development stimulate us to a "sensible capacity being able to increase through investigation and formative activities, especially those which infer extense study" (Hoyle, 1980, apud Day, 2001, p. 22).

To Contreras (2002), professional development implies authonomy rescue in one's job, in making their minds as a critic and authonomic intellectual. To the author, adding to Christopher Day's statements, sometimes there are reading days when teachers are reached by a 'teaching proletarization'. The author's fundamental statement is that the teaching work has suffered an increasing withdrawal of a series of qualities that have lead to the loss of control and of the sense of their own job, that is, the loss of authonomy. This way, contributing to teaching professional development would be in order to recover their authonomy, which is mostly related to their intellectual and managing capacity linked to the education; they somehow add to students. Finally, the analyzed courses in this study should get closer to this perspective, and the exercise of the questioning capacity of the university, supported by the managing and enthusiastic agencies, should include the indications of the quoted researcher.

THE NATIONAL NETWORK OF CONTINUING EDUCATION OF TEACHERS

Institutionalizations, renewed hope. This feeling got stronger in 2003 with the creation of the Brazilian National Network of Continuing Education of Teachers[36]. Too late, since England, Portugal and France (Menezes, 1996) made these actions systematic throughout the 80's and 90's last century, already important.

The Brazilian Network, focused on the education in favor of public education teachers, was launched in 2003 with neither facilities nor a headquarter. The Network is, at some point, virtual. The research centers already existed. They were located in the Network and are found in the university rooms to which they are connected. The courses are offered in the most varied locations, with diversified facilities, whenever they are presencial, but the infra structure is not always adequate. They may happen in university or school classrooms, auditories and/ or Secretary complexes, etc. Anyway, the foundation of this Web does not refer to the creation of new spaces. We could not find any planning with this aim. The Web is settled in the universities and it could be considered an appendix of it. Through a public statement were elected 20 Study Centers, distributed the following way: literatization and language (6 centers); mathematics and scientific education (5 centers); human and social sciences (3 centers); arts and physical education (3 centers); management and evaluation of education (3 centers). To these Centers of Research and Development of Education, the Ministry of Education (MEC) has established a budget fund so that courses would be structured and didactic material destined to the continuing education of basic education teachers, which, in Brazil starts at nursery school and goes until high school. The greatness of the tasks and of the responsibilities do not match the, virtual, Web's.

The MEC's (Brasil, 2005, 2006a) document about the Web expresses the desire that those Centers are articulated among themselves not to mention with the undergraduate education institutions (IES) to the production, as we have already described, of didactic material to distance and semipresencial courses. The Web must act by supporting the needs and demands of the schooling webs. These ones, though, must look for Research Centers. Among other challenges, like the theoretical-practical refreshment of the teachers, target of the courses, is the valorization of the teachers in their professional experience.

---

[36] Most of the times in the text, I will just use "**Web**".

This way, two main topics are essential to the progression of this writing. Regarding social hope and public power, in relation to the university, the questioning would be about the affection in actions in order to improve the internal and external articulatory relation to the continuing education of teachers in analysis and to what is was made. The second questioning, and not less important for its position, is about the teaching professional development. The analysis of documents and interviews were tools used to embrace data related to our matters.

UNIVERSITY: EFFECTIVE QUESTIONING EXERCISE?

We have analyzed two experiences of partnership between universities and public agencies holding the Teachers' Continuing Education National Web. One of the Partnerships is referred to the first phase of the Web. At that time, it would produce not only courses but also didactic material that would be sold to the webs. This experience will be called Partnership **1** and it evolves a university and the metropolitan City Hall of Rio de Janeiro. The second experience will be called Partnership **2** and it embraces two universities and the metropolitan City Hall of Rio de Janeiro. Both these partnerships were selected for having being large-reachness actions together with the studying[37] teachers. Obviously, the concern of those courses was the continuing education of teachers.

This work, in other aspects, tries to evaluate the questioning capacity of the universities in the field of continuing education of teachers, based on interviews made with members of the Universities, Secretaries and with the teachers' educators that were part of the university teams, making a total of 21 interviews. Still, we have analyzed the base-documents to the Web, starting from what we confronted with the objectives described as effective practice, starting from the perception of the interviewees. Does the university assure its questioning capacity? Which contributions have they brought to the teaching professional development?

One of the principles or major objectives that show our attention in the base-document of the Web in analysis refers to the necessary articulation of the university internally and externally in favor of this education and to the steps accomplished in duty. By working this way, the university would find its path to an ideal questioning exercise. It would be taken advantage of the outgoing tradition in research, teaching and extension. The knowledges produced by these experiences would give opportunities to better laboratorial results to the masters, and, consequently, would improve the educational systems. What is observed in the case of the universities is that there is some tradition in these areas, yet, articulation is something that if exists is just too little. When there is some experience of articulation between groups of research and extension – throughout courses offered to public school teachers, for instance – they are not enough and reach very few teachers.

By facing what has already been exposed, we consider that the National Network of Continuing Education is an advance since it is composed by research and extension groups, almost always recognized in the permanent education of teachers of their respective areas. This may be the reason for that the manager of the secretary connected to Partnership 1 while talking about some other experience of education developed by the city educational web, considers that with the support of the university, teachers can be more connected and may present a change in the profile of their practices. To the manager of Partnership 2, the presence of the university is a fundamental element focusing on its scientific production. Here, and in some other parts, it is possible to identify arguments that lead to hopes and credit deposited on the spot-lighted institution, situation we have described at the beginning of this essay.

The favorable positions to the compounding institutions in the Web[38] are not unanimous. The funders of Partnership 1, have mostly shown criticism in relation to the behavior of the undergraduate and graduate institutions. In the understanding of one of its components "the university must be more committed (…) more than it already is" She claims the social commitment is one of the obligations of the institution and defends that for it to do so, the extension activities must be intensified.

The components of Partnership 2 show that the university has a number of possibilities and it can act in a diversified way. Among the cited possibilities is the one about the proximity of the schools, which does not occur in most parts of the Web. In the courses we have accompanied such practice does not exist. Furthermore, the articulation with the Secretaries, with the schools and with the teachers is something that could happen. Here, in the first analysis part we were able to verify the deposit of a great amount of hopes in the Centers of Research participating in the Web, which is a reflex of those wishes to which we referred at

---

[37] Partnership 1 has gratuated 32 teachers to na adult literation program of the federal government and was, therefore, enabled all over Brazil; Partnership 2 had 400 teachers, of the city schooling system, split in 10 groups as a target.
[38] Of the coordinators of the courses.

the beginning of this writing (Guimarães, 2001; Chauí, 2003; Luckesi et al., 2005), to finally, notice the existing difficulties and contradictions. However, there are other incoherences.

From both parts, the Universities and the Secretaries, it is manifested the importance in the articulation and collectiveness in the formative practices, in its conception and practice. The proof for that is the admission, by the university, that the Secretaries are more than sponsors for courses. In opposition, the indications of the base-document of the National Network, that preaches the articulation among the institutions and the courses offered by the webs, are mostly composed by closed packets. There is, though, a subjective contradiction in the documents. Articulation is demanded by the components, nevertheless, there is no time, there are no facilities, there is no plan, and there is no enough systematization. Without a dialog tradition, with neither money, nor time, its questioning capacity is not practiced by the course organizers. They might submit themselves to MEC's demands or the employee's teaching systems, which may happen via Web or not.

In most cases the centers selected by MEC have the practice of offering courses to the nearby webs. This way, they have built a group of courses and experiences in the area, negotiated, in a loose way, with the city halls and state governments. Despite this experience, as soon as they were recognized by the Web, the Research Centers have not built a systematic and continuing consultant and/ or interaction practice with the teaching webs. In opposition to Chauí's (2003) indications, the university tends much more to offer services, in a merchant view, than to be prone to social. It is mandatory the reorganization in the Web's plan; the calculations for investments are related to the production of didactic material and continuing education of teachers courses, which has favored or reinforced this image of service counter, especially related to the extension (Demo, 1996). This way, the demands from MEC that the Web articulates itself with the external components in order to build the courses would make the idea of a service counter more distant, since its reference referred to the university is not positive. To do so it is necessary a greater investment on the Web or an articulated plan in the MEC areas in order to provide the need for hiring people so as to embrace such requests. There should be, in case of any declaration of whichever intention, the foresee of financial, material and human resources needs in order to follow a Web that valorizes and potencializes the questioning capacity of the university, which is, until this very moment, under valorized.

The presented practices, testimonials and interpretations make us realize the boundaries imposed to the questioning capacity of the universities, in our case, to the follow-up of good practices of continuing education of teachers (Tardif, 2008). In the boundaries, we have watched the defer of the screaming objectives focused on the professional development, which is, in the Brazilian case, a mistake. It is great the number of shallow teachers; they have multiple journeys of hard work added to low wages; great under stimulation plus material uninvestment of the public schooling system; many want to switch teaching into more valorized professions socially and financially; finally, the most capable young adults choose other careers. Tell me whether the education of the teaching professional is lead to another step, which is not this one. The half-committed plans, kind-of-critics actions, ignore and contribute to the under valorization of teaching and its consequent unprofessionalization.

In conflict with the described difficulties are the objectives of one of the studied Partnerships, in this case, the second one. First, there is the objective of some advance in the adjustments of the basic education of teachers. In sequence, with other plausible intentions: improvement of the teachers' practices; installment of the continuing education of teachers culture; incentive and rethinking of teachers; start a non-stop process of continuing education of teachers with universities, Secretaries of Education and public schools, etc. The pointed goals are common and repetitive, when referring to the proposition of intentions of courses, projects or wishful programs of continuing education of teachers. At last, they end up not producing the desired effect in relation to the difficulties that, at least partially, we have referred to so far. It is though hoping we can still discuss, at least a little, the matter of the teachers' professional development, that we highlight the objectives focusing on this matter.

PROFESSIONAL DEVELOPMENT: PRESENT ELEMENT?

If the full planning, by the university, is something related to the expression of its questioning capacity, the participation of teachers in the elaboration of formative programs of the Web is connected to his professional development. It is justified by the possibility of developing his unrestricted professionality (Contreras, 2002). As there have not been advances in the participation area, it is not possible to state, maintaining syntony with our references, proximity of the Web to those theoretical principles.

Along "good" explanations on inclusion of the teachers in the elaboration of the proposals, some practices in the Web are revealed. To the coordinator of the Partnership 1, "this is very difficult to be done, especially when there are diversified theoretical targets". According to this interviewee, some contributions were incorporated throughout the course. There is, in our understanding, a poor enrichness since the embraced

contributions are not the ones, for instance, made quite clear by the coordinator, that differ theoretically from what had already been established. In the case of Partnership 2, the participation of the studying teacher, when exists, occurs in the meetings, meaning that the level of participation is superficial. The participation of the Secretary is on a pre-selected level, which is allowed in the universities. "In the case of the National Web, the courses are ready and the Secretaries of Education choose them according to their will" (coordinator of Partnership 2).

Not listening to teachers and justifying this fact by not having the deals with the Secretaries highlights the priorities of the National Network unities. You can feel free to make possible analysis taking this data into consideration. In what is related to professional development, it is possible to conclude, thinking of teaching participation, that the settings of this Web do not contribute to the development of its moral obligation, its critics thinking, its professionality. Participation and power of decision over formative paths of profession and of one's own profession are elements that are related to the professional development of teachers. If their participation does not exist in the elaboration of courses, being them the ones that are part of the Web or the ones existing outside it, there is no contribution and this would be a prior indicator leading to the valorization of the teaching career through the Partnerships in analysis and others. In the interviews, the importance of the participation of teachers is in the discourse of universities and of the Secretaries of Education is considered number two and/ or disappears when there is the threat of closing a Partnership. At this point, the recommendation is denied, already referred by Chauí (2003). Let us say no to the merchantilization of the university, no to the purchase of the continuing education as a product to be sold.

Another characteristic that is related to the settings of a professional improvement would be the favoring of the critics and research manifestations of reality. In the analyzed courses, the enrolling teachers were subjected to criteria demanded from the Secretary of Education. They have opted to enroll. The ones who did not show up at the courses either because they have chosen not to or because they were not in the criteria, were under pressure to use the methods taught in the course. There, dies the chance of critics and research manifestations, which are restricted, spied on and controlled. The teacher is constantly remodeled. The obligation of taking part in the courses is indirect, in spite of not having vacancy for all the previously subscribed. In their speech, they may even use the teaching methods that their own experiences have helped build. In practice, the non-use of the offered training is a mark of trouble in the working environment. It is not possible to imagine the possibility of critics and research manifestations in the school, since the experience is unprestiged and the right of choice on the professional path is fake. In the Web, the concern with the offer of critical content, focused on the characteristics of a researcher is frail, or worse, inexistent.

Other aspect related to the teaching professional development is related to their intellectuality. A work in this sense supposes what has been said in the previous paragraph and more. It supposes standing up for their references (Day, 2001:21), the stimulus to the unrestricted professionality. This means incentive to reading, to permanent education, to participation in research groups. It seems that the reachness of these characteristics embraces, also as the last author indicates, the establishment of multiple deals among the public agencies. It does not seem to us that the offering of spare, sporadic and discontinuing courses, that do not include a systematic dynamics of inter institutional planning in which the university contacts with its internal and external partners, contributes to the cited perspective.

The insistence on the taught of teaching techniques is a characteristic of the analyzed courses. A simple analysis of the didactic material (MEC, 2007a) used in the courses, is enough for what we have said at the beginning of this paragraph. This way, we hope that the teacher, by the end of the course, is able to "understand and valorize the written culture" (idem, ibid, p.16); "master the writing system" (idem, ibid, p.24); "develop puzzling capacity" (idem, ibid, p. 40). Here, we criticize the repetitive discourse of a critics and reflexive perspective that is not set as an effective practice in the education program. In relation to the instructors, on duty teachers' educators, the objectives are practical and focused on the resolution of those problems identified as issues to assimilation, regarding the students, and on the contents of Portuguese and/ or Mathematics (MEC, 2007b, p. 23). We state our perception that the Partnerships partially hold a utilitarian character.

In the other Partnership, the stimulus to reading was intense, but of books related to the theoretical conception of the course, constructivism. For good literators, reading habits are possible consequences, starting from this stimulus, even though reading is not the only stimulation component to intellectuality, once again, we notice the lack of attention to the teaching professional development. Considering the stimulus in this case, we can consider it an advance regarding formative practices. In general, even with the pointed critics it is congratulatory the effort of all the evolved teams with the Web. What we want, from now on, is stimulate the debate of the current practices, not disqualify them. Let us remember that most times the courses are what the public managers, through either MEC or the Secretaries of Education demand. Thus, the

responsibility should not be the universities'. It must weight on it, but also on the public systems, on the teachers, on the society. May be the last to harvest the greatest benefits of the deals on which that can be established, the high way we hope from the university, from the public power, from the universities, from the schools, from the teachers; from the height of need that out outrageously stratified Brazilian society. All that supposes the valorization of being a teacher, leadership and social, professional and/ or financial recognition of the teaching professional and potential social modifier.

CONCLUSION

The starring of the National Network of Continuing Education in Brazil was, absolutely, an advance where the non systematization, free and/ or unattached actions, sporadic and discontinuing was set. Starting from this point, hopes have been renewed in relation to the questioning capacity of the university, in the focused field, and in relation to the teaching professional development. We celebrate, then, some systematization[39] in the focused field, keeping in mind that some adjustments are needed.

The university is definitely qualified, but it needs, beforehand an example of what the official documents recommend, of articulation, internally, with the Secretaries, with the schools and with the teachers, so that, in a group effort, issues are debated and rethought in order to build and implement actions. We have to admit that it depends on strategic and financial planning regarding the federal government, not to mention the constitution of a facilities and human resources web, in such an amount that it would celebrate the partnerships among the universities and the basic education schools. MEC has stimulated the articulations of the institutions that are connected to the teachers, not predicting systematic resources for this end. Some argumentation is left when focusing the formative teaching deficiency leading to the explanation of few of the many ills of the Brazilian public education, when, there is a variety of problems to face. Today, we fight for the establishment of 7% of the Brazilian PIB (Internal Raw Production) as a percentage to be applied on national education[40], but we do not have any guarantee that it may happen with the urgency that the educational inequality demands in the country. Therefore, a lot more is needed: more sponsors, collective planning, quality actions and systematic evaluation.

Facing the implemented efforts, the dispended resources and the evolved people, it is not possible to claim there is some inoperance of the university in relation to teachers' education. We may not disconsider the importance of the National Network of Continuing Education of Teachers, that, as mentioned before, was not meant to be disqualified, but simply problematized. We believe the significative capacity of the university will be problematized when the formative experiences are open to collective evaluation, support and impact analysis construction. This is not a complete reality, even with the starring of the national education system currently used. Overcoming the fragments and disarticulation that have stained the continuing education of teachers is still a challenge that both the universities and the Ministry of Education will have to face.

147 - Social Representations of Teachers about Teaching: Professional Dimensions

Rita de Cássia de Alcântara Braúna[1] and Anna Carolina de Lazzari Reis[2]

Federal University of Viçosa – Brazil
[1]rbrauna@ufv.br, [2]carolinareis84@hotmail.com

Abstract: The present article is part of a master's degree dissertation developed in a Brazilian public university, whose main goal is to analyze the social representations of elementary school teachers about "being a teacher", to understand teacher professional identity which are built over the professional career. Thus, our specific objective is to analyze the representations of these teachers about their profession, relating them to professionalism. Therefore, the qualitative approach was prioritized in this work. A questionnaire and a semi structured interview were the data collection tools used in this research. In agreement with research works carried out in Latin America, we observed the simultaneous presence of pre-rational and rational elements in the social representations of the teachers who participated in this study, in relation to "being a teacher", indicating the construction of a professional identity still strongly affected by the vocational aspect.

Keywords: professional development, social representations, professionalism.

INTRODUCTION

The present article is part of a master's degree dissertation developed in a Brazilian public university, whose main goal is to analyze the social representations of elementary school teachers about "being a teacher", to understand teacher professional identity which are built during their professional practice. Thus, our specific objective is to analyze the representations of these teachers about their profession, relating them to professionalism.

In this vein, we understand that many social, economic and cultural changes have occurred in our society, affecting schools and teachers. Such changes occurred mainly in the education system, affecting the work of elementary school teachers, and can be considered a "background" of the development of this profession and of the struggle for a new teacher's identity. Several factors that led to these changes and made teachers feel uncomfortable have been observed.

For some authors, "existe siempre una distancia entre la imagen ideal que los docentes se hacen de su vocación y de su función, y la realidad de su práctica, a menudo decepcionante, dado el estado de los alumnos y de la sociedad" (Dubet & Duru-Bellat, 2000 as cited in Fanfani, 2007). More than that, we also observed that, in general, society has unrealistic expectations about school (Fanfani, 2008).

However, besides the contribution of the changes previously mentioned for teachers' social maladjustment, there are some historical factors, occurred from the second half of the nineteenth century, which are very important to understand the ambiguity of teachers' statute. According to Nóvoa (1999), in this period, there was an intermediate imagery of teacher, since they were seen as individuals that belonged to several conditions, in other words,

> they are not bourgeois, but are not common people; they are not intellectuals, but hold a great amount of knowledge; they are not wealthy people, but have an important influence on communities; they must maintain relationships with all social groups, without privileging any of them; they cannot live under miserable conditions, but they should avoid ostentation; they cannot work independently, but it is useful for them to enjoy some autonomy; etc. (Nóvoa, 1999, p. 18).

Many functions are assigned to schools and teachers; the resources supplied to them are not enough to allow the development of their responsibility for providing education and being a multifunctional institution. Thus, the consequence of this relationship is disappointment and disenchantment with schools and a deep sense of unease among teachers, who perceive that they cannot meet these demands (Fanfani, 2007).

Esteve (1999) and Fanfani (2008) indicate many factors to relate such dilemmas, tensions and the unease experienced by teachers with the present social transformations. The changes have contributed for the maladjustment of teachers in their profession, since present teaching practice differs from the teaching

practice performed twenty years ago (Esteve, 1999). For Fanfani (2008), the new working conditions and the issue of professionalism are keys for understanding this mismatch. Society's expectations about school and the work of teachers make them feel devalued because of the lack of commitment and incentives by government.

These undefined functions of teachers make their identity and its sense more uncertain. Due to their multiple tasks, teachers find it difficult to define and limit objectives and priorities in their professional activities, which leads to the occurrence of the famous "identity crisis" experienced nowadays by teachers (Abraham, 1988; Cole, 1985; Esteve, 1991; Maceda, 1994; Teodoro, 1992; & Vila, 1988).

Therefore, there is not a limited field in the teaching practice for its own occupations and functions, differently from many professions. Many times teaching is not even classified as a profession, in other words, it is recognized as an occupation (Tardif, Lessard, & Gauthier, 2001).

Besides, the increased number of teachers hired at a temporary basis in Brazil, usually under poor work conditions, deserves special attention. In this context, the wage policy of the public sector is marked by different and flexible measures. Thus, the types of work of teachers differ, according to their career, work contract (permanent or temporary), position, work scheme, level and class, time of experience, endowment in positions of trust, incorporated bonuses, titles. Therefore, there are more factors that hinder the creation of a common identity for education professionals (Oliveira, 2002).

The present social scenario, besides other factors, has contributed to the intensification of the demands on this profession and schools, and, consequently, on the "identity crisis". Social and economic changes in our society directly affect the expectations about teachers' work, in other words, teachers' professionalism. For Tardif, Lessard & Gauthier (2001),

> motion for professionalization of teaching and the training advances it demands are what is now called "social constructions", referring to the symbolic and organizational activities of groups trying by various means to enforce their conceptions of profession and training (p. 16).

In this respect, the author draws attention to the fact that teachers have been increasingly under the condition of spectators of their professionalization process, with little room for autonomy, since the definitions about teacher training and profession are formulated by actors external to the process - higher education researchers and education policy-makers. Therefore, professionalization process takes place through social construction, ie, "it is a dynamic and contingent reality, based on collective actions of a group whose identity is constructed through interactions with other groups, instances and social actors"

Based on this definition, it is possible to measure the complexity involving the teaching practice and the formulation of teachers' professional identity, since multiple determinations are involved in this process. These professionals have been influenced by schools, reforms and the political scenario that comprises personal commitment, desire to learn how to teach beliefs and values, and to learn the subject they teach and teaching methodologies (Lasky, 2005 as cited in Carlos Marcelo, 2009).

In such context, we intend to analyze the social representations of active teachers about being a teacher, trying to understand the influence of initial training and work experience on the construction of these representations. In this sense, we formulated some questions to guide this study: what social representations do active teachers have about their profession? How do these representations help understanding the creation of professional identities?

Therefore, when we try to understand the creation of this professional identity, it is necessary to recognize the social representations of active teachers, based on the principle that this representation allows teachers to define the components of their professionalism, as well as certain actions and behaviors.

Contreras (2002) helps us to understand this, defining professionalism as related to the qualities of the professional practice of teachers, according to the demands of educational work. More than that, for this author, it is important to analyze the representations about professionalism, since the imagery that teachers have about this subject associates the professional concept to the occupational values that comply with characteristics and needs of the completion of teaching practice.

Thus, in this research work, we will deal with three dimensions that characterize professionalism, which are important to understand the problem of autonomy from an educational perspective, as Contreras (2002) points out. The dimensions are: moral dimension, commitment to community and technical dimension.

For the moral dimension, teaching is a moral commitment for teaching professionals (Contreras, 1990 as cited in Contreras, 2002). It is related to the moral obligation present in education, which is above any contractual obligation that may be established in the definition of a job (Sockett, 1989 as cited in Contreras, 2002). The implicit characteristics of this dimension are related to the fact that

above academic achievement, teachers are committed to all their students and their personal development, in spite of the frequent tensions and dilemmas: it is necessary to foster advance in the learning process of their students, without neglecting the needs and recognition that all students deserve, as human beings (Contreras, 2002, p. 76).

This dimension seems to be very connected to the emotional relation present in teaching practice, as well as to the commitment to professional ethics. The feeling itself of being committed or morally "obliged" demonstrates the emotional aspect of this profession.

However, institutions, administrative regulations or the characteristics of teachers' work contradict or even hinder the accomplishment of their values, which leads to tensions and dilemmas that can only be interpreted as moral dilemmas. Therefore, it is possible to notice that teachers are professionally committed to modify their working conditions, overcoming contradictions and conflicts, or finding out arguments or reasons to explain their condition.

As for the commitment to the social community where teachers develop their professional practice, it is important to highlight that the moral dimension intrinsic to the educational process is not an isolated fact. On the contrary, it is a social phenomenon. So, education is not mainly a personal problem of teachers, but an occupation socially demanded and publicly assigned (Contreras, 2002).

However, it is also necessary to consider the involvement of communities in the decisions related to teaching, although it is troublesome, since,

> on the other hand, teachers can only assume their moral commitment based on autonomy instead of obedience, since conflicts and dilemmas can only be solved based on their autonomy [...] This double awareness that they must necessarily be autonomous in their professional responsibilities and, at the same time, publicly responsible, is a source of contradictions and tensions between teachers and communities, which is commonly presented as a conflict between the authority of professionals and of society (Zeichner, 1991 as cited in Contreras, 2002, p. 79-80).

Thus, these problems are related to the forms of public participation in education, through which society influences the decisions about the content of teaching and controls teachers' duty.

School commitment is mainly supported by the transmission of contents and knowledge to students. However, based on the concept that schools are also in charge of providing social opportunities through education, it is possible to notice that, in many situations, teachers face conflicts with school institutional definitions and regulations about its functions and the traditional practice. Therefore, the recognition of school social meaning and education intervention policy sometimes is transformed into oppositional practice and strategic actions that broaden the meaning of teaching professional practice. Nowadays, teachers are not seen as isolated people in a classroom. Instead, there is a collective and organized intervention in places that dissociate knowledge from the social and political consequences of teaching professional practice (Contreras, 2002).

The technical dimension, according to this author, is based on the perception that it is evident that teaching practice requires, as any other activity, some mastery of skills and techniques, acquisition of contents and, in general, didactic resources. Besides, it is necessary knowledge about cultural aspects and the context or the object of the teaching content. It is vital to know that professional competence exceeds merely technical procedures of teaching resources (Contreras, 2002).

The moral obligation, here proposed by the moral dimension and the commitment to a community demand professional competence – here related to the technical dimension – consistent with both. As for the competences proposed through this dimension, Contreras (2002) affirms that it is only possible to judge and take professional decisions through professional knowledge, since it provides reflections, ideas and experience to support such decisions. However,

> Professional competence refers not only to the knowledge capital available, but also to the intellectual resources available aiming to extend and develop this professional knowledge, its flexibility and depth. The analysis and reflection about professional practice is valuable and a basic element for teacher professionalism (Contreras, 2002, pp. 83-84).

Through these three aspects of teacher professionalism, it is possible to achieve different forms of understanding teaching professional autonomy, according, evidently, to the educational context, its purpose and practice. Finally, it necessary to understand what teachers think about "being a teacher" in a way that

they feel they are the object of their own actions. Teachers are the main actors of education action, and that is why it is important to hear them to establish their strategic actions aiming to value their work and improve the quality of teacher training courses.

METHOD

We decided to prioritize the qualitative approach in this research, since it reveals the dynamics and singularities that allow the identification of the social representations of the group of teachers related to being a teacher (Ludke & André, 1986).

Subjects of the research

We defined as subjects of our research work teachers who had graduated in Pedagogy, up to six years ago, from the Universidade Federal de Viçosa (UFV) and were employed as elementary school teachers, dealing with the first series (qualifications available for graduates in Pedagogy).

These teachers should be in the first years of their career. Huberman (1989) and Lima (2005) believe that adaptation to the profession occurs in the first 3 to 6 years of professional practice. Therefore, our intention was to analyze the representation of these subjects related to teaching when they are still adapting to their new activity.

The main subjects of this research are 15 teachers of public and private schools of municipalities of the Zona da Mata Mineira, ranging between 25 and 29 years of age.

Instruments for data collection

Questionnaires and semi structured interviews were used as instruments of data collection. The main objective of using the questionnaire was to define the social, economic and cultural profile of the participants, knowing their life style, cultural practices and social and economic context, recognizing that these elements are the basis for such practices and meanings.

The semi-structured interview was used aiming to deepen the approach to our object. The interview contained questions that sought to make the subjects relaxed to express their ideas, while the researchers should make them keep the focus of the interview, in case they digressed from the subject. The interview also allowed access to information about their motivation to enter and remain in the profession, their life and working conditions, professional perspectives and the meanings they ascribed to their profession. Due to lack of space, the present work is limited to the analysis of the interviews.

Data analysis

The data achieved through the interviews were analyzed with close attention to the nuclei of the meanings or themes that could be extracted from the discourses, which were directly related to our object of study: the representations of being a teacher.

The interviews were carried out at the schools where some of the teachers work and in the house of some others. They were recorded and then transcribed for analysis. All the interviews were carried out and transcribed by the researchers, so that the participants could not be identified and the situations of the interview could be better controlled.

The analysis of the interviews, as previously mentioned, was performed according to the content analysis technique proposed by Bardin (1995). At first, an initial data analysis was carried out, considering the responses to each question. The responses were organized in tables to facilitate the organization of the units of analysis. Next, for a better understanding, a larger number of responses to different questions were grouped. "Categorization is an operation that classifies elements that form a set, by differentiation followed by re-grouping based on analogies and defined criteria" (Franco, 2005).

Thus, more agglutination of the responses of the interviewed people could allow better understanding and, consequently, a categorization more appropriate to the objectives of the research. Therefore, the path to reach the teachers' social representations allowed broader understanding of the teacher identity construction process.

RESULTS AND DISCUSSION

After conducting the questioning regarded relevant to find out the social representations of the teachers interviewed, we finally asked them what was the meaning of **being a teacher**, mainly seeking to know the identity they attribute to themselves as teachers. For the analysis of the responses given, their representations were grouped into two dimensions: moral and technical.

The moral dimension was perceived in the discourse of most teachers, namely, 73,52% (n=50) of the concepts of being a teacher were related to the moral dimension. These representations provided by the teachers reveal a commitment to education targeted at promoting changes; dedication is more important than any contractual clause; respect for students and their parents; awareness of their role in society (Contreras, 2002). In short, the teachers see themselves as committed and serious professionals, eager to develop this teaching relation, as revealed in these reports:

> Being a teacher is a constant challenge, a daily study, dedication and an enormous pleasure. It means to believe in people and try to give them a better future. It means that you like people: you like education and believe in it, if you don believe in education, do not become a teacher **(Paula: early grades of Elementary school; public school; permanent teacher; 4 years of teaching experience).**
> First of all, you have to like it a lot! You must love this profession! And you must have patience, love for the profession, for the people and be focused on a target **(Alice: Early Childhood Education; public school; permanent teacher; 2 years of teaching experience).**

Contreras (2002) considers that the moral dimension of teaching is closely linked to the emotional issue present in every teaching relation. Besides, we also observed affective aspects in the discourses of the teachers - 11 utterances –, mainly when they relate teachers to family relationship, which is observed in the reports of the teachers Fátima and Marcela:

> Being a teacher is almost like being the father or the mother of a child, since you have to bring children up, telling them what is wrong and what is right **(Fátima: Early Childhood Education; private school; temporary contract; 2 years of teaching experience).**
> Being a teacher... is being an educator, father, mother, friend, partner, because students are in need, they lack something, I think schools should not focus only on content, but schools should teach for life, ethical values, citizenship, so, being a teacher is this **(Marcela: early grades of Elementary School; public school; temporary contract; 3 years of teaching experience).**

It must be highlighted that teachers value education. For them, it is vital to believe in education and be aware of their role in schools to carry out a good job. This element appears six times in the discourses of the teachers. Teresa makes it clear in the beginning of her speech about being a teacher:

> For me, being a teacher is, above all, believing in education! I think teachers must believe, they must know that, in spite of everything, all the system in which we are inserted, our work can surely make a difference! **[...] (Teresa: early grades of Elementary School; private school; CLT contract; 6 years of teaching experience).**

Commitment to the profession, love and dedication are representations frequently observed in the discourse of the teachers. To be gifted and enjoy being teachers also seem to be essential for some of them. These elements are mentioned by the teachers 11 times in their utterances. For them, knowing the contents is not enough, it is necessary to be gifted to exercise the profession. The valuing of the profession seems to come from within schools, so that society can value it. Most of those who highlight these representations in their speech believe that without such precepts, it is almost impossible to remain in the profession:

> Being a teacher is first of all loving what you do,[...] being aware of one's role is very important, isn't it, and to have it all, to manage to make it all, you should have many qualities, that was what I said, you have to be dynamic, creative, persistent, patient, you should have many qualities that are not easy to achieve, you know, but above all, you have to like it very much, love what you do, I think that being a teacher would really be an act of love, because if you think about the difficulties, you don't stand, it would be very beautiful **(Nanda: early series of the Elementary School; private school; CLT contract; 6 years of teaching practice).**
> Being a teacher is enjoying the things you do, be loving, attentive, perceptive, because you have to realize the need of each student, knowing by just looking, how they are, if there is anything wrong; you must be friendly, a real partner of your students, transmitting confidence to them; it is a set of feelings, a mixture that you know little by little, and it is all that, you should be lovely, understanding, it demands a great effort, goodwill and only with this set of feelings you succeed,

because on the contrary, it won't work! **(Lara: early series of Elementary school; private school; CLT contract; 2 years of teaching practice).**

In relation to the technical dimension, which achieved lower frequency in the discourses of the teachers interviewed – 26,47% (n=18), we observed that this dimension allows the acquisition of professional competence, namely, this is a dimension that characterizes teachers by what they do, by their competences. Seeking professional autonomy and reflecting about their practice are very important aspects in the search for teacher professionalism. However, it was possible to observe that even appearing during the whole discourse, only one teacher pointed out these aspects as representations of being a teacher:

> It is someone that must understand several situations, different moments, being really patient, searching for the best for each student. It is difficult... And there is the point that you are always seeking the best for students, teaching in a way to make them learn with pleasure, always reflecting about different situations **(Júlia: early series of Elementary School; private school; CLT contract; 6 years of teaching experience).**

Therefore, it is necessary to point out that teachers may develop their professional competence, understood as an intellectual competence that is not only technical, when they start to recognize their capacity for a reflexive action in the construction of professional knowledge related to the content of their profession, as well as the contexts that condition their practice and extrapolate classes (Giroux, 1990; Smyth, 1987 as cited in Contreras, 1999).

CONCLUSIONS

At the end of this work, it was possible to observe that the social representation of being a teacher constructed by this group of teachers holds moral, vocational, emotional and technical characteristics, among others, related to teaching. Such representations were disclosed through questionings about characteristics inherent to teachers, namely, the experiences lived while taking their Pedagogy undergraduate program and their professional experience in classroom.

The social representations of teachers about teaching seem to be related to the moral dimension. In other words, a dimension that characterizes teachers' professionalism, demonstrating that teachers conceive themselves and their profession affectively, emotionally, vocationally. Therefore, based on the discourses of the teachers interviewed, and the literature studied, it is possible to agree with Nóvoa (1999), when he affirms that even when "the mission of educating is replaced by the practice of a job, and vocation gives place to profession, the original motivations do not disappear, in other words, the prevailing feelings of teachers are those elaborated from a set of norms and values widely influenced by beliefs and moral and religious attitudes" (p. 16).

In general, it was possible to perceive that the choice of becoming a teacher is mainly influenced by families, making it very cleat that professional representation is related to vocation for teaching. "Love for children" and the interest in the profession since childhood also indicate this emotional and affective representation of teaching, which seems to agree with the vocational dimension prevailing over the years, in spite of the social, cultural and institutional changes we observe in our society.

We also observed the prevalence of a positive representation of the teachers in relation to their profession. Perceiving that the social representations of the subjects establish communication and social behaviors, we consider that these positive representations of professional teaching may counterbalance the negative and demanding representations of this profession nowadays, since, according to Gilly (2001, p. 321-341), social representations assure the possibility of preserving the balance of the subjects themselves, as well as their need for coherence in their social practice and in their relations with those that surround them.

Abstract: Objective: To study the implications of reflective diaries as a tool for reflection and evaluation of a proposal for collaborative consultation. **Methodology:** A total experience of two teachers of a public school in a town in the state of Sao Paulo. Data were collected through teachers' reflective field notes and analyzed the social interactionist perspective from the theoretical assumptions of Bakhtin / Vygotsky and Volochinov. **Results:** The findings revealed that teachers had a personal interpretation of the element worked in research, professional practice, with comments that expressed their ways of understanding the component concerned, consulting collaborative. **Conclusion**: We could confirm the reports through the teachers field notes that the proposed Collaborative Consulting helped the teacher to exchange experiences and reflect on their own practice.

Keywords: collaborative consultation, teachers, group practice

INTRODUCTION

Thinking about the possibility of producing a critical reflection together with professionals in the education team, seek and put on the agenda collaboratively through a process of research-training, emphasizes the importance of collaborative work. Research on collaboration has served as the basis for creating knowledge to build/implement new/other educational alternatives which may be facilitated school inclusion processes, considering the complex interactions in context (Aldinger, Wagner & Eavy, p. 1991).

Thus, investigating the transformation of the practice of teaching professionals, from research and critical reflection of pedagogical action, through continued context training is a healthy process to meet the diversity of inclusive contexts inclusive in the 21st century.

In this perspective, the crucial element of this text is the current issues involving the theme of school inclusion: the challenge to qualify the pedagogical work developed in classrooms, as well as providing regular assistance for teachers to reflect their practices.

THEORETICAL REFERENCE

In this direction, several studies (Mendes, 2008a; Daniels, Creese & Norwich, 2000; Duchardt *et al.,* 1999) have emphasized the role of collaboration as a natural component in special education aid, that is emphasized the school consultation, named collaborative consultation, an effective technique for various purposes, defined more precisely as an interactive process that enables people with various skills to generate creative solutions to mutually determine the problems of the school environment, where the biggest consequence of collaborative consultation is to provide comprehensive and effective programmers for students with special needs in regular classrooms.

The literature has been pointing out that the collaboration between special education teachers has made possible a reflection of pedagogical practice and extending the possibilities of better serve students with special educational needs in common class, in addition to provid a professional development focused on own school (Capellini, 2008).

The educational partnership between the regular and Special Education is known as collaboration and can be provided in the form of two models: a) the collaborative consultation - in which the teacher/special education professional promotes assistance to regular education teachers and indirect services for students; and (b) co-teaching, in which educators experts work with regular education educators, providing direct services in the common room (Weiss & Lloyd, 2003). Collaborative consultation is, therefore, a support model-based collaborative work between professionals (psychologists, physiotherapists, Audiologists, etc.) and common school educators (Blackwell, 2006).

The peculiarity of collaborative consultation is working together, where both the consultant (Professional) and consultee (regular teacher) share knowledge with a view to develop a solution in the school context. Maybe features like collaborative consulting are absolutely understood only with a future change in philosophy having in mind the learning difficulties and behavior, where there are other paradigms and inclusion can be favored with resources and support that are definitely part of regular education. But until that happens, you can not continue discouraging children and young people of their rights to education, healthy development, equal opportunity and social harmony.

The consultant's role is to assist the teacher to build strategies and review the potential of their students so that they can effectively develop academically. Collaboration is a template to determine a plan and it is thought, and supported by all who are involved in the process (Mendes, 2008b).

Generally the collaborative work involves a pair of teachers (regular and special education) where his arrangements can occur during fixed periods of time and their strategies will depend on the curricular demands, student needs and characteristics (Bauwens, Hourcade & Friend, 1989).

The collaborative consultation is a proposal in which collaborative learning is present, because the professionals involved reflect together to solve the problems of the classroom.

Both consultant and consulted should have contributions to make and to improve the situation of the student. Kampwirth (2003) describes that the collaborative model should avoid the dependency relationship between consulting and consultant that can easily be developed. The author also proposes a list of characteristics for the collaborative model that comprises since coordinate conditions, the involvement of the consulted throughout the process and with the right to accept or refuse a strategy because the advice is voluntary.

Collaboration and cooperation are fundamental to the implementation and monitoring process. The student is the key of the plan and determines future modifications. In implementing it the student, the class, the teacher, parents, the consultant, anyway all the persons involved must have an understanding of their role. The consultant is also important to know about the skill levels of those people, so that the plan is well implemented and succeed. The consultant and consulting team must work together and ensure issues to direct targets. Attempts to eliminate the resistance are fundamental and should establish a collaborative relationship.

According to Kampwirth (2003) the collaborative consultation should be developed in steps, which are:

1- *referrals* i.e. should be conducted with the teacher who needs help with his students and that a consultant should explore information form (to take an interest in the context of the case); 2-) *initial discussion with the teacher*; 3-) class *observation*, since in order to solve the learning and behavior problems it requires a longer observation of the aspects relating to verify whether the dynamic behavior and teaching and learning process. The consultant must have common sense to reflect and then to observe and collect important data: 4-) *meeting with parents*, that dynamic stresses that parents must be called before starting the consultancy, but the consultant should be very aware of the dynamics of the problem; 5-) *assessment and referral of students*; 6-) *Plan of intervention*, at this point, the consultant shall review all other referrals: talking with the teacher and parents; the observation of the child and of the class, the possibilities for discussion among those involved in the process. Equipped with the plane and having done all the reflections it is recommended that the collaborative approach is carried along with the consultee in order to develop a plan for intervention; 7-) *monitor the intervention*, because the evaluation should be formative and cumulative, i.e. based on the process to determine the goals of the consultancy.

In this way the result of Alpino's research (2008) corroborates the collaborative consultation program of professional / physical therapist for teachers with students with cerebral palsy seen in the context regular school. From the perspective of school inclusion this work had the purpose to verify if the collaborative consultation promoted by a physical therapist for teacher could improve children with severe or moderate devellopment who attended elementary school in common classes**.** The findings were significant from the involved team perspective, concluding that the physical therapist has contributed to the process of school inclusion of these students through collaborative consultation.

Thus, for Gregory (2010) collaboration has proved the main contemporary strategy to feed innovation, to create and sustain effective educational programs. When considering the difficulty of the educator in knowing effectively the needs of all his/her students, the author suggests that the knowledge and skills of specialized teachers and professionals in instructional strategies, approaches, cooperative learning, behavioral problems and evaluation practices among others knowledge, could provide the most effective schools.

Under this perspective, the increasing number of children who need specialist care boosted the demand for services where the playing field became the school. In addition, the professional specialist acting in the school would be recognizing the importance of teacher support to solve the school problems.

Under this perspective, the increasing of children who need special care boosted demand for services where the playing field has changed to the school. In addition, the professional expert acting at school would be recognizing the importance of teacher's support in solving problems of school (Mendes, 2008b).

Thus, the collaborative consultation seems to contribute to the minimization of special educational needs-NEE by many regular public school students, due to poor academic performance and problems of development, these students are prevented from developing in the learning of new content and thus become marginalized within their own school environment.

Accentuated learning difficulties have been of great interest for Special Education because of problems in this area can affect social inclusion and thereby produce a negative impact on the student's self-concept and in their sense of self-efficacy learning causing a great negative impact leading to difficulties in academic learning (Stevanato, Loureiro, Linhares & Marturano, 2003; Anache, 2008).

In this perspective, Romero (1995) and Smith and Strick (2001) and Jesus (2008) highlighted the role of the teacher as a fundamental item to identify and screen the difficulties presented in school. In fact, the teacher's experience, as shown by these authors, is fundamental in learning situations in the classroom, observation of behavior, observation strategies for problem solving, observation of the student regarding their attitudes towards questions and observation in relation to the performance in the assessment and school development. In this light the family is also seen as essential to facilitating this process.

According to Pimenta (1999) continued education for teachers of elementary education needs new approaches and renewal of scientific thought and institutional practices concerning the training of teachers, because according to Perez Gomez (1992) teacher training adopted in many Institutions, understood only as a socialization process and induction training in classroom practice, without resort to support conceptual and theoretical research, leads to the reproduction of vices, prejudices and myths accumulated during the teaching practice (Anache, 2008).

Gregory (2010) emphasizes some basic features that should be considered in collaborative consultation: the relationship between the involved called, consultant and consultee, can not be hierarchical, the relationship should be equal among peers.

In Brazil, Mendes (2008b) collaborative work in schools has been investigated as development strategies and not as a process of training teachers in diversity.

Thus, the teacher's reflection on their own practice becomes a significant contribution to the development of teaching and learning. Reflective diary or journal classroom as an instrument of research teaching in the context of a teaching training work is contributory (Ohuschi & Menegassi, 2009).

According to Zabalza (2004), the introduction of reflective didactic proposals into action, allows the teacher to get rid of certainties and behavioral routines and acquire skills that will enable you to adapt to the knowledge arising from research and develop its own investigations in the classroom. In other words, the reflexive problems of research practice allows teachers to make their beliefs and theories implicit, develop them and/or will restructure them, establish chances of intervention with the aim of resolving these problems from new perspectives of understanding.

The daily classroom still according to Zabalza (2004) is as a strategy, being greatly valued in the training of teachers because the reflective writing activity, allowing the teacher a deeper note of events practice.

According to Bakhtin/Volochinov (1992), the "monologização" process of social consciousness occurs for the individual, because according to them, "externalizing it themselves, the inner content changes appearance as it is obliged to take ownership of the material, which has its own rules strange to the inner thought"(p.111). This way, the authors claim it is the expression, namely, the externalization of a speech, which organizes the mental activity of the individual and not the opposite, because it is the social set in which the announcer shares that determines the form of expression.

Vygotsky (1988) comes to Bakhtin, when the calls of "internalizing the internal reconstruction of a foreign operation" (p.63), saying, therefore, that consciousness is internalized through interactions that are outside of the individual: the social to the individual.

However, to amplify this knowledge, seized the social need, according to Vygotsky (1988), a time to mature, because "The transformation of an interpersonal process in an intrapersonal process is the result of a long series of events throughout the development" (p. 64).

In the interacionista approach, we also have the reading and discussion as prior activities, however, they do not occur so directed, but through the interaction between individuals, creating dialogues, producing directions, from several voices found there. The written production happens in another time, which provides a distance, i.e., a timeline needed to be internalized, which gives a more sophisticated, since there was no time to mature and that the words of others became the producer's own words therefore according to Bakhtin

(1997), "the words of others introduce their own expressiveness, his tone value, assimilators, redesigned, changed" according to Bakhtin (2003, p. 294).

That way, writing occurs "as a process, a do and redo the text and an ongoing remake of producer, elaborating his knowledge of the world, language and yourself" (Pazini, 1998), i.e. the timeline required to occur the internalization and consequently the ripening.

According to Smith (1992) four actions are necessary for the teacher to engage in critical thinking: describe, inform, confront and reconstruct. From this perspective, gender reflective diary was proposed.

Under this perspective the aim of this study was to verify the implications of reflective diaries as a tool of reflection on his practice and evaluation of a proposed collaborative consultation.

METHODOLOGY

The study was based on collaborative research modality, whereby the browser takes ideas to the field of research to cause any impact on the environment and participants on which the data were collected. This study is part of a pilot study of amplitude more accomplished as a requirement for completion of the course ' Topics in special education: collaborative consultation "inserted in the curriculum of the graduate program in special education from the Federal University of São Carlos-UFSCar.

The analyses were conducted in sociointeractionist perspective from theoretical assumptions of Bakhtin and Vygotsky/Volochinov. This way, we reflect on an aspect of verbal interaction proposed by Bakhtin/Volochinov, the process of "monologização" (or internalization in the vision of Vygotsky (1988)), which is fundamental to the formation of metaconsciousness, to then present the analysis of records harvested in reflective journals

Participants and location: Study participants were two teachers from a public school network belonging to a small town located within the State of São Paulo. Both of them were female, with 54 and 55 years old, both graduated in pedagogy. The teachers included in this study were those that agreed to voluntarily participate in the survey, whose students (indicated by them) had learning difficulty and behavior. The names of the teachers were modified in order to preserve anonymity.

Procedure for data collection: the data were collected through teachers' reflective diaries, which states that individual or collective writing and reading is a daily activity and self-construction of autonomy. The teacher diary is regarded as an instrument to detect problems and clarify concepts. The study was previously drawn up in two steps. At first the researchers contacted the teachers explaining the content of the proposal of collaborative work, which was accepted without obstacles and with much enthusiasm by the same. Also in this stage produced a script to punctuate and help in the comments of the meetings. In the second stage began meetings and collaborative consultation itself, where planning and guidelines were giving in the form of dialogues and readings followed by discussions on chosen themes. To make this meeting extra classes were given.

Data analysis procedure: Teachers reflective diaries were described chronologically, the trajectory of lessons involving the practice chosen, it is also the teachers presented a personal interpretation of element worked in research. Thais is, enriched description with comments expressing his way of understanding the element in question, the practice of inclusive and collaborative consultation.

RESULTS

In the first moment of interaction between researchers and teachers/participants was contributed to scientific knowledge about inclusive practices, seeking to understand the process of acquisition, studying and discussing their different conceptions and characterizations. This gave scope for the development of possible intervention strategies practice with students. The reflections undertaken during plans were always held on the experience of everyday practice and theoretical reference used by teachers.

Then a second time sought to deepen the analysis of the material studied – reflective diaries. It was from this step that the teachers were completely immersed in education. They highlighted that during the process, the biggest transformation in his practice had been the construction of reflective diary, because when a person recites the facts lived by herself, which reconstructs the path traveled by giving them new meanings. Thus, the reflection before the practice causes changes in how people understand themselves and others (Zabalza, 2004). The establishment of a friendly interface also contributed to the collaborative process.

As expressed in the following reports:

" L. and A.P. tried and showed willingness to perform the activity, but it was only possible with my help "

"... our meetings gave us the opportunity to emerging ideas with attempted changes with the evolution and progress in relation to our students and our pedagogical practices."
(Daily reflective Teacher Sylvia)
"B. is already starting to read and write so that they understand, l. already presents more difficulties, both in reading ..."
"Today I found very productive activity because awakened interest in students ... they spoke spontaneously on the subject."I felt that they, especially the b. achieved activity, saw that he felt very happy." (Teacher Aracy reflective diary)

Work in collaboration provided to teachers a more critical look to their practice, and enabled further on practices developed in collaborative consulting program, not detailed in this report. The work of researchers in this process has proved sometimes difficult, but allowed him to look to professional reality with greater security and autonomy.

However, the collaborative model in this work is not only an implicit knowledge in practical activity. It is a dialogue between the lived practice and theoretical constructions made reflexive by both partners – researchers and teachers. This action showed the positive impact of collaborative consultation when worked effectively and committed.

Thus, the teachers had the chance to think about their lessons, i.e.to become the other of themselves, as postulated Garcez (1988), which may reflect on his writing, his practice and develop metaconsciousness - the strategy to take conscience about his writing process, and therefore as subject.

It was possible to score an assessment and practical nature of the collaborative consultation from the viewpoint of the participants-teachers, for work beyond that permit the reflection of pedagogical practices by teachers / participants, it becomes important to consider the implementation of collaborative strategies in future research, which may, in turn, perhaps subsidize Public Policy.

CONCLUSION

We believe that the teachers thought that, in writing as design work, there is a continuous process of teaching-learning process, because they tried to relate his writings and activities designed for students, and also understood that, in this process, in accordance with Sercundes (1997) the production of a text serves as a starting point for other productions. Furthermore, it was worked just as well in time for the sedimentation and the internalization of knowledge (Vygotsky, 1988), i.e. there was no time for reflection and for their own words to become words interjections according to Bakhtin (1997).

According to Demo (1992, p. 25) in education is mister working educational spaces of "learning to learn" have attitudes research on practical reality, what was possible to these teachers as they reported their practice in an attempt to approach reflections that would lead to new proposals for performances.

Generally observed that through analysis of reflective journals could emphasize that the collaborative consultation led to these teachers the opportunity to review their practices and try new ways to meet the diversity of the student with special needs. The rest of the exchange of experience between the pair led to an increase of activity of the teachers, demonstrating greater autonomy in the process of creation and operationalization of activities which promoted sustainability reflective practice.

So as it was punctuated by Mendes (2008a) exchanges of experience between employees and teachers encourage the resolution of problems, because the reflective dairies provide ways to act and this leads to an action-reflection of the daily practice of the educational context. Moreover check the reflective diaries allow you to understand the demarcated by the actions of intervention teachers which generates specific actions for new forms of interaction with the student.

Finally, it is worth noting that, a priori, this study can be considered a small experience, but with fundamentals that incite to future reflections and new proposals for studies, based on action-reflection of professor culminating in the development of reflective journals for a joint action within the school inclusive.

cellis1@ashland.edu

Abstract: Colleges in the United States of America have been charged with preparing future teachers to meet the needs of diversity in their classrooms. This paper focused on the perceptions of student teachers and pre-service teachers who did their student teaching requirement abroad and how these teachers approached diversity in their classrooms, how diversity manifests in their instruction having been through this perception altering experience. The stories of transformation are framed through the lens of their experience abroad and how those experiences acted as catalysts in the classroom to work from a curriculum of diversity.

Keywords: diversity, teaching, abroad, culture

BACKGROUND TO THE STUDY

The National Council for the Accreditation of Teacher Education (NCATE) stated in their 2008 guide to the professional standards for the Accreditation of Teacher Preparation Institutions that teacher preparation programs are to include a component in which students become proficient in working with diverse students in P–12 schools. The rationale being that teacher education programs produce educators who "can reflect multicultural and global perspectives that draw on the histories, experiences, and representations of students and families from diverse populations" (p. 36). The fact is that "we live in a global age, and our schools and teachers must prepare today's students to take their places as global citizens. Such education requires an awareness of the world, its people, and its conditions" (Mahon, 2010, p. 7).

The goal of having educators prepared to deal with diversity in the classroom is a clear response to the fact that (a) immigration and diversity continue to be important variables to be met in the American education system and (b) "technological advances in communication and information processing, along with lower trade and investment barriers. . . translate into further competition" (Tajes, & Ortiz, 2010, p. 19); thus, American 21st century learners will have to compete in a global economy where they deal with people of other cultures on a frequent basis. Riche (2000) noted that "The U.S. population is significantly more diverse racially and ethnically now than it was in 1900" (p. 4). According to the 2000 United States census, 11.1% of individuals residing in the U.S.A. were foreign-born persons. Further, that same year 17.9% of families spoke languages other than English at home (U.S. Census Bureau, 2008). "We live in a mobile world where families move across national/cultural boundaries and enroll their children in schools expecting an education – wherever it is offered – that prepares them for their future" (Kissock & Richardson, 2010, p. 98). Thus, "we live in a globally interdependent world, are part of the global (not local) professions of teaching and teacher education and are preparing educators to educate young people who will live past the year 2100" (Kissock & Richardson, 2010, p. 91).

To enhance competency in a global economy, countries around the world are currently undergoing educational reforms "in order to prepare their students to be successful in the knowledge-intensive, high-tech, and globalized economy" (Smink, 2007, p.36). Unfortunately, in the United States, teacher preparation programs have been slow to react to the need for cultural competency in schools. In fact, some have accused them of failing to "act on the need to prepare our graduates for the globally interdependent world in which they will work and their students will live" (Kissock & Richardson, 2010, p. 89). Traditionally, "cross-cultural experiences for preservice teachers vary widely, from university-based experiences to full semesters or even years spent abroad" (Willard-Holt, 2001, p. 506) and "university-based cross-cultural experiences include coursework in multicultural and/or global studies, in-class simulations, conversation partnerships with international students, study tours, and semesters or years abroad" (p. 506). Few students are noted to participate in these programs though. For instance, in 1994, the American Association of Colleges for

Teacher Education estimated that only about five percent of American K-12 teachers had any academic preparation in global or international studies (Merryfield, 1994). By the 2009/2010 academic year, 260,327 American "students studied abroad for academic credit. . . . Student participation in study abroad has more than doubled over the past decade" (Institute of International Education, 2010). This number is still relatively low in proportion to the current enrollment rate of college students in the USA; in 2007, approximately 18.2 million students were enrolled in degree awarding institutions (International Center for Educational Statistics, n.d.).

To meet this criteria of teaching diverse populations, generally speaking, colleges of education have sought to "apply what we know about culture learning in teacher education programs to better prepare new teachers to encounter this increasing global diversity" (Cushner & Mahon, 2002, p. 45) which, in itself, intentionally is sound, but speaking about diversity and dealing with the rich and varying experiences that diversity brings to the classroom are two very different things. Perhaps more sound logic would be to work from the following premise:

> Developing the skills that enable an individual to live and work effectively among individuals from cultures other than their own requires significant, long-term, direct personal interaction with people and contexts different from those in which one is most familiar. (Cushner & Mahon, 2002, p. 45).

As Cushner and Mahon (2002) observe, "International student teaching provides an ideal way to address this" (p. 45).

Cushner and Mahon (2002) performed a study in which they looked at data from students who participated in the Consortium for Overseas Student Teaching (COST) program. In 2002 members of this program had the opportunity of placing student teachers in international venues "in the countries of Australia, the Bahamas, Canada, England, Ireland, New Zealand, Scotland, and South Africa" amongst others (p. 46). Results of Cushner and Mahon's (2002) study suggested:

> That the greatest impact was on students' beliefs about self and others, as evidenced through increased cultural awareness, improved self-efficacy and self-awareness, and professional development in terms of global-mindedness. These categories interact to demonstrate a new understanding of one's own role and improved ability to interact and teach in diverse cultural settings" (p. 49).

More precisely, "as a result of an impactful international experience, individuals begin to question their stereotypes of others and aspects of their own culture, which had before gone unexamined" (p. 49) and extended international teaching placements were seen to increase their cultural sensitivity which involved them in the process of learning about other cultures including their own. As Cushner and Mahon (2002) observed, "once out of the United States, students are able to 'turn around' and in effect look back on the country they left, viewing it from a different place and point of view" (p. 53).

Research on brief cultural immersion experiences of pre-service teachers has demonstrated significant lasting changes in attitudes and behaviors. Willard-Holt (2001) described the effects of a six day long cultural immersion in Mexico with the following outcomes experienced by pre-service teachers:

a) Confrontation and removal of preconceptions.
b) The first-hand experience of being in the minority.
c) Became less likely to prejudge students based on cultural background, linguistic difference, or disability.
d) Increased patience and empathy.
e) Commitment to expend more efforts in finding other ways to convey concepts to children who seem not to understand.
f) Became more globally aware and to instill this attitude of the importance of global awareness in their own students.

It appears that immersion functions well as a model when compared with classroom strategies to instill diversity awareness. As Dee and Henkin (2002) observed, classroom based teacher education interventions "designed to help individuals acquire the appropriate understandings and skills needed to work effectively with diverse student populations may not have significant impact unless teachers are willing to explore beyond the familiar comfort zone of the cultural status quo" (p. 36). Further, immersion experiences have strength over classroom instruction on diversity in that they force individuals to "confront and deal with the

ambiguities and psychological risks associated with learning about their own culture and those of others" (p. 36). The central issue remains, as the Wisconsin Center for Education Research (2004) points out, that without direct experiences in diversity new teachers "face large numbers of students who are poor, who come from varied racial and ethnic families, and who speak a first language other than English" (p. 4) without the tools or perspectives which may culminate in a "lack of commitment to principles of human diversity, equity, [and] social justice" (p. 7).

CASES AND REFLECTIONS

To see how theory falls into practice we spoke with college students who were in the preparatory stages for a semester of studying abroad and we surveyed teachers who did their student teaching experiences outside of the United States of America. In order to provide information rich cases we selected supporting anecdotal data from the narratives of student teachers' public blogs while abroad. Experiences were analyzed under the lenses of the current literature of study abroad experiences and diversity to see how those experiences impacted cultural competency and teaching methods.

There appears to be a trend in narrative data that we analyzed regarding the movement toward cultural competency as a teacher. We first asked six education students from the USA and Brazil to describe their motivation in studying abroad in each other's countries. Overwhelmingly, students suggested that they wanted to learn about the other's culture. One American student observed:

> The main reason I chose to participate in this [exchange program]. . . is that by going to Brazil I will expand my cultural horizons. Not everyone in the world is the same, and as an Intervention Specialist I will see this everyday in my classroom. By going to Brazil I hope to eliminate any stigmas of people who are different in my classroom and also in other people's lives. I feel that in America we are far too judgmental and not very accepting, and I hope that by going to Brazil I can work to change that. (A. Carle, personal communication, March, 23, 2011)

This illustrates Cushner and Mahon's (2002) idea of students being able to analyze and look back on their previous conceptions of the American reality and view it from a "different place and point of view" (p. 53). What is more interesting in this case is that this student was still in the preparatory stages of study abroad and had never left the USA in her lifetime – there appears to be a pre-effect before departure where students already turn a critical eye to their own culture. This particular student had already made social contacts with a Brazilian student who had come to study at her home institution, had the opportunity of being tutored by a Brazilian teacher in Portuguese, and had worked toward language proficiency with a Brazilian student from one of her institution's Brazilian university partners in a teletandem model of language delivery (Ellis, Abreu-Ellis, Bateman, Tabor, & Graham, 2010). Perhaps even more important is that, at the time of her saying this, she was only a few months away from departure to Brazil to study for a semester. She was facing the fact that she would live and partake in Brazilian culture for an extended period of time.

Once a student is exposed to another culture, the negotiation and self-reflection of comparing ones own culture to the new lived reality can be altering in terms of perception. This sort of dissonance that occurs in the mind because we presumably reference our culture most of the time as best, then have a chance to reflect from the outside on things that could change. A student teacher, while abroad in Tanzania, posted the following statement on her blog:

> While individual experiences still cause my eyes to widen and my jaw to drop, I have mostly recovered from the overall shock of the amazing differences that exist here. I truly feel a sense of "culture awe"! The way of life is "pole pole" (poh-lay poh-lay), meaning slow, and laid back. I can already see that it is going to be difficult to adjust back into American society, when that time comes. No one here is counting the minutes or excessively worried about time. Even though I'm incredibly busy and have taken on numerous responsibilities, I never feel overwhelmed or pressured by deadlines . . . The anxiety that I normally experience during the semester doesn't even exist here. It's impossible to feel anxious when people are so kind and happy. Some of my students recently informed me that the Tanzanian motto is "Uhuru na Umoja" (Peace and Love), although, for a while I was convinced that it was "No problem!" This is often the response to any inquiry or request. People are so accommodating, welcoming, and friendly that it is contagious. I have yet to meet someone that was in a bad mood or has had something negative to say. I truly admire the people that I have met here and have a genuine respect for Tanzania. I hope that am able to carry home some of

the values that are prevalent in this culture and cause them to be contagious in my own environment. (Friend, 2010)

This reflection is a good example of someone who was able to identify different aspects of culture, compare with their own culture, and embrace the difference. Further, she wanted to incorporate this aspect of life into her own existence and wished to share it and influence others upon her return home.

For this change in perception to occur, this opening of the mind, a negotiation of cultural meaning needs to happen. This is an exchange of information and a prerequisite trust and bond that occurs between the individual and individuals or groups of individuals in the host country. The follow excerpt from a student teacher's blog in Wales illustrates how cultural competency flows both ways:

> Today I taught the kids about Thanksgiving and how it began and what it means to be thankful. Then I took a small group of kids and I showed them a picture of a turkey (most of the kids had never heard of it, or had only heard of it as a country). I then had them create their very own turkeys using feathers, pipe cleaners and tissue paper. On their turkeys I had them write one thing they are thankful for. Many of the kids chose *Eid* for what they were thankful for. Since I'm in a multicultural school, many of the children recently celebrated *Eid* last week which is 3-day Muslim holiday. It was interesting to learn about their celebrations and then teach them about mine. We found many similarities and differences (especially in terms of traditional foods eaten during the celebrations). (Sweeney, 2010)

In this instance a space is opened in the classroom for cultural learning, both for the students and the teacher. There is a clear motivation to understand on both sides of the desk. Even though the curricular activity was one of a very American context when culture and diversity presented themselves the teacher opened space for discussion and attempted to better understand the lived reality of their students and found many similarities between the two cultures.

While students are doing their student teaching experiences abroad there seems to be stages of cultural development; an evolution of thought moving towards cultural competency. For instance, looking at the following observations taken from a student's blog in week two, week three, and week eight of a 12-week student teaching placement in Brazil, we see a drastic change in the focus of content of the student's narrative.

In week two, her observations are focused on that which is different or foreign. She focuses on her adjustment and discomfort:

> On a personal level, living in this apartment has really made me fortunate for what I have back home. It has been a struggle to get adjusted to brush my teeth with bottled water, shower with cold water that has no pressure, and air-drying my clothing. It has also been hard to adjust to the heat and humidity. (Meyerrose, 2011, February 6)

Otherness is a term that is used frequently to describe the awareness of difference. Often it is used to objectify another culture and, as a cognitive mechanism, to make rational the differences in the way minority cultures or subcultures function when compared with the majority culture without ever trying to understand the cultural significance of behavior or customs. A sense *otherness* is noted in week three of this student's student teaching placement, an awakening to the differences she is experiencing but with placing the onus on culture, when she observed cultural differences between Brazilian and American students in the following newspaper interview:

> [Brazilian students] are very social; [they] are very close with one another. They have gone to the same school for years so they're very comfortable and close with their classmates. This is good, but they're very social and it takes a while to adjust to that. (Eakin, 2011, February 24)

By week eight she has moved beyond the differences to realize that:

> I thought I would be intimidated by students in a foreign classroom, but I am starting to see that education is the same no matter where you are. Schools and students just have different ways of doing things! (Meyerrose, 2011, February 19)

In the final instance, she has moved away from the idea of *otherness* where she objectifies the other culture to realize that independent of differences, children are children, no matter where they are geographically. As Kissock and Richardson (2010) observed, "while the culture of every school is unique, experience working in schools around the world affirms the truism that schools are schools, teachers are teachers and students are students" (p. 98). In self-refection she further decodes the growth she has gained from the experience:

> While I have been down here, I have had positive and negative moments. Sometimes, I have wanted to just sit down and cry, while other times I have wanted to share with EVERYONE how good of a day I had with my students. These good times and negative times have had an impact on my student teaching experience. Each moment I have helps me grow and transform into the teacher I want to be.This experience has given me different challenges to face than if I would have stayed in [my home state] to complete my student teaching. Dealing with the obvious challenges of cultural diversity and communication have given me the experience I need to efficiently handle diversity and communication when I have a classroom of my own. (Meyerrose, 2011, March 5)

This particular student teacher had never traveled outside of the USA prior to her student teaching experience. By participating in such a program she placed herself in a situation where she actively suffered the burdens associated with being a cultural minority; struggling in communication and having different behaviors than the cultural majority - for instance, in social greetings it is customary for Cariocas (inhabitants of the city of Rio de Janeiro) to mock kiss both cheeks. This was a culturally different behavior for this particular student from the mid-west. She left the USA for this experience abroad having some technical knowledge of cultural and the expectation that she would have language issues outside of the school environment but, as Colón-Muñiz, SooHoo, and Brignoni (2010) observed, did "not have an embodied frame of reference on what it is like to be an "other" in a foreign country" (p. 71) having not had previous opportunities to travel abroad. This is very well illustrated in the following student teaching blog except taken from a teacher in Ghana:

> I know the kids have enjoyed me in their classroom. They are always crowding around my desk and hanging on me during their break times. They always have something to say about me being white. Like one little girl said she saw my mother in church and I said to her that it could not have been my mother since she is in America. So I explained to the little girl that just because the lady was white does not mean that she is my mother. I have heard several stories like this during my time with the students. (Pesch, 2010)

As Colón-Muñiz et al. (2010) further noted, student teaching abroad serves as a catalyst to move them toward cultural competency in that they:

> View the classroom from the students' perspectives, not solely their own. They recognized the importance of valuing the children's cultural capital. They shared their new consciousness for avoiding stereotypical assumptions about the international community and the need to know their immigrant students better, as a result. As important, they viewed themselves as more competent in using effective second-language pedagogy not only to support students linguistically and academically, but to expose them to the world community. (p. 69)

Thus, Colón-Muñiz, et al. (2010) allude to idea that there is a lasting effect on the individual who participates in a study abroad experience. We turn are attentions to this topic next.
In questioning teachers, one to five years after a student teaching abroad experience, on their perceptions of how this experience impacted the way they see diversity and how they assimilated it in their teaching practices, one teacher noted:

> Working with native Spanish-speaking students made me much more sensitive to the linguistic aspects of teaching, and prepared me to work with ESL [English as a Second Language] students. Since students in Ecuador are also much less regimented than students in the States, I learned how to lower expectations for specific student behaviors such as raising your hand or walking in a straight line. I became much more liberal in my approach.

This statement has important implications. Many teachers may enter the teaching profession believing that students must conform to their expectations and practices. The idea is that the students must learn how the teacher works to function in the classroom environment and be successful. The stark contrast here is that this teacher has learned that she must adapt to her students and the way they function in order for them to learn and be successful. In recent years in the USA, this epiphany that teachers need to adapt to their student's ways of learning have started to manifest in state level standards. For instance, in North Carolina, teachers are expected to be able to "adapt resources to address the strengths and weaknesses of their students" (North Carolina Professional Teaching Standards Commission, 2007, p. 3) and "adapt their practice based on research and data to best meet the needs of students" (p. 4). The teacher further noted that:

> When I step in front of a classroom, I understand that the children can come from similar or much different backgrounds to mine. Before my [student-teaching abroad], I was more assuming in relating the children's background to where they were from. The way I listen and talk to the students has changed as well. I am less presumptuous in my speech and more eclectic in my lesson planning and research.

This is congruent with the idea that "successful teachers present information in such a way that the majority of the class is challenged, yet can be successful. They adapt the assignment to meet the needs of the students who are either functioning higher or lower, or who simply need the material presented differently" (Stronge, 2007, p. 70). This notion of adaptability further expands out into this teacher's greater functioning with parents and community stakeholders in the school in Ecuador where they continues to teach:

> I try to work the lessons I have learned into how I treat students and their parents, and how I interact with them. I have learned to be more affectionate and feeling in my approach, as Ecuadorian society places a high value on family, and is very open and welcoming to others. Ecuadorians have little concept of personal space, and there is no stigma placed on friendly touch. They hug often and greet each other with a kiss on the cheek. The open what's-mine-is-yours approach makes interactions feel less formal.

What becomes evident is that student teaching abroad can be a catalyst to move teachers toward cultural competency because they are (a) exposed to the dissonance associated with having to live abroad for a time much longer than they may have spent before, (b) must adapt to both language and culture in many cases which makes them experience being a cultural minority, (c) have the opportunity from this prolonged exposure and these challenges to have the realization that independent of cultural nuances humanity holds some very large similarities across cultures, and finally (d) having realized this choose to better serve those of diverse backgrounds in their own classrooms, and (e) expose children in their classrooms to the validity of other cultural knowing and perspectives.

162 - New Teachers' Working Experience: A Secondary Analysis of TALIS

Caroline Rizza

Centre for Research on Education and Lifelong Learning, Econometrics and Applied Statistic Unit, Joint Research Centre, European Commission, Italy
caroline.rizza@jrc.ec.europa.eu

Abstract: Determining and understanding the challenges faced by new teachers and their corresponding support needs is a major issue for policy development and for addressing quality issues that many educational systems face. *"How well are new teachers equipped to face the challenges they encounter in the classroom and achieve their school tasks/activities?"* is the research question of this paper. The analysis uses TALIS data and the results constitute the first step of an on-going research project on new teachers and teacher education and training. The paper provides descriptive statistics related to 1) The new teachers and their activities in the classroom and in the school, 2) The challenges they face and the support mechanisms they benefit from, and 3) The new teachers' perception of their working environment. When relevant, the results will be discussed in light of the similarities and differences between the new and the more experienced teachers.

Keywords: New teachers, teacher professional development, TALIS, challenges

INTRODUCTION

Recently, a growing interest in recruiting and keeping new teachers has surfaced in response to the high attrition rate of this professional group in many countries (OECD, 2005). Between 30 and 50 percent of teachers leave the profession during their first 3-7 years of teaching (e.g. Achinstein, 2006; Darling-Hammond, 1997*; Schlechty & Vance, 1983). The main explanation underlined by research evidence is both the lack of sufficient and suitable support to keep teachers in the profession as well as the heavy workloads and poor working conditions new teachers face when they start teaching (e.g. Ulvik, Smith, & Helleve, 2009; Day, Stobart, Sammons, & Kington, 2006; Achinstein, 2006).

Throughout their teaching careers teachers develop competences by practicing and need training as well as support to undertake their work and to contribute to student achievement. The European Commission (2010) acknowledges that the working environments of teachers and the demands placed upon them by society are increasingly complex. Specifically, the EC states that *"(...) even initial teacher initial education of the highest quality cannot provide teachers with the knowledge and skills necessary for a lifetime of teaching. Teachers are called upon not only to acquire new knowledge and skills but also to develop them continuously."* (EC, 2010, p. 12). In this context, new teachers compared to more experienced ones, do not meet the same difficulties (or if they meet the same difficulties, they do not react in the same way since they are less experienced) and do not have the same training needs in relationship to their work. Determining and understanding the challenges faced by new teachers and their corresponding support needs is a major issue for policy development and for addressing quality issues that many educational systems face.

"How well are new teachers equipped to face the challenges they encounter in the classroom and achieve their school tasks/activities?" is the main research question of this paper.

As defined in the TALIS survey (OECD, 2009), "new teachers" refers to teachers in their first two years of teaching; "[more] experienced teachers" refers to teachers with more than three years of teaching. By "equipped", we refer to pre and in-service education as well as the support provided by principals and colleagues in the school (induction process, mentoring, appraisal and feedback). The analysis uses TALIS data and the results presented constitute the first step of an on-going research project on new teachers and teacher education and training. The paper provides descriptive statistics related to 1) The new teachers and their activities in the classroom and in the school, 2) The challenges new teachers face and the support mechanisms they benefit from, such as professional development, appraisal and/or feedback, and 3) The new teachers' perception of their working environment. When relevant, the results will be discussed in light of the similarities and differences between the new and the more experienced teachers.

The paper is structured as follows: Section 2 presents the theoretical background, Section 3 describes the methodology and Section 4 presents the findings. Section 5 discusses the results and concludes by pointing out future directions for the next steps of this research project.

BACKGROUND

Why focus on new teachers?

Recent researches in the area of teachers and teaching practices have highlighted the relevance of studies about veteran teachers' situations (Day & Gu, 2009). Nevertheless, the difficulties new teachers still encounter during their first years of teaching and their early departure from the profession support further investigations in order to better understand the challenges they have to face as well as the support or the education and the training they need.

The new teacher working conditions

New teachers in the United States and in most European countries are placed in high-needs urban or rural areas with particular student and family intake characteristics, including multicultural backgrounds low-income and, diverse language abilities (Castro, Kelly, & Shih, 2010; Achinstein, & Athanases, 2005). Achinstein (2006) underlines how new teachers are vulnerable in their school sites with the least desirable classrooms or students, insufficient supplies, insecure untenured positions. They are often placed in hard-to-staff-school and are constantly examined and inspected by administrators, colleagues, parents and students. These poor working conditions associated with heavy workloads are in contradiction with the research-based evidence stressing that the first teaching period experiences have the strongest impact on retention and that it is primordial to provide beginning teachers with a positive entrance into the profession (e.g. Rots, Aelterman, Vlerick, & Vermeulen, 2007; Ulvick et al., 2009). Ezer, Gilat, & Sagee (2010) analyze student teacher perceptions of teacher education and its contribution to their professional life based on a sample of 97 first-year new teachers who participated in an internship program. They found a low level of commitment to continue working as a teacher in the near future (half of the respondents) explained by the exposure to *"hardships"* and the low material rewards of teaching (Ezer et al., 2010, p. 401). Employment uncertainty and insecurity tenure are identified by new teachers as one of the main early professional learning constrained they face (Fenwick, 2011).

The "practice shock"

In the literature, the most quoted difficulty encountered by new teachers is the "practice shock" or the discrepancy between teacher education content, often due to lack of relevance, and the reality of the first classroom experience (Ulvick, et al., 2009; Achinstein, 2006; Flores, & Day, 2006). From their part, Ezer et al. (2010) stress the necessity to bridge the gap between theory and practice. They consider that new teachers *"must learn survival skills that were not part of their teacher education program"* (Ezer et al., 2010, p. 392). The consistency of the new teacher professional identity and the process it is built from their entrance in the profession play also an important role when it comes to take the decision to stay or quit the teaching profession. Comparing the differences between the metaphors chosen by new teachers to qualify their professional identity immediately following their graduation with those used after one year of teaching, Thomas, & Beauchamp (2011) shed light on the shift from seeing themselves as "ready for the challenge" to adopting a "survival mode". Then, the first year of teaching is a fight for survival through a deal with the reality shock (Kyriacou & Kunce, 2007; Ulvik et al., 2009). Achinstein (2006) highlights that new teachers need to explore, understand and take advantage of the so called *"micro-political literacy"* defined as *"an analysis of power, influence, conflict and control inside new teacher's organizational contexts"* (Achinstein, 2006, p.124). Indeed, by learning to read and understand the micro-political reality, teachers can adapt to it and act into it (Kerchtermans & Ballet, 2002; Achinstein, 2006).

For Sammons, Day, Kington, Gu, Stobart, & Smees (2007), teachers' identity is closely related to their professional and personal values, aspirations and changes in their sense of effectiveness. They identify three dimensions of teacher identity: the "professional identity", the "situated and socially located identity within a specified school, department or classroom" and the "personal identity" based on life outside of school. They show that each of these dimensions can affect positively or negatively teachers perceptions of their working conditions and practices such as resilience, commitment and effectiveness. New teachers' professional identity is heavily influenced by negative experiences (Smethem, 2007).

Teacher education, teacher training and new teacher needs

Even if teacher education cannot realistically prepare new teachers for all the situations they will meet, new processes and professional development phases such as induction or mentoring bring their solutions, advantages and disadvantages.

Sammons, et al. (2007) identify six teacher professional lives (respectively phases 0-3, 4-7, 8-15, 16-23, 24-30, 31+ year). The authors show that despite the number of common influences affecting teachers positively or negatively across their professional life phases, their impact varies with these life phases. Based on this, they claim that continuous professional development has to take place within professional, situated and personal contexts (i.e. the key-components of the teacher identity). According to them *"strategies for sustaining commitment in continuous professional development program should differentiate between the needs of teachers in different phases of their professional lives"* (Sammons, et al., 2007, p. 699).

According to Ulvik et al. (2009) new teachers need a space where they can reflect and not only act. The authors underline that the induction framework has to be thought and implemented in order to fit with the new teacher characteristics, his/her teaching context and has to be a fully integrated part of the school organization. Studying the first-three-year experiences of new teachers, Fenwick (2011) shows that the transition period between induction and post-induction is crucial and that support is still necessary after the induction process. In this context, schools have to become inclusive communities with a culture of sharing and teamwork (e.g. Fenwick, 2011; Ulvik et al., 2009).

Mentoring processes are also important but have to be implemented following certain specifications. For Achinstein (2006), mentors need knowledge related to how to read, navigate and transform the organizational contexts in order to offer new teachers a way to act in the political climate of schools, to address conflicts with colleagues, administrators and policies, and to move to define their own professional identity. Castro et al. (2010) consider crucial that problem-solving strategies and techniques become part of the new teacher training and that teacher educators foster peer-support groups by creating cohorts in teacher education and support teams for new teachers within schools.

In this paper, based on a secondary data analysis of the Teaching and Learning International Survey (TALIS), we will answer to the following question: *"How well are new teachers equipped to face the challenges they encounter in the classroom and achieve their school tasks/activities?"* by considering the following sub-aspects: 1) The new teachers and their activities in the classroom and in the school, 2) The challenges new teachers face and the support mechanisms they benefit such as professional development, appraisal and/or feedback, and 3) The new teachers' perception of their working environment.

THE STUDY

The OECD's Teacher and Learning International Survey: An overview

TALIS is an international survey focusing on the working conditions of teachers and the learning environment in schools. More specifically, TALIS focuses on lower secondary education teachers (teachers who, as part of their regular duties in school, provide instruction in programs at ISCED Level 2) and the principals of the schools where they teach. It provides data and analysis on the following key aspects of schooling: the role and functioning of school leadership; how teacher's work is appraised and the feedback they receive; teacher professional development; and teachers' beliefs and attitudes about teaching and their pedagogical practices. TALIS looks at these factors through the eyes of teachers and school principals. This innovative approach was chosen in order to examine how the intended school and teacher educational policies and practices are actually perceived and implemented in schools and classrooms.

Sample

Twenty three countries have participated in TALIS[41] and the data was collected in 2007-2008. In total, 71,619 teachers are represented.

In order to create two representative sub-categories "new teachers" and "more experienced teachers", we first focused on their background experience (see Table 1.).

---

[41] Australia, Austria, Belgium (Flemish community), Denmark, Hungary, Iceland, Ireland, Italy, Korea, Mexico, Norway, Poland, Portugal, Slovak Republic, Spain, Turkey, Brazil, Bulgaria, Estonia, Lithuania, Malaysia, Malta, Slovenia.

Table 1: Repartition of the sample per background experience

TEACHERS - Background experience	Freq.	Percent.	Cum.
This is my first year	2,004	2.80	2.80
1-2 years	2,971	4.15	6.95
3-5 years	7,963	11.12	18.07
6-10 years	12,267	17.13	35.19
11-15 years	10,524	14.69	49.89
16-20 years	9,362	13.07	62.96
More than 20 years	26,528	37.04	100.00
Total	71,619	100.00	

Based on this partition, we created the two following categories: the new teachers with less than 3-year experience (Sammons, et al., 2007) and the more experienced ones with 3 year-experience and more (see Table 2.)

Table 2: Repartition of the sample between the new teachers and the more experienced ones

Background experience	Freq.	Percent.	Cum.
New Teachers	4,975	6.95	6.95
More experienced teachers	66,644	93.05	100.00
Total	71,619	100.00	

As this stage of our research project, we did not focus on international comparisons. So, the different statistical weights related to each participant countries were not taken into consideration.

Furthermore, since the sample of new teachers is very small compared to the more experienced ones, comparison between the two populations will be presented only when it seems relevant for the understanding of the new teachers' working situations.

FINDINGS

The findings focus on the new teacher population (n=4,975). They successively present the new teacher population characteristics and its activities in the classroom and in the school; the new teachers' needs and the support mechanisms they benefit from and the new teachers' perception of their working environment.

The new teachers and their activities in the classroom and in the school

Among the new teacher population, 68.38% are women and 91.7% are under 40 years old (see Table 3.):

Table 3: Repartition of the new teacher population per age-groups

NEW TEACHERS - Age groups	Under 25	25-29	30-39	40-49	50-59	60+	Total
Freq.	1,309	2,202	1,051	349	57	7	4,975
Percent.	26.31	44.26	21.13	7.02	1.15	0.14	100.00
Cum.	26.31	70.57	91.70	98.71	99.86	100.00	

The majority of the new teachers have a bachelor degree (57.65%) and 26.97% a Master´s. When it comes to their employment conditions, only 42.05% of the respondents have a permanent position in his/her school (against 85.77% of the more experienced teachers). The majority of the new teachers (46.69%) have a fixed term contract for 1 school-year or less (against 8.51% of more experienced teachers). Finally, 66.53% of the new teachers have a full-time contract (66.53%) (see Table 4 & Table 5):

Table 4: Employment status, comparison in percentage between new teachers and the more experienced ones

Employment status	Permanent	Fixed term contract for more than 1 school-year	Fixed term contract for 1 school-year or less	Omitted	Total
New Teachers (percent.)	42.05	9.33	46.69	1.93	100.00
More experienced Teachers (percent.)	85.77	3.92	8.51	1.80	100.00

Table 5: Employment time, comparison in percentage between new teachers and the more experienced ones

Employment time	Full-time	Part-time (50-90% of full-time hours)	Part-time (less than 50% of full-time hours)	Omitted	Total
New Teachers (percent.)	66.53	23.10	9.13	1.25	100.00
More experienced teachers (percent.)	80.02	14.90	4.13	0.95	100.00

The new teachers' needs and the support mechanisms provided by schools

The new teachers' needs

In TALIS, teachers were asked to rate on a four-point scale their professional development need from "low level of need" to "high level of need" in different aspects of their activities in the school (see Figure 1). The two aspects of new teacher work that is on average most frequently rated by teachers as an area of high development need are "Student discipline and behavior problems" (32.52%) and "Teaching students with special learning needs" (32.4%). As it was underlined by the European Commission (2010) in an analysis of teacher professional development (without distinction of experience background), since the TALIS target population excludes teachers who only teach special learning need students, this finding is quite significant and probably reflects two actual trends in educational policy: the integration of students with special learning needs in mainstream schools and the increasing emphasis on equity.

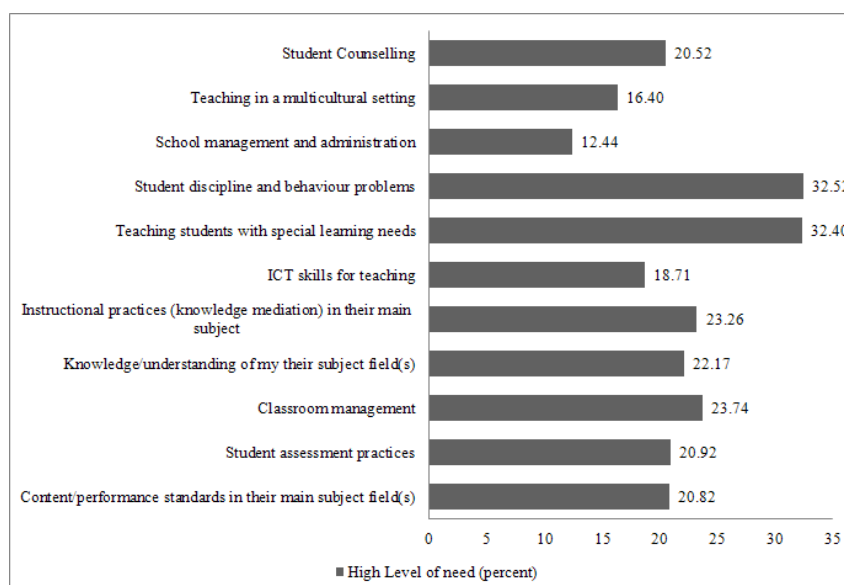
The others aspects in which, on average, a sizeable proportion of new teachers report having a high level of development need are: "Classroom management" (23.74%) and "Instructional practices in their main subject" (23.26%).


Figure 1: Areas of greatest development needs of new teachers (TALIS, 2007-2008)

It is interesting to present here the findings of the analysis of teachers' professional needs conducted by the European Commission (2010) in order to shed light on the specificities of the new teacher population.

Indeed, the European Commission (2010) has shown that on average across the 23 participating countries the aspect of teachers' work that is most frequently rated as a high level of need is "Teaching students with special learning needs" (32%); followed by "ICT teaching skills (25% against 18.71% for the new teachers) and "Student discipline and behavior" (21% against 32.52% for new teachers). "Classroom management" and "Instructional practices in their main subject" represent respectively only 14% and 18% of the new teacher respondents.

The support mechanisms provided by schools (see Table 6 & Figure 2.)
The majority of new teachers declare never having received appraisal or feedback about their work from the principal of their school (28.92%), their colleagues (27.46%) or external individual/body (62.47%).
Focusing on internal-school support, 19.46% of new teachers declare receiving an appraisal of feedback from their principal once per year and 15.96% three or more times per year. 17.63 % of the new teachers declare having received appraisal or feedback from a colleague three or more times per year and 13.85% monthly.

Table 6: Appraisal and feedback about new teacher work in their school

NEW TEACHERS - Appraisal or feedback	Never	Less than one every two years	Once every two years	Once per year	Twice per year	3 or more time per year	Monthly	More than once per month	Omit.	Total
Principal	28.92	3.10	2.17	19.46	12.42	15.96	8.56	6.17	3.24	100.00
Colleagues	27.46	3.30	1.63	10.73	9.69	17.63	13.95	11.88	3.74	100.00
External individual or body (percent.)	62.47	4.50	2.53	12.94	5.95	4.56	1.81	1.11	4.12	100.00

In TALIS, teachers were also asked to rate on a four-point scale the impact they received in their school on their situation in this school and on their activities in the classroom from "No change" to "A large change" (see Figure 2).
Figure 2: Impact of appraisal and feedback on new teaching activities and situation in their school

The comparison between the two extreme scale-points sheds light on the very low impact of the appraisal and feedback new teachers received about their teaching activity. The scarcity of this kind of support is then combined with their low impact.

New teachers' professional development (see Table 7.)
The majority of new teachers (71%) declare having participated in courses or workshops during the last 18 months preceding the survey, only 31% of them declare having benefited of mentoring or peer observation and coaching as part of a formal school arrangement. About one third of them has participated in a network of teachers formed specifically for teacher professional development (29%) and has conducted an individual or collaborative research on a topic of professional interest (33%).

Table 7: New teachers' participation in professional development activities during the last 18 months

NEW TEACHERS - Professional development activities during the last 18 months	Yes	No	Omitted	Total
Courses & workshop	71%	28%	1%	100%
Education conferences or seminars	41%	58%	1%	100%
Education conferences or seminars	26%	72%	1%	100%
Observation visits to other schools	21%	78%	1%	100%
Participation in a network of teachers formed specifically for the professional development of teacher	29%	70%	1%	100%
Individual or collaborative research on a topic of interest to them professionally	33%	65%	1%	100%
Mentoring or peer observation and coaching, as part of a formal school arrangement	31%	68%	1%	100%

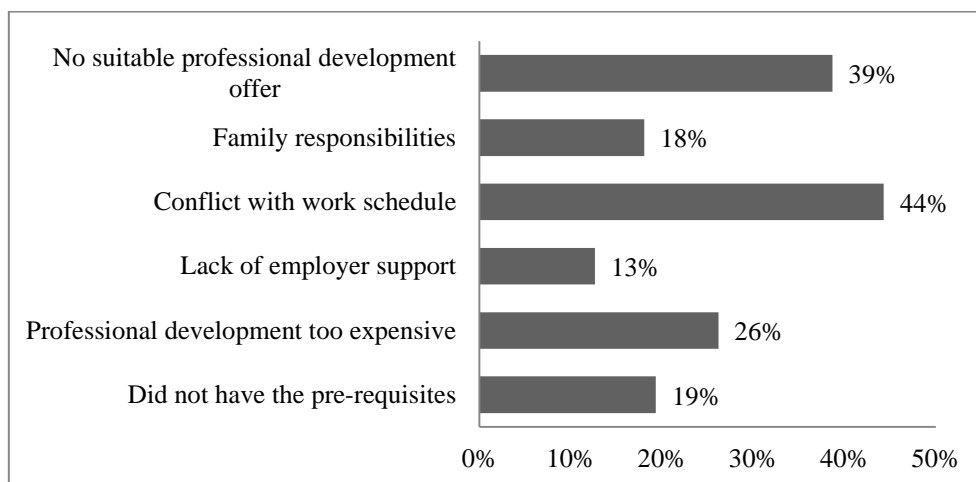
The majority of the new teachers (60%) affirm that they wanted to participate in more professional development than they did. Among these 60%, the main reasons they give to explain what prevented them from participating in more professional development than they did are "Conflict with work schedule"(44%); "No suitable professional development offer" (39%); and "professional development too expensive" (26%). The lack of employer support reaches 13% of the respondents and the "Family responsibilities" obtains 18% (see Figure 3.)


Figure 3: Reasons explaining new teachers did not participate in more professional development during the last 18 months

The new teacher perceptions of their working environment
The results regarding the new teacher perceptions of their working environment are not indicative of any specific problem (see Table 8.) In different proportions new teachers agree with the statements related with their situation about themselves as a teacher: 74% "Successful with their students of their classes"; 72% "Know how to get through to students"; and 61 % are "Satisfied with their job".

Table 8: New teachers' perceptions about themselves as a teacher in their school

NEW TEACHERS - Working environment perception	Strongly disagree	Disagree	Agree	Strongly agree	Omitted	Total
Satisfied with their job	2%	10%	61%	26%	2%	100%
Making a significant difference in the lives of their students	1%	8%	69%	21%	2%	100%
Making progress with even the most difficult and unmotivated students	1%	13%	59%	25%	2%	100%
Successful with students of their classes	0%	7%	74%	16%	2%	100%
Knowing how to get through to students	0%	8%	72%	18%	2%	100%

Regarding new teachers' perceptions of what happens in their school, almost one third of them (29%) disagree with the statement "Teachers in this local community are well respected" (see Table 9.). With the other statements, new teachers agree in different proportions.

Table 9: New teachers' perceptions about what happens in their school

NEW TEACHERS - Working environment perception	Strongly disagree	Disagree	Agree	Strongly agree	Omitted	Total
Teachers in this local community are well respected	7%	29%	51%	11%	2%	100%
Teachers & students usually get on well with each other	1%	10%	69%	19%	2%	100%
Most teachers believe that students' well-being is important	1%	6%	63%	29%	2%	100%
Most teachers are interested in what students have to say	1%	11%	67%	19%	2%	100%
If a student needs a special assistance, the school provides it	1%	9%	59%	28%	2%	100%

Finally, the new teachers´ perceptions of their class do not highlight specific difficulties but are not so clear cut positive (see Table 10.).

Table 10: New teachers' perceptions about their class

NEW TEACHERS - Working environment perception - The classroom	Strongly disagree	Disagree	Agree	Strongly agree	Omitted	Total
Waiting quite a long time for student to quieten down when the lesson begins	15%	45%	29%	8%	3%	100%
Students in this class take care to create a pleasant learning atmosphere	7%	28%	52%	10%	3%	100%
Time loss because of students interrupting the lessons	11%	41%	30%	10%	8%	100%
There is much noise in this classroom	15%	47%	26%	9%	3%	100%

Indeed, although the majority of the new teachers does not consider waiting quite a long time for student to quiet down when the lesson begins (45% disagree) one third of them claim that they have to (29% agree). In the same way, whereas the majority of the new teachers does not consider losing time because of students interrupting the lessons (41% disagree) 30 % agree with this statement. Although 52% of the respondents agree with the proposal stating that students in their classroom take care to create a pleasant learning atmosphere, 28 % of them disagree with this statement. Finally, 62% (disagree and strongly disagree) of the new teachers does not consider that there is much noise in their classroom.

DISCUSSION AND CONCLUSION

This study has described the working situation and conditions of the 4,975 new teachers having participating to the OECD's Teaching and Learning International Survey. Its purpose was to answer to the following question: *"How well are new teachers equipped to face the challenges they encounter in the classroom and achieve their school tasks/activities?"*.

The findings confirm the vulnerability of this population of teachers (Achinstein, 2006). When it comes to their employment conditions (Fenwick, 2011), only 42.05% of them have a permanent position and 46.69 % have a fixed-term-contract for one-school year or less. When it comes to their perception of the school working environment, one third of them do not feel well-respected in their local community.

New teachers seem to have specific needs in terms of professional development in comparison with the more experienced teachers. Among them, the needs related to classroom management and instructional practices in their main subject fields tend to confirm the "practice shock" described in the literature review (Ulvick et al., 2009; Achinstein, 2006; Flores, & Day, 2006; Ezer et al., 2010). This difference between the new teacher ideal of teaching and the reality they have to face (Kyriacou, & Kunce, 2007; Ulvik et al., 2009) also surface when it comes to their description of the perception of their class. Even though the majority of them have a good perception of it, the results show that this positive perception is not shared by all : although they do not constitute the majority of the respondents one third of them consider losing time because of student interrupting the lessons, waiting quite a long time for student to quiet down when the lesson begins or disagree with the statement "students in their classroom take care to create a pleasant learning atmosphere". Since the first years of experience have the strongest impact on teacher retention, the survey highlights that there is still a lot to do in this area.

With respect to the support mechanisms provided by schools to the new teacher population and its impact, the findings are quite negative and underlined the necessity for policy makers and the different stake holders to focus on this area. Regarding the crucial internal-school support (e.g. Ulvick et al., 2009; Fenwick, 2011; Alchinstein, 2006; Castro et al., 2010), the findings indicate their scarcity and their poor impact on teaching activities and situations in the school: the majority of new teachers (almost one third) declare never having received appraisal or feed-back from their principal or from their colleagues. Among the professional development activities they participate in during the 18 months preceding the survey, only one third of them claim having benefited from mentoring or peer observation and coaching as part of the formal school arrangement. Furthermore, among the 60% of the respondents that wanted to participate in more professional development than they did, 44% did not to it because of the conflict with the work-schedule, 39% because of the non-suitable offer, and 26% because of the cost. These findings confirm that new teachers need space where they can reflect and not only act (Ulvik et al., 2009) as well as the discrepancy of the support provided to them (Sammons et al., 2007).

Finally, the new teachers having responded to TALIS seem to have a positive perception of themselves as teachers and of what happens in their school since no specific difficulty surfaced, excluding the way teachers are considered in the local community (see above).

In light of these preliminary findings, the new teacher respondents in TALIS do not seem different from the new teachers considered in the literature review: they are vulnerable because of their employment conditions and the emotional situations they encounter in their working-day experience, the support they benefit from does not seem well adapted to their specific needs as "new teachers", and their perception of their working situation though globally positive, is tainted by some negative aspects. There is no way to know if these new teachers have stayed in the profession the year following this survey, but it is clear that a lot has still to be done by policy makers and stakeholders to respond to the needs of this specific population of teachers.

This paper is a first step of an on-going research project on new teachers and teacher education and training. The next steps will consider the national specificities of the respondents and will focus on analyzing the relationships between new teacher characteristics and their working conditions, needs, and perceptions.

167 - Who are the Teacher Trainers? A Gender Perspective [42]

Pablo Rivera Rivera[1], and Christian Miranda Jaña[2]

Universidad Austral de Chile, Chile
[1]Pablo_river78@gmail.com, [2]christianmiranda@uach.cl

Abstract: This article describes the Professional Gender Profile of Teacher Trainers, who participated in postgraduate program courses from primary schools. In addition, it intends to help the debate of professional development from the prespective of the teacher trainer, who is not considered when educational policies are designed. This research uses a quantitative descriptive methodology of censal character (N=363). The current study shows the performance of teacher trainer scientific production, and his/her personal profile features. The discussion is based on the current debate of the effective education and the gender role in teacher professional development.

Keywords: professional development, teacher trainer, educational professional profile, postgraduate program

INTRODUCTION

This paper is the result of a reflective process on the efficiency of permanent education based on research results. It is operationalized through enquiries in order to characterize the profile of the teacher trainer (TT). Two field areas are joined which are the teacher professional development and the Postgraduate Programs (PP) in relation to gender and teacher trainers. The (PP) are originated as a result of OCDE (2004) requirements in relation to teacher uncertainties when teaching the contents of second elementary cycles. The (PP) are designed in the year already mentioned, in conjunction with the Ministry of Education (MINEDUC) and universities which offer teacher training (Pilot Study). The proposal is conducted by the (CPEIP) which is the Center for Teacher Improvement, Experimentation and Research. It is directed to update the Curricular area (Miranda et al., 2007). A proposal is implemented in four Chilean Institutions of Higher Education as a Postdegree Program in Mathematics (PPMAT) and another on Study and Comprehension of Nature (PPECN).

In the year 2006, and as a result of a first satisfactory evaluation (Cancino, 2005), the rest of the Chilean Universities were invited to propose programs on the fields already mentioned. These Higher Education Institutions were also encouraged to create new programs on Study and Comprehension of Society (PPECS) and Language and Communication (PPLC). By the year 2007, seventeen post graduate degree programs were offered and from 2008, these program offerings were extended to all fields of elementary education. At present, there is an increasing interest in evaluating the efficiency of these programs. This interest could be observed in the studies of the authors like Frizt et al., (2008), González y Trebilcock (2007), and Miranda (2007).

Finally, the researches on the area are focused on educational program efficiency, but the field of Teacher Trainer investigation is left behind. According to the authors Loewenberg, Simons y Wu (2008) teachers are essential in the learning future opportunities of students, and become critical when the role of gender is added. In addition to this point, teacher trainer investigation is poor. The role of the Teacher Trainer is not understood not only in its impact on teaching teachers, but also on his or her personal and professional features.

CONCEPTUAL FRAMEWORK

The gender concept was addressed with the approach publication on Women and Development in order to define improvement strategies on social and economic class of women (Cooks, 2002). As a product of the former study, the concept category of "gender" is created and argued that the role of male or female is learned socio culturally independently of the biological features. Sex is inherited and Gender is acquired through learning. As a conclusion, women position in society is not biologically determined but culturally learned through the central role of school in this process (Arcos et al., 2007, Abramo, 2006; UNESCO, 2006; Andrade y Miranda, 2001; Cardaci, 1998; Bourdeau, 1967).

As a complement, according to Avalos (2008) the concept of permanent training is situated under the espistemic approaches which run the management of the formative processes related to teachers. On one side, the Deficit Approach and on the other, The Professional Teacher Development. The first one, emphasizes a vision of the teacher, who lack of competences and needs teacher training for a better performance. The second is oriented to the view of progress, where the educators are considered the holders of knowledge and previous experiences and engaged in a life-long learning professional process. While the Deficit Approach, emphasizes the incompetence of the teacher, due to his or her incapacities and lack of knowledge, the second values the abilities and capacities of the subject to help his process of development and strenghtening of them (capacities and abilities). This study assumes the Developmental perspective, in order to value the subject as a human being and professional in construction. The former idea is based on Huberman (2004, and Rivera 2008) which understands the process of permanent training as a life-long learning opportunity. (Jelbes, 2008; Villagrán, 2008; Quintero, 2008; Miranda et al, 2007; González y Trebilcock, 2007; Alvarado, 2006). In addition, the concept of professional profile is defined as the group of capacities, abilities and characteristics appropriately certified which permit that someone is recognized in society as a competent professional (Tabares, 2005; Hawes y Corvalán, 2005)

METHODOLOGY

The current study uses the quantitative paradigm with a descriptive study. The technic for information recolection is the life-story of the population in study which will be expressed in an instrument called Biography Chart. The Chart will be answered by the Teacher Trainers and included within the official proposals of the (PP). The information analysis uses the descriptive statistics (Miranda, 2007; González y Trebilcock 2007; Rivera, 2008).

The population is formed by 363 academicians who participated in the development of the PP with specialization in the second Elementary Cycle, from 17 Chilean universities. The geographic distribution of the study subjects is national (North to South), it implies that the TT are diverse geographically, culturally, socially and ethnically. 37 proposals were studied and divided into four groups, according to curricular area (PPMAT, PPCN, PPECS, and PPLC).

STUDY RESULTS

In this section, the results derived from the empirical study are described, analyzed and emphasized in the aspects related to gender. Gender focus of analysis is pertinent due to the debate related to the gap between the public and private education, especially in its access and quality of higher education. Besides of this, it is relevant due to the massive introduction of women into the labor market, being one of them the academy. It is observed that there inequalities and lack of opportunities for women and a male predominance in the job area. Chilean government wants to revert this situation through the implementation of new policies and measurements favoring femenine gender.

Next, Chart 1 and Graphic 1 show the results of the statistical analysis of the distribution of Teacher Trainers according to gender.

The masculine sample is higher in 59% over the femenine. The difference between them is 17% in both groups. Out of 10 Teacher Trainers, six are males. The reason male-women is 1,42. Cypher which shows a male numerical tendency, which contrasts with the total number of women elementary teachers of the country, in this case the proportion is inverse (Miranda, 2005). Next, in Graph 1, it is observed the gender according to the speciality of the post degree, where the team composition is of Teacher Trainers is shown.

The gender distribution by specialization of PP in Graphic 1, shows the masculine predominance in three of the four post graduate programs: PPMAT, PPECN, and PPECS. The exception is PPLC, where there is a feminine presence (71%), that means, 7 out 10 teacher trainers are women. According to the reproductive thesis, this phenomenon is related to the link between the femenine gender and the humanities (Bourdeau, 1967; Beyer et al., 2002). The same situation is replicated in the elementary education of this country, where the highest achievement in LC is a feminine conquer, and males in Mathematics and Sciences in national evaluations (Jiménez, 2008) in elementary education. This gender distribution, the team conformation of teachers, and the school results must be studied by specialists in the field. This study would not only be a contribution but also a future source of analysis.

The tendency TT profile is to obtain a tittle of High School Teacher (77%) with a Masters Degree in PP. Most of the studied population (77%) recognizes experience only in the classrooms of Higher Education, which in average are 17 years. Their role was teacher or in charged of Seminars (87%) and the program dedication is between 15 to 149 hours, which is considered low in relation to the proposal duration of 875 hours.

The PPECN shows an evident difference between the group of males and females, with a single experience in higher education. Males present a difference of 55 over 25 women who declare having experience in the classroom of higher education institutions only. The minimal presence of the women in the space of elementary education is a new analysis factor. This is not only to deepen how these professionals passed from one level to the other. One possible explanation is the one of the massive professional practicum as a main factor in the formation and teacher recruitment. Avalos (2008) shows the results of the projects on strethening of the teacher profession, where the early teacher practicums in the teacher programs, help a number of teachers to acquire jobs on supervision or colaboration in that area.

In opposition, the PPLC reverts the tendency of the former PP from a gender point of view. In this program, women (36) are located over a group of males (13) with experience only in higher education classrooms. In relation to the experience of more than one level in the educational system, women (19) are outstanding over males (10) in the area of humanities. The relationship between the levels is usually presented like a medium and higher level. In the following, the variables of title and degree describe the academic profile of the FF, and from the gender perspective provides clues over the possible explanations for the found differences in the distribution of the studied groups.

Table 1 describes the academic profile between the interaction of the professional tittle and academic degree in relation to gender. It could be obseved, that most part of the studied population earned the tittle of High School Teacher as an initial degree. Most of the FF who earned a Doctorate degree are males (54), in contrast to the femenine gender, who have the degree of Masters, the women TT with Doctorate are (28). The academicians who hold the title of Elementary Teacher (17) is the same in men and women. Most of them reached the degree of Masters, even though there are two cases of Doctoral Degrees, one in each gender.

There is no doubt that it is important to verify that the professional tittle is related with the academic degree and TT gender. It seems, that the studies on the history of the educative system evidences, there exist a tradition which relates more higher education with high school, instead of elementary (OCDE, 2004). From this study perspective (Cardaci, 1998; PNUD 2005), this is an element that confirms the Chilean Educational System as segmented where the male and female presence is hierarchically bstructured following the professional pyramide. Males have more presence in the summit (Coordinators-Doctors) and women in the base (Teachers-Masters) of the academic hierarchy associated to TT (teacher trainers).

From table 2, it is evidenced that the masculine gender presents 152 publications (60%) and the femenine 102 (40%). It means, there is a difference of 20 percentual points according to gender. On the other side, differences are not observed according to gender in the area of publications, detecting in both genders a higher number of publications in the area of the specialization. However, this general tendency, in the cases of PPMAT and PPLC education publications are detected. In the first case, the subject dealt with is education addressed by males and the secon by women. This last evidence, could be answered due to the political and curricular relevance they have in the chilean educational system (Miranda, 2007), this is expressed in standardized systems of evaluation and the lines of investigation in the teaching areas in the faculties of our country.

DISCUSSION AND CONCLUSIONS

The discussion considers the distinctive characteristics of the personal, laboral and academic antecedents of the TT (teacher trainers) who work in the PP emphasizing the gender and scientific production, measured in number of publications. The former, describes empirically the teacher instruction in Chile. This discussion is based on the education quality : (TT) which is one of the missing actors in the research.

The TT(teacher trainers) are formative proposals of "extensive" characteristics and its duration exceeds most of the formative permanent programs developed in the country, and they are only compared to Masters programs. In fact, the 18 months that lasts the program, make it an unusual proposal which in economical terms and in its results is important to research. That is why, a number of important recent investigations have made this program an object of study (Cancino et al, 2005; González y Trebilcock, 2007; Villagrán, 2008; Jelbes, 2008; Rivera, 2008; Quintero, 2008; Fritz et al, 2008). In that sense, there is a compromise need of academicians of Education Faculties and related areas of specialization of the PP. This is an instance for generating synergies and shared investigations (MINEDUC and Universities) in order to improve and respond to the needs of permanent training discovered by OCDE (2004) in relation to the insecurities detected in the use of knowledge by the teachers. This strategic link, should deepen the articulation of actions to fortify the teacher career and to integrate in a symetrical form the same teachers, as it was observed in the creation of standards of the MBE. On the other side, this investigation could confirm a personalized approach in the PP verifying a tutorial relationship (1 teacher trainer per every 3 elementary teachers). It was

established a system of seminars as a pertinent method. This is the same relationship which is observed in the post-graduate programs in the area of biological sciences and health (Miranda et al., 2008). These two factors introduce new elements in the discussion about the nature of the post-graduate programs in Chile (Ministerio de Educación, 2000).

The profile of the TT (teacher-trainers) was a central element of this study. An evidence of consistence is detected in the programs and areas of specialization respect to the emphasis in its disciplines (Ex. Mathematics) and professional characteristics of the teachers who work for them and their academic product associated (publications). In that sense, this study interprets that the specializations are an index of greater efficacy in the scientific production, instead of the amount of working teachers that elaborate the proposals. The former strikes the attention on the low productivity of the (Teacher-trainers) in indexed magazines, less than 1 in average per academician in all his/her academic life (in average 17 years working in the Higher Education). This point deserves more investigation, since it is an element of concern. A possible explanation to this evidence is that the theoretical frame verifies that there a few academicians that declare vocation for the scientific and investigative production in Chile (OCDE, 2008).

The personal and professional characteristics of the actors who perform in the processes of permanent training of teachers are an emergent element in the investigative experience associated to the teacher training. This is an emergent topic in the inter national bibliography on the efficiency of learning to teach with efficiency (Miranda 2005; Rivera 2008), the systematic investigation in teacher programs of curricular specialization has not been studied in this country. The examination showed differences among the specialization areas of study in scientific production and gender composition.

In conclusion, this study systematizes and opens new spaces for future research in relation to TT (Teacher-trainers) who work for permanent training programs in Chile and the relevance of the development of the teacher as professional. The intensification of efficacy indicators in the training programs and its impact on the professional and school learning must be central elements in the new fields of research. The new fields could be intervention projects and academic planification with the tendency of disciplinar training and generation of new scientific knowledlge to illuminate the efficiency of the educational practices.

179 - The Best Mirror is a Critical Friend: Pathways to Critical Friendship

John McKeown[1] and Michael Diboll[2]

[1]Mevlana University, Konya, Turkey
jmckeown@mevlana.edu.tr
[2]Bahrain Teachers College, University of Bahrain
mdiboll@hotmail.com

Abstract: Two Critical Friends tackle the "how" of Critical Friendship (CF) through an examination of artifacts, anecdotal evidence, and action research. This took place in the challenging, change-rich context of GCC (Gulf Cooperation Council) region education reform during the academic year 2009-2010. Using self-study and exploratory research methods, they investigate a dynamic CF process in teacher education, involving peer observation, consultancy, and reflection.

They outline the positive benefits CF brings to the enhancement of learning in a major Continuing Professional Development (CPD) initiative in Bahrain. This participatory, mutually-informing, critical friendship is scaffolded by processes noted during the collaborative relationship including context, content, and conduct.

Results of the study indicate that the CF processes, often running in parallel to established, formal work patterns, stimulate thinking about learning and lead instructors and facilitators to a different way of framing situations. This study demonstrates that CF establishes shared practice into a cohesive learning focus for productive action, and to a renewed pro-personal identity as educator.

Keywords: Critical friendship, professional development, pro-personal development, teacher identity, shared practice, community of practice

BACKGROUND

Bahrain Teachers College (BTC) opened to students in 2008-2009, and is the only 'professional' college in the University of Bahrain (UoB); that is, core ethos is focused on improving professional practice. In contrast, the UoB's old College of Education (CoE), which BTC replaced, was an 'academic' college: it emphasized theoretical learning over practice. BTC is a key part of a major, Kingdom-wide education reform initiative, which in turn is part of the 'Bahrain 2030' strategic vision for economic reform, supervised by the Crown Prince of Bahrain.

The start-up of BTC involved extensive international consultancy, the college's lead curriculum consultant being the National Institute of Education, Singapore (NIE). BTC is committed to diversifying approaches to education and assessment in Bahrain state-sector education, and its programs emphasize constructivist, collaborative, and discovery-based learning, reflective practice, 'active' student-centered learning, and continuous assessment using a variety of assessment methods.

This CF grew out of interactions at the BTC, in particular the Postgraduate Certificate in Academic Practice offered at BTC as faculty CPD by York St. John University, UK (YSJ). An M-level program, PCAP is accredited through the UK Higher Education Authority (HEA) and aligned to the UK Professional Standards Framework, leading to a fellowship of the HEA. PCAP provides a structured approach to professional development based on improving practice through critical reflection and modelling various teaching methods. Thus, capability, capacity and confidence are developed though the theorisation of practice and the practical application of theory.

The goal of the study is to share the development and maintenance of a critical friendship. As part of the PCAP program of studies, we decided to document our CF and to examine the effect it had on our work, research, and professional practice. These reflections serve as a useful base for exploring the "how" of CF: its processes, phases and identity, and to generate insights for further investigation.

Critical friendship

CF is a model of individual and collective action research that champions the co-construction of knowledge through collegial inquiry, conversation, and collaborative reflection within a climate of mutual vulnerability and risk-taking, trust and support (Cochran-Smith & Lytle, 1991; Bullough, Knowles, & Crow, 1991). Costa

and Kallick (1993) describe a critical friend as a trusted colleague who asks provocative questions, examines data and experience 'through another lens', and offers a friendship-based critique of a person's practice.

CFs take a view of their teaching practice whereby they critically appraise their development and provide supportive feedback for improvement. CF facilitates the bridging of two sometimes contradictory professional imperatives: the need to foster the tensions associated with learning, and; the need for friendly, empathic professional relationships. "It is only when you change the lens through which you view student learning – or your own practice -- that you discover whether a new focus is better or worse. But, if you never change the lens, you limit your vision (Costa & Kalllick, 1993, p. 49).

As Swaffield (2004) argues, there is a dynamic relationship between the two elements of the critical friendship relationship:

> ... critical friendship is not simply a balancing of the roles of critic and friend through emphasizing either pressure or support, but rather a richness resulting from providing both....Paradoxically, as "friendship" increases, involving the establishment and deepening of trust, so it becomes possible to increase "criticism" (p. 6)

We made a decision early on to follow Lima (2001) and conceptualize the relationship as potentially reciprocal and to stress its roots in an ethic of care and interdependence in teaching. As we reviewed the artifacts related to the development of our CF, we decided to include our voices as narrative directly inserted into the text to provide more of the flavor of the nuances and subtleties involved in the process, akin to the style of a Socratic dialogue.

> **John:** *"Critical", in terms of our CF, has a positive connotation such as "key" or "necessary". This freedom to put any educational topic or practice "on the table" was refreshing as it seemed as if higher education practitioners at BTC often talked around or avoided difficult issues rather than directly confronting them.*
> **Mike:** *Yes, we considered feedback in a number of different ways. "Warm" feedback consists of supportive, appreciative statements; "cool" feedback is more distanced and provokes thinking about the practice or raises questions; and, "hard" feedback is intended to challenge or raise concerns. Our process utilized time limits to make the best use of the available time we had and to help reduce interruptions. Often, we would meet off-campus.*

Review of Theory

The literature of critical friendship, although limited, falls into two categories: a competency model, and; a problem-based approach. In practice, both are complementary.

Hill (2002) introduces a competency model for framing CF, focusing on the requisite knowledge, skills and attitudes. Several categories of competency are conceived as learnable and practice-able in CF. The knowledge the CF requires is knowledge about a critical framework and how assumptions underpinning people's justification for their practices. CF skills are about reflective responding, scholarly reframing, investigative reframing, facilitated silence, encouraging documentation, encouraging the collection of data, scholarly reading, articulating an inquiry paradigm, big-picture facilitation and encouraging publication. The CF's attitude is intricately linked to beliefs about one's provision of critical friendship, and the value of reflection as a professional skill.

This model outlines some aspects of successful CF. However, as Zeera (2001) points out, "critical social science views methodology as inherently political, as inescapably tied to issues of power and legitimacy" (p. 58). Thus, values enter into the practice of CF within the methodological framework of qualitative research. The competency model appears to offer a deficit perspective; this may be problematic if this model is adopted without sufficient attention to the 'political' aspects of the practical context. As we shall see, these assumed a growing significance in Bahrain.

The problem-based approach addresses these problems: interactions come across as an equal dialogue among ready listeners, rather than as a struggle among contending interests. For example, Curry (2008) describes a "Critical Friends Group" which helps teachers involved with schools to work collaboratively in democratic, reflective community. This involves colleagues developing a shared mission, offering strong support, and nurturing a learning community. Curry finds that although there is development through the group, there are limitations to creating professional community through topic-based study: teachers have differing opinions of how critical friends should be and how friendly critics should be. Problems arise when teachers limit themselves to safe feedback, resisting criticism, productive feedback, or action. She suggests that

hierarchical relationships can make CFGs hard to put into practice. However, teachers with strong emotional support within the group can gain the confidence to expose and explore vulnerabilities (Curry, 2008).

Towndrow (2007) documents a study in which a teacher and he (as researcher) worked together to support and encourage each other to achieve outcomes that neither of the partners could have achieved by working alone. This study lays the groundwork for pedagogics of productive teacher professional interventions, comprised of systematic, structured attempts to generate desired change in teaching and learning, and enabling the transfer of a teacher's knowledge from one context to another:

> Grounded in the diverse literatures of organizational change, school leadership, action research, and reflective practice, critical friendship has been adopted by educators as a form of support for colleagues who wish or need to make improvements in what they do. (Towndrow, 2007, p. 4).

Towndrow models a pro-typical CF exchange framework as a cyclical process where the participants describe a practice, or ask for feedback with clarification sought from one or both sides, and the interpretations, questions or critiques offered, results in shared reflection.

> **John:** *As former school teacher and teacher trainer, I had mentored and been mentored, and even practised cognitive coaching. But CF's potent combination of discussion, peer observation, reflective practice and action research, provided support that allowed me to move my practice forward. It's interesting to note the ways that seemingly innocuous comments and incidents take on more meaning with a CF.*

> **Mike:** *Through sharing ideas and experiences, John and I are able to make connections focussed primarily on the learners' experience and needs. After a year working closely together, our CF was creative and synergistic, operationalized in a problem-based approach. The cumulative effect led us away from deficient practice; over time, our attention shifted from 'what we weren't doing' to a situational, relational and context-specific focus, that was far more positive and empathetic.*

> **John:** *In our discussions, particularly concerning the delivery of teachers' in-service CPD, I experienced a dynamic tension between existing and emerging practice, and that tension provoked my thinking; I was able to re-define my perspective in the specific context and reframe my understanding of our learners.*

METHODOLOGY

Self-study is characterized by an examination of the role of the self in the research project and the space between self and the practice engaged in. It is through written reflection and teacher conversations that we negotiate the tensions between ourselves and our respective identities (Bullough & Pinnegar, 2001).

While self-study research has "used various qualitative methodologies and has focused on a wide range of substantive issues" (Zeichner & Noffke, 2001, p. 305), the emphasis self-study places on reflection means it is highly compatible with exploratory research to enrich qualitative data gathering. Our hope was that by examining our own reflections and conversations during this period, we would understand more deeply the complexities of a developing CF. In addition to documenting and reflecting on our present actions in order to revise our future actions, we decided to employ narrative inquiry methods (Clandinin & Connelly, 2000) such as journaling, writing reflections, examining our correspondence.

For the duration of our PCAP action research (AR), we reflected on aspects of our projects in our reflective journals. To that end, we used narrative accounts to review the impact and significance of CF. Our goal was to document the CF as completely as possible through exploratory research. We wanted to avoid restricting our reflection on CF to describing previous studies. During this exploratory process, our originally vague concepts of CF gradually sharpened through the inclusion of our personal comments based on our reflections. When the AR was completed, we wrote retrospective experiential reflections as CF educators to provide sustained reflection.

Participants' descriptions

Despite differing backgrounds, both participants came to University teaching by circuitous routes.

> **Mike:** *A working-class Londoner, I left school in the mid-1970s with very little by way of formal qualifications; although 'bookish', I was deeply disaffected by the education system as it was then, and became involved in the 'underground' scenes in London. I continued reading, nevertheless, and*

spent most of the 1980's as a motorcycle courier and 'white van man'. In 1988, I embarked on access to higher education at Morley College, London, graduating a year later, and then took a four-year B.A. in English and Modern Languages, graduating with a first-class degree from the University of Westminster. While on a year abroad placement at the American University of Cairo, I took my first teaching qualification, a Certificate in Teaching English Language to Adults (CELTA).

I didn't have a chance to pursue postgraduate study because of family responsibilities; getting an income was paramount. But as I moved into interesting areas of ESOL, working with refugee learners at London education colleges, I began to feel the need for further qualifications in order to find suitable employment. So I began studying for my PGCE-TESOL at the University of Greenwich, taking advantage of local authority funding available for PGCE candidates at the Newham Community Employment Project, where I was teaching ESOL to refugee trainees, and to youngsters with learning and emotional difficulties. BTC is my third academic appointment. While I consider myself to be collegial, meeting John was a stroke of good fortune that allowed me to move forward both in my practice and in my educational research agenda.

John: *In the days before "American Idol", classical singing was a not deemed a suitable career path for a young man from Thunder Bay, Canada, of the 1970's. To assuage parental fears, I made a pact to take full-time vocal study only after completing a B.A. at Lakehead University, which I did. I sang as a tenor professionally for seven years. At the age of 28, I attended the University of Toronto to complete my teacher training (B.Ed.) and taught for 10 years with the Toronto Board of Education. I've worked abroad for 15 years in the UK, Turkey, Angola, and the Middle East, as a teacher, curriculum leader, and as both school and management administrator. During those years, I completed an M.A., Ed.D. and CELTA. Since the completion of my doctorate in 2005, I entered the educational scholarly dialogue through presentations at international conferences, writing articles, and interacting with educators. BTC was my first university teaching appointment.*

Mike and I met at BTC in August 2009, while serving on a committee tasked with revising BTC Teaching Practicum documentation. Mike's critical thinking and ability to get to the heart of an academic matter were of great benefit to the work of the committee. His written skills were impressive; he developed a summary on the role of reflective practice for inclusion in all TP documents. Through Mike, I was introduced to the concept of linguistic convergence and to various aspects of the Arabic dialect continuum, the place of Modern Standard Arabic (MSA) relative to the vernacular, and the implications of this for Arab students' second language learning.

Mike: *Once enrolled in the PCAP program, we were placed in respective study groups. For a number of reasons these never met: heavy teaching and service duties; issues connected to real and perceived status; extreme diversity in approaches to education and expectations of PCAP; a fear of engaging in the sort of honest and open discussion needed for real reflection to take place. John and I began meeting regularly to talk through our reflections, and in the process, started to include our respective Action Research (AR) topics in discussions. As we were both facilitators for Bahraini teachers' in-service CPD modules, we were well situated to collaborate. As I participated in his study, I was able to find additional information and investigative techniques to use in my own AR study.*

CONTEXT

According to Curry (2008, p. 735-6), CFs differ from other approaches to CPD. The latter often involve brought-in, outside experts offering generic, context-poor expertise, while CF's allow "insiders to construct their own learning through a cycle of inquiry, reflection, and action", which is context-specific to the practitioners' place of practice. This has the advantages of having "[a] direct link to institutional practice", "[creating] a low-stakes forum in which to explore politically charged reform topics", encouraging "constructive controversy" and "curtailed teacher isolation" (769). This resembles Schön's (1987) idea of collaborative "layers of reflection", which have the power to "transcend normal educational practice", leading to new forms of collaboration, process and practice (p.326).

BTC's evolving start-up context demanded an urgent move forward from brought-in external expertise, a "quick fix" frequently found in GCC-region education reform: the utility of such expertise is seriously constrained unless it can be reconstructed to suit the local socio-cultural-political context. This reconstruction can only be done by contextually aware practitioners 'on the ground' who are reflective

practitioners and action researchers: there is no 'off the peg' shortcut to such contextualization, and as our CF developed, we became increasingly aware of the power of CF as a tool to facilitate contextualization and reconstruction.

Further, BTC is rich in formalized situations in which practice is discussed and planning takes place. Thus, there are many traditional-style committees at BTC that adhere to a strict procedural format, and are perceived to be "high-stakes" gatherings in which it would be inadvisable to openly discuss topics deemed to be "political", or, "controversial". Accordingly, 'elephant in the room' issues often remain undiscussed. CF provided a highly effective way to overcome the lack of discussion of key issues.

The complexity of these interactions is further determined by a complex array of cross-cultural interactions that bring together North American, European, GCC, non-Gulf Arab, South Asian, African, and Far Eastern cultural practices, assumptions, and perspectives. This cross-cultural aspect to BTC's professional interactions is potentially a great strength. However, preventing it from becoming a key weakness required an enhanced level of cross-cultural awareness and communication. While the traditional management structures in place at the college struggled to provide this, we became increasingly aware of the potential of CF to facilitate inclusive communication, cooperation and constructive collaboration across cultures.

We found that CF relations provide a "low risk" forum for creative, experimental, and "low-risk" interactions around perceived "high-risk" topics connected to differences in organizational and national/ethnic culture in the developing context of professional practice at BTC. Of key importance is the diversity and mutuality of the CF, its "low-stakes" status, the fact that it is experiment-tolerant, honors diversity, and shares professional commitment, and concentrates on education reform (Curry 2008, p. 769).

> **Mike:** *Issues sprang from feelings of concern about teaching practice, particularly in the sessions where we both taught of the same course. I might, for example, meet with John informally during the working day, or in a phone call, to debrief a class or to "open up" what had happened at a meeting. I re-focused efforts for reform on practical aspects at the classroom level with the learners*

> **John:** *More formally, we'd meet to reformulate ideas for AR, or to share developing reflections or research. As the word limit was very tight for PCAP submissions, we worked together to compress our journal entries down to their essential aspects. In this atmosphere, surfacing previously-held assumptions and beliefs changed my approach to reform and the implementation of reform strategies.*

Component 1- Reflection

Modeling reflection is an integral part of the CF process, and an initial stage of binding ideas together with a colleague in deeper and substantially more significant ways. Classroom interactions, interpretations of texts, conferences with Teaching Candidates and colleagues, are all opportunities to model reflection. As Birmingham (2004) suggests, CF creates a safe space of freedom, security, time and space to take risks and ask important questions, and reflect. Even though reflection is fundamentally individual and private, it thrives best in a supportive environment. Explicitly bound to the particulars of situations and embedded within a community, it resists being reduced to a concrete measure of certainty. Through our association, we came to acknowledge that reflection is best not carried out alone.

> **John:** *For me, CF provides a mirror to facilitate reflection by knowing the context and, at the right time, feeding suggestions for further reflection. An additional benefit is that the quality of reflection is deepened, avoiding clichés and superficial responses, particularly in scholarly writing.*

> *It also adds to the richness of source. Mike was developing a CPD program which corresponded to my work in TP development. His concerns dovetailed with mine on a number of issues, including BTC context, cross-cultural communication, and decision-making. I came to see that I could sharpen my initial reactions to realities related to teaching and learning, and find ways to improve a situation or adapt to it.*

> **Mike:** *Back in the 1990s, getting to grips with RP changed forever the way I view myself as an educator. Re-visiting RP at BTC was a trip down memory lane. Although I had entered higher education through a 'non-traditional' route, I had a 'knack' for traditional university studies and thought a PGCE would be a walkover. I was mistaken, largely because of my PGCE reflective journal; I kept flunking it. Or at least, I perceived a 'referral' as a 'failure.' Focused on academic*

objectivity, 'reflection', or the journey into subjectivity as a prerequisite for action planning and self-evaluation, was utterly alien to me. I was hung up on 'technical rationality'. My struggle with my journal led me to the Schönian concept of 'reflective practice'; a seminal moment in my career as an educator. I was intrigued to get back to reflection, again. Realizing through my CF interactions with John that the 'technical rationality' paradigm is still largely unquestioned at all levels of GCC education, I was able to relate my struggles to get to grips with RP to the difficulties that many Bahraini students and CPD participants were facing in RP.

John: *I found that in the CF process, reflection became second nature. It had been years since I had the opportunity, or "luxury", of sharing thoughts in process, or practices "under development". Perhaps, the multi-cultural and multi-ethnic situation at BTC added to the need to talk through ideas completely and thoroughly, in a low-risk environment.*

Component 2 - Peer Observation

Following PCAP requirements, we completed two formal peer observations (PO) intended to provide feedback based on key aspects of practice: we were to focus on strengths, aim for aspects of improvement, and offer constructive suggestions and strategies when asked. Often in very hierarchical contexts, practitioners 'over prepare' for PO, so that observations become over-formalized, and offer an unrealistic and unrepresentative view of actual practice. However, with CF, PO quickly became a regular mutual professional development feature to the point where we could participate in each other's lessons on an impromptu basis. Of particular mutual interest were strategies used to re-focus opportunities for students to work together cooperatively in student-centered activities, in Arabic, using pairs and groupings, with more discussion time allotted in Arabic. PO opened our eyes to the support that is available for CPD, informally, incidentally and easily.

Mike: *PO has been a key strand of CF collaboration especially in CPD modules 'The Classroom Learning Environment' and 'Collaborative and Cooperative Learning', where we worked together on implementing teaching and learning strategies in a bi-lingual, environment and achieving what Giles refers to as linguistic convergence, and optimal or cultural convergence, in an Arabic context (Giles, 1979).*

John: *In the beginning of the CF, we invited each other to visit our respective classes to observe and provide feedback on specific aspects of practice. We became very comfortable coming and going from our CPD classes and developed a highly dynamic and creative working relationship that transcended mere PO and encompassed co-teaching, developing tools for students and tutor feedback, quality assurance and course development.*

Component 3 - Action Research

Given that we were both working full-tilt in a start-up organization, we acknowledged that a challenge to completing the required PCAP Action Research was restrictions due to heavy teaching and administrative responsibilities. This situation inhibits the formulation of a traditional "academic" research agenda. Accordingly, we found it necessary to integrate scholarship and research as closely as possible into teaching-learning activities, so that CPD sessions resembled what Schön has described as a "Reflective Practicum" (1987, p. 305), where through RP the practitioner becomes "a researcher in the practice context" (1983, p. 68). Schön's "reflective practicum", together with Louis Cohen's "action research" model provide a basis on which research activities can be factored into day-to-day classroom activities to the greater benefit of both participants and practitioner.

Apart from being more time-efficient, this approach has advantages. It breaks down the artificial barrier between theory and practice, the "practical" and the "academic"; it locates the research in context (Cohen, Manion, & Morrison 2007, p. 3); it ensures that the research feeds directly into practice, improving understanding and practice as an integral part of the research (Mcniff, Lomax, & Whitehead 2003, p. 124), and; it gives voice to students and participants, reducing the risk of them becoming mere "research objects" of the technically-rational "expert".

Mike: *Research-in-action allowed me to integrate activities such as demographic data gathering, course evaluation, participant and facilitator satisfaction surveys as closely into my practice collaboration with John and other colleagues for a number of activities (my AR topic was localizing*

externally-derived CPD). John was examining the use of study notes with first-year B.Ed. candidates. By working together, we found commonalities and connections in areas of linguistic convergence, motivation, and attitudes to the use of English language, throughout a wide range of teachers and teacher candidates.

John: *Data collected about student use of study notes, and the use of online survey e-tools, like Surveymonkey, were both mutually informing, and mutually beneficial. In the process, Mike and I found that many of the activities supported research **and** practice. The research grew organically out of the AR. It is interesting to note that we both generated and produced publishable research based on our combined efforts and have presented our work at four international conferences. This would not have been possible working in isolation.*

Conduct

To create trust, deepen mutual respect and avoid potentially awkward misunderstandings, we found it reasonable to establish a few ground rules:

- focus on the principle not the personality (whomever may be involved)
- confidentiality must be respected (confidences shared need to be discussed on their merit)
- learning needs of students were the top priority (teacher issues framed in this context)
- aim to be as specific as possible when giving feedback
- frame questions without a pre-conceived outcome (openmindedness)
- avoid blaming students or social conditions (context focussed)
- listening is as important as sharing ideas
- adhere to scheduled times for meeting
- be on time and prepared for each session

This distinction of process might be easily adapted to different circumstances and tailored to different individuals. The process we developed includes:

- sharing issues and providing context,
- making an overview with specific observations,
- defining issues and framing questions,
- taking time and space for reflection or discussion,
- de-briefing the results.

Roles were fluid and alternated between that of counselor, provocateur, coach, cheerleader, encourager, time-keeper (and due-date-enforcer), to secretary and record keeper.

Mike: *Such was the level of collegiality and trust that I felt confident and able to observe, co-teach, and provide feedback on a session with little or no notice. This enabled us to mutually reinforce and enhance our practice by sharing, using specific support, defining context, and by providing feedback involving theoretical insights to inform practice, that is the "underpinning knowledge" of practice.*

John: *It wasn't just the conduct of our CF but the value that we attached to it. Our shared quality assurance activities including mid-term assessments, final assessments, surveys, participants' and tutors' feedback, undertaken both as part of our duties as educator-managers at BTC and for PCAP AR, was direct, specific and immediate. Our conduct was a model for students who were impressed that their instructors were "learning" together and that they were able to articulate and share that learning.*

DİSCUSSİON

In the present GCC context, it's very common for practice in higher education to become individualized and competitive. In our experience, whilst community service involves hours spent on many committees, there were not corresponding structures in place whereby colleagues could share and discuss experiences in a non-judgmental and constructive manner. Extending and developing CF groups, with procedures for regular peer observation, could be a way forward to increased collegiality and shared practice. We now both feel more confident to focus on creating spaces for low-risk discussion with colleagues.

John: *I was revitalized in this process and feel fortunate to experience what the "push and pull" of a CF can impact on my teaching, learning and classroom practice. It's amazing how powerful that kind of accelerated learning can be if we allow ourselves to both lead and follow. CF's determine their professional learning needs and this form of CPD is much more satisfying both personally, and professionally.*

Mike: *By establishing a CF, I opened the door to more effective relationships with colleagues; I experienced a deprivatization of practice! I was able to reach out to colleagues by collaborating across different disciplines, by confronting assumptions and expectations, and by knowing my own, better.*

John: *I agree. CF was sustained professional development, based on a spirit of inquiry. From responses collected from students as part of my action research, my teaching had significantly improved and improved the learning environment and their learning experience.*

CONCLUSİONS AND İMPLİCATİONS

This study provides higher education practitioners anecdotal evidence of a CF in practice, and articulates the benefits of participating in a partnership that is organized along these transformative lines. We hope this paper will prompt further discussion about the specific ways in which CF can be systematically applied, and reasons for supporting the implementation of CF, and what some of the benefits might be in return for investments of time, effort, energy and funding.

By consciously examining CF through exploratory research and self-study, and by reflectively engaging in collaborative teaching, we enhanced our skills as co-instructors and colleagues, and renewed our commitment to working with other teacher educators. By reflecting on both this project and our teacher education practice generally, we developed deeper understanding of our research findings, identified possibilities for action research in teacher education, and examined closely our beliefs and practices as teacher educators. By incorporating journaling and other forms of reflection into our research methodologies and data collection, we experienced greater understanding of ourselves as practitioners.

While CF can never replace more traditional structures in education management, it can provide a parallel forum in which ideas and practices can be discussed and negotiated in a more creative, dynamic, and experimental manner than is possible with more traditional structures. While CF can never replace more structured forms of CPD, it can supplement these by enabling practitioners to more fully and deeply explore the applications and implications of their CPD.

All in all, our experience in developing CF as part of BTC CPD confirms Curry's observations (769) that CFs provide a safe space for creative, experimental, and low-risk interactions around perceived high-risk topics connected to differences in organizational and national/ethnic culture in the developing context of professional practice of BTC. The mutuality of the CF, its low-stakes, experiment-tolerant status, and its shared professional commitment focused on education reform make CF highly relevant to the dynamic, change-rich, cross-cultural context of the Bahrain education reform project, where 'off the peg' consultancy will only ever be an approximate fit, and 'bespoke' can only come from the practitioners themselves. When it comes to ensuring that our tailoring of teacher training best fits the needs of our student body, critical friendships can often offer the "best mirror" for reflection.

Afterword

We have said that the BTC context of our CF was 'change-rich', and have alluded to some of the challenges that education reformers faced in the academic year 2009-10.

Reflecting from the perspective of the events of the 'Arab Spring' of 2011, it strikes us how the challenges we faced at BTC presented in microcosmic form challenges being faced by the wider Bahraini society and tensions within it: tensions arising from implementing 'Theory Y' reforms in contexts where 'Theory X' (McGregor in Biggs & Tang, 2007) remains default; rival visions of Bahraini identity and the limitations of those identities; regional influences from outside of Bahrain; civil rights and equality of opportunity; the interaction between social class and ethno-confessional background; the changing aspirations of women; different generational perspectives; the tension between the desire to conserve what is local and traditional, and to embrace globalization; crises of representation and legitimacy.

Naturally, since education cannot be separated from its contexts, the 'small p' 'political' issues within the college reflected the 'big P' 'Political' issues in the wider society without.

If Bahrain is to heal, then education reform initiatives needs to continue, informed by profound reflection upon the reform's strengths, weaknesses, opportunities and threats since its inception in 2008. It is our shared belief that critical friendship -- creative, experimental, and low-risk -- offers a way forward to facilitate healing, mutual respect and understanding, reform and development in education, in other professions in Bahrain, and in the wider Bahraini society.

Abstract: This paper grew out of the observation that there is little evidence as to whether the changes happening within the New Public Management paradigm and entrepreneurial orientation adversely or positively affect Portuguese academics' work and careers. Using Psychological Contract as a framework to characterize and explain the relationship between employer and employee, we have conducted six exploratory interviews with academics working in a public higher education institution. According to the interviewees, the university is not fulfilling its side of the deal. They describe the main perceived breached contents and report episodes of organizational (in)justice, as well as an unprecedented degree of peer competitiveness and increasing individualism.

Keywords: Higher education; employment relationship; psychological contract breaches; implications

INTRODUCTION

Profound transformations concerning the nature of the academic work and the academic career are now taking place, such as increased competition, diminished funding, increased accountability, and new performance appraisal practices (Altbach, 2000; Taylor, 2001; Chandler, Barry, and Clark, 2002; Deem, 2006). In Portugal, these changes are inevitably linked to the introduction of new types of governance and market-driven policies (Santiago & Carvalho, 2008).

It is argued that the transformations and pressures for competitiveness, that are also permeating the academic career, have not only changed the internal structure of organizations but also the nature of the employment relationship, often framed within the concept of Psychological Contract (Lester, Claire, & Kickul, 2001). Additionally, these recent trends have increased the perception that the (traditional) terms of the psychological agreement (for instance, job security) are not being effectively fulfilled (Coyle-Shapiro & Kessler, 2000; Aggarwal & Bhargava, 2009). In a context of significant changes and increased uncertainty within Portuguese academia, the perception of contents and violation of the Psychological Contract (PC) becomes increasingly important for both universities and academics. Nevertheless, the impact of the changing scenarios in academic organizations and career has not been fully acknowledged. Thus, our aim is to contribute to this field by reflecting upon key aspects of the recent managerial and career reforms, and to derive some conclusions in terms of PC contents and perceived violation of such contracts.

This paper is divided in five main sections. The first intends to contextualize the study, by identifying the major changes within the reform of higher education, and highlighting some main features of the contemporary (Portuguese) university. The second section explores the PC of academics and its potential breach/violation following the on-going reforms. The third section presents the methodological strategy. The fourth is dedicated to the presentation of empirical results and its discussion. Finally, the fifth draws some conclusions from the on-going reforms in higher education and how those changes are affecting the academics' profession and the PC.

THE PORTUGUESE ACADEMIC CONTEXT

As Altbach (2000) underlines, the traditional idea of the professor who holds a job for life, focused on teaching and research, and carrying a responsibility for institutional governance, is giving way to alternative perceptions of the employment relationship with fewer fulltime and permanent positions being made available. In this regard, we can pinpoint some major trends in Portuguese institutions of higher education.

A culture of accountability has emerged as a central feature of the managerialist reforms, with implications for the academic profession. The assessment of academic work is an increasingly common practice and teaching, research, administrative, and management work are becoming regular activities for academics (Altbach, 2000; Sikes, 2006). Portuguese higher education institutions have recently experienced career reforms with significant implications on the traditional terms and conditions of academics' jobs. The

evaluation criteria for achieving tenure are becoming increasingly rigorous; there are fewer vacancies for upper positions and the possibility of achieving one is progressively more related to the number of published papers in peer reviewed journals. Precariousness is an issue for every academic, especially for those occupying the lower ranks in the academic hierarchy (Santiago & Carvalho, 2008).

A qualitative study focused on Portuguese academics' career development, work values and the work-family relationship, shows that some changes are taking place in the name of competitive performance (Santos, 2007). Academic organizations are depicted as arenas of efficiency with objective standards of work performance, and adopting a discourse of competitiveness and market-orientation resulting in a long work hour's culture. In this respect, research conducted in the Portuguese academic context by Santos and Cabral-Cardoso (2008) portrays some stories of daily organizational processes and cultures of power and authority through which people are exploited and violated. These examples can also be analysed in the domain of organizational deviance and/dysfunctional behaviours.

Acknowledged the changing scenario of Portuguese academics' career endeavours, a question arises: what can be expected in terms of their employment relationship? What are the implications of these changes? To answer these questions, it is urgent to acquire a deeper understanding of the magnitude of the changes occurring in academia. Using the concept of PC and its violation/breach, we intend to trace a parallel with the existent literature on this area. Existing research suggests that employees tend to react negatively when they perceive a violation of their PC. They usually respond with lowered commitment and trust, and increased tendency to adopt counterproductive behaviours (e.g. Robinson & Rousseau, 1994; Lester et al., 2001; Rousseau, 1995; Vardi & Kim, 2007; Chiu & Peng, 2008). However, the consequences of the recent changes of the PC of Portuguese academics are yet unknown.

THE ACADEMICS' PSYCHOLOGICAL CONTRACT: CONTENTS AND BREACHES

Psychological Contract refers to understandings that employer and employee have about mutual promises/obligations included in the employment contract. It is an individual perception about what is owed and received in the employment relationship by each constituent of the contract and, as such, it is perceptive, subjective, and idiosyncratic in its nature (Robinson, Kraatz, & Rousseau, 1994; Herriot & Pemberton, 1997).

This concept has been used as a framework to examine and make sense of the changing relationships between employers and employees. The PC seems to help both parties reduce insecurity in some situations, regulate their behaviours and expectations, fulfil some gaps of the formal employment contract, and provide individuals with a sense of influence in certain events (Robinson et al., 1994; Aggarwal & Bhargava, 2009).

The importance of the PC held by organizational members also derives from the perception of breach/violence, since it affects aspects of the relationship that are crucial to employees and their employers (e.g. Robinson & Rousseau, 1994; Robinson, 1996; Turnley & Feldman, 2000; Coyle-Shapiro & Kessler, 2000).

The Contents of Academics' Psychological Contract

Although the PC comprises the perception of what the employees perceive as being their obligations to the employer, and of what they perceive as being the employer's obligations to them, we will focus on the latter. There isn't much empirical evidence dealing with the PC of academics. However, some recent empirical studies have been shedding some light on what may be the content of it (Aydin, Yilmaz, Memduhoğlu, Oğuz, & Gűngor, 2008; Krivokapic-Skoko & O'Neill 2008; Shen, 2010).

Previous studies suggest that the academics consider the following issues as employers' obligations: ensuring career development and access to relevant training; promoting fairness and justice regarding promotion, payment issues, and the distribution of the workload; providing support with personal problems; good workplace relationships and working conditions, and long term employment; and finally, tasks and activities that demand higher responsibilities, autonomy and recognition (Tipples & Krivokapic-Skoko, 1997; Aydin et al., 2008; Krivokapic-Skoko & O'Neill 2008; Shen, 2010).

The Psychological Contract Violation/Breach

The distinction between breach and violation seems to be a matter of degree: breach is a cognitive assessment of the organization's failure to fulfil one or more contract obligations, whereas violation involves a deeper feeling of betrayal, once the individual believes that the organization failed to maintain the PC, and shows feelings of anger and frustration (Morrison & Robinson, 1997). However, the perception of PC breach (cognitive assessment) may not necessarily lead to violation (intense emotional state). Traditionally, PC

violation and breach have been studied in terms of the employees' perception of their employers' unfulfillment of the promised obligations.

The violation of the PC implies the perception of a discrepancy or imbalance of obligations and promises in the exchange relationship with one's employing organization (Robinson & Rousseau, 1994; Robinson & Morrison, 1995) with detrimental effects on employees' attitudes and behaviours. Specifically, violation or breach can be experienced when a discrepancy is perceived between an expected outcome derived from the promises made by the organization, and the actual fulfilment (or failure to do so) of those promises (e.g. Rousseau, 1995).

PC breach/violation is shown to have detrimental effects on various work related behaviours and attitudes. Specifically, previous studies suggest a negative impact on performance, turnover, trust, job satisfaction, intention to stay, commitment, organizational citizenship behaviour, and deviant behaviours (Robinson & Rousseau, 1994; Robinson, 1996; Coyle-Shapiro & Kessler, 2000; Turnley & Feldman, 2000; Lester et al., 2001; Johnson & O'Leary-Kelly, 2003; Raja, Johns, & Ntalianis, 2004; Suazo, Turnley, & Mai-Dalton, 2005; Deery, Iverson, & Walsh, 2006; Vardi & Kim, 2007; Bal, DeLange, Jansen, & Van Der Velde, 2008; Chiu & Peng, 2008).

Some studies define as antecedents of perception of breach/violation: initial trust in the employer, type of organizational restructuring, type of employment contract, levels of organizational and individual performance, and a few dispositional variables (e.g. Robinson, 1996; Robinson & Morrison, 2000; Raja et al., 2004).

The perception of a lack of willingness on the part of the organization to fulfil its obligations and the possibility of doing so are the general sources of PC violation (Morrison & Robinson, 1997; Robinson & Morrison, 2000). The authors argue that perceiving a gap between what was perceived as promised and what was actually received depends of the salience of the issue at stake and the level of employee's vigilance and scrutiny of the organization's contract fulfilment. Turnley and Feldman (1999) suggest that specific contents of the PC (namely compensation, job security, training, and career development issues) contribute to the perceived degree of violation, and some individual variables (namely affectivity, sensibility to equity, and conscientiousness) as well as labour market forces (exit costs, replace ability by the employer, and availability of good job offers) contribute to strengthen the employees' reactions after the perception of PC violation.

This exploratory study seeks to uncover Portuguese academics' perceptions of PC breaches and its major implications.

METHODOLOGY

The present study adopts a qualitative approach, centred on individuals' personal experiences, their emotions, feelings and behaviours about a specific phenomenon or problem (Snape & Spencer, 2003).

Thus, qualitative research is particularly adequate for this exploratory study that aims to understand the subjective meanings that individuals attribute to changes in the academic employment contract, and the need of further clarification and a deeper understanding of the content and implications of the PC violation. This study uses qualitative research interviews (King, 2004) as the technique for data collection. This will allow us to examine the research topic from the perspective of the interviewee, and to understand how and why he/she come to have a particular view or opinion on the topic (Kvale, 1983, cited in King, 2004).

Sample and Procedures

The study sample comprises six interviews with Portuguese academics. They all belong to the same northern Portuguese university, due to reasons of availability and convenience. Three of them are from business and management field, one from humanities, and two from engineering. We interviewed four men and two women, with ages ranging between 35 and 55 years. In terms of academic position, one interviewee is a full professor for about thirteen years, and the others are assistant professors with four to ten years of work experience in that rank.

The interviews lasted between one and two hours. The conversation focused primarily on the academics' perception of employer fulfilment of the PC contents, and its implications on academic work activities. Each interview was transcribed *verbatim* and then submitted to a thematic content analysis. The themes emerged after a systematic and cumulative comparison between the data in each interview and the iteration process with the literature review (Rubin & Rubin, 1995).

PRELIMINARY RESULTS

When analysing the interviews conducted within this small group of academics, two major themes emerge: one deals with the perceived breached contents of the PC, and the other concerns some major implications that can be derived from it.

Breached PC Contents

This main theme identifies the contents that our interviewees perceived as being breached/violated by their employing organization. There's an obvious emphasis on the increasingly "degrading" working conditions in academia. Some sub-themes emerge here.

The lack of funding for research activities. The interviews flagrantly reveal the worsening working conditions of academics. According to the participants, the core roles and activities of the academics – teaching and research - are suffering the negative impact of financial constraints and diminished administrative support:

> "The University should give us more money. Yes, it should. (…) Our research centre was not given financial support due to political reasons… (…) anyway, in other universities, for example, I hear my colleagues saying that they have [support] for at least a conference per year. We've never had this here. Therefore, all the support I get is mine… (…) It is not the institution but me, (name), knocking on every door trying to get financial support (Female Assistant Professor, 39).
>
> "My perception is that the University does not have sufficient resources to give us. So, we have to create internally our research centers. (…) We are a university that proclaims to be research oriented but does not provide the necessary resources for that, it sure doesn't! There aren't any available resources from the university to do research. (…)There's nothing! We want to buy books… I had to spend money from my own pocket to buy the books that I needed! (Male Assistant Professor, 39)

The excessive burocratisation of academic work activities. All the academics interviewed feel forced to use precious time that should be allocated to teaching and research activities with bureaucratic tasks that exceed the boundaries of academic work:

> "It is absolutely scandalous the work… then, the administrative management of a [research] project that is made… solely by the researcher or the grant holder, or anyone! There's an office… it takes responsibility over small things, such as payments, but… (…) All the financial report is made by the researcher. And the payments, then, a hell of a thing (…) Hilarious!" (Male Assistant Professor, 50)
>
> Faculty, teachers and researchers have progressively being transformed into… shall we say… administrative employees. There is a set of administrative routines, documents, files, etc. that they are supposed to fill… this doesn't make any sense, it gives de impression of an organization that doesn't have an understanding of the role each actor has to play… (Male Full Professor, 55).

The disillusionment with the rhetoric of research excellence. At the same time, and paradoxally, the university claims to be a research university. In this regard, the perception of breach is related to the absence of a cohesive and coherent strategy for the university, and a dissonance between a rhetoric that emphasizes research competitiveness and publication outputs and a lack of financial and human support for achieving that goal:

> "This is… clearly a survival reasoning. I can't see anybody with a strategic thinking concerning this University's future. Some time ago we had a vice-rector that used to say that the University doesn't have resources to allocate to research. Despite that, they [the University authorities] claim that we are a research University. So, I think that those people might be well-intentioned – I believe they are – but they do not make a clue on how to run an organization (Male Assistant Professor, 39).

In fact, most academics strongly believe that the strategy that is being publicized by the University – of research excellence – is undermined by the insufficient work conditions, the teaching overload and the lack of research funding. Thus, the strategy of research excellence is looked with suspicion and disbelief by some of the academics interviewed. In the end, it functions as a marketing strategy tool for external stakeholders, mainly the community – and is seen as an exercise of mere rhetoric:

> Now, they suddenly claim that our goal is research - let's all do research! -, but this won't be easy. I think that what should be done is a question of… improving researchers' conditions, isn't it? People might say that our mission is research, but when it comes to practice… they don't give us conditions… it is something

that seems nice to say, to pass the message externally, but the reality is that no one is really interested, isn't it?"(Male Assistant Professor, 39).

This same academic notes that the pressure to increase research output is forcing some academics to invest less in the quality of the work that is being produced:

"I can see most people working on their PhD's, and hurrying up, and then the thesis come out with a very poor quality and… they just want to achieve the grade, basically they just want the degree and this brings out some problems".

The multi-skilled academic and the schizophrenic career. This PC breach refers to work overload experienced by academics, since they have to perform a set of multiple and diverse tasks. Work overload and academics' inability to respond to those challenges is therefore related to the perception of breach in terms of what should be offered (working conditions) and what they actually receive:

"In terms of research, I would like to be more productive, I'd like to have more time because I'm not a genius. So I need time to focus, I need time to write [papers] and… (…) I would like the University to give me time to prove if I'm capable or not. This semester I'm about to have a nervous breakdown because the teaching load and the pedagogical demands are tremendous, tremendous and, for the sake of the research role, one cannot stop working. (…) Then you have, for example, a paper in the review process and you receive the referee comments and you have to work on it. (…) And you have to… it's a total chaos, a total chaos (Female Assistant Professor, 39).

The work schedule is organized around various roles and a diversity of tasks, and most academics feel pulled in several directions at the same time. A male assistant professor describes this feeling as follows:

"The thing that mostly affects my work, right now, is the multitasking. (…) I mean, you have to build a career based on four pillars: research, teaching, management, and university extension. Such obligation has prompted the individual fragmentation, isn't it? (…) Almost as if a football player having to play every position: offensive, defensive, middle field/centre or quarterback isn't it? (…) With the advent of master courses, the "massification" of master degrees, Bologna and the creation of new courses, the span of subjects increased." (Male Assistant Professor, 50).

The lack of recognition by the academic organization. Our interviewees believe that their contribution to the University is not being adequately rewarded, since the University fails to reciprocate the time, energy and effort devoted to research, teaching and management responsibilities. This is a content perceived as not being fulfilled by many of the interviewees, as the following quote illustrate:

"I have worked sufficiently to get my PhD (laughs). And then, what did the institution [university] do? The institution, right after my PhD conclusion, has burdened me with administrative work. I had to replace every single colleague in senior positions, isn't it? The senior colleagues have exercised their power, in every ways: administrative work, vigilance of exams, everything! (…) I started learning to say "no". In the beginning I used to say "yes" to everything but then… I realized that I was staying behind because the same people that ask me things do not give recognition afterwards" (Female Assistant Professor, 39).

A 50-year-old assistant professor highlights the fact that he's about to become an old assistant professor without being adequately recognized:

"So, I have two research projects, some published papers, I have this and that, but… I'm still an assistant professor! (…) I never thought of myself as being a careerist in the past, but now I realize the importance of being careerist. I started figuring out what the academic career was about, all the inherent injustices and violations. And this hurts much more than… it's not really about climbing the ladder… in fact, it is the lack of recognition".

Unfair treatment and lack of transparency. The interviews echo episodes of perceived injustice. Some academics feel organizational injustice and unfair treatment:
"I think that the majority of conflicts happen because of… the way the institution is managed. (…) All the tactics used, or the possibility of defining criteria that is not truly objective, allows for different treatment. (…) But when you have more objective criteria… this [sense of unfair treatment] decreases. It diminishes this… I think that this might mitigate that perception. For me, this is the main source of conflict. (Male Assistant Professor, 39)"

Another male assistant professor (39 years) recalls episodes of unequal treatment concerning promotions. In his words:

> "Some academics have recently been promoted to associate professor without… with zero publications, scientific publications, isn't it? The only thing he did was… he was the course director for six or ten years, by department's decision (…). He didn´t do anything in teaching as well as in research. The case is now in civil court and let us see what is going to happen then. (…) Indirectly, this [unfair treatment] ends up damaging other colleagues. (…) I'm almost convinced that academic progression is based on friendships. And criteria tend to vary according to… tend to change according to individual preferences. So… career progression is a matter of convenience".

This means that evaluation criteria, even though formally defined, can be manipulated according to specific circumstances. This academic choir of voices also suggests that the exchange of favours is a common practice in the academic realm.

Implications of the Perceived Breached PC contents
This second set of observations addresses the consequences of perceived PC breaches. How do the academics feel when they perceive that the university has failed to fulfil what was perceived as paramount on their employment relationship?
Some of the sub-themes identified here are related to academic professional values (Schein, 1996). But the interviewees also emphasize the increasing demotivation, the intention to leave, the worsening relationships (interpersonal conflicts and competitiveness) and to some extent dysfunctional working climate after the implementation of the major reforms.

Disenchantment and intention to leave. According to Schein (1996), an important career anchor relates to service and dedication to a cause. In this sense, the career concept is structured in order to allow individuals to exert influence over social policies and labour relations within his/her organization. For some participants, the feeling that they no longer contribute to a common project and the loss of a sense of community resulting from dedication to a cause seem to be lost:

> "I have never been solely a faculty, since I have assumed, in terms of the profile… as well as in terms of the subject I teach and research, I have always assumed an active role beyond the boundaries of the university…. I've taken responsibility for the creation and development of a wide range of different projects over the years. And people felt the growth and affirmation of the University as a project they were part of, or something they could contribute to. Nowadays, I think we are experiencing an inverse moment, where people do not find any stimulus to give a personal contribution (Male Full Professor, 55)."

The managerialist discourse emphasizing excellence in the university collides with daily limitations encountered by contemporary academics. For some interviewees, the university cannot be seen as a "common project" and a "community of best practices" anymore. Some academics may leave the University and others have already left:

> "People of my age, or a bit older than me that, for several reasons, met some length of service criteria are gone. I mean, people I've met, with whom I've worked, mostly from my generation have suddenly abandoned the system. And why have they left? Because they do not identify with this climate anymore, they do not fit in… (Male Full Professor, 55)."

This discourse of disenchantment reveals that academics are not motivated and seem willing to leave the university, since their needs and expectations concerning the academic profession are not being fulfilled.

Escalating competition between peers and misbehaviours. Most of the academics interviewed felt that the implementation of a new evaluation system, emphasizing essentially the publication output, has negative consequences for the organizational climate and interpersonal relationships. In this regard, interviewees pinpoint a set of interpersonal conflicts and dysfunctional behaviours, such as the lack of collegiality and collaboration; increased feelings of rivalry between pears; lack of transparency or information disclosure; and finally, instrumental and political behaviours in order to "get ahead":

> I think that the new performance appraisal system is a fashionable issue and the expression of the university's discourse, a general discourse. When I talk to other people around here I can perceive them

unmotivated (…) I'm often confronted with comments, such as: "If I could… if I could I'd go away". (…) One of the most unsatisfying dimensions is the relationship between colleagues. A context of extreme competitiveness has been fostered between peers. (…) Sometimes, and this is because of the moment we're living, a logic of favouritism develops. And then, someone, regardless his own merits, is promoted or has more success due to circumstantial alliances (Male Full Professor, 55).

One male assistant professor (50 years) made the following comment:

"There is no cooperation between colleagues (…) we compete a lot, isn't it? (…) I see that every single person, intentionally or not, probably intentionally, hiding [information]. Why? Because the person feels that, if he/she gives card trumps to the adversary, when a vacancy opens, the arms were given to the competitors."

A male assistant professor (39 years) spoke of the process by which some colleagues are developing some unethical behaviour:

"I have a colleague of mine that… she has no tenure and then… she is almost panicking. As a result, relationships are not very healthy. As a matter of fact, she is now angry with me (smile) because of the responsibility over a course unit. During the time spent in my sabbatical, she was assigned responsibility over that course unit and now doesn't want to give it back to me, because she believes to be in a very fragile situation. She needs curriculum; she needs those things, isn't it?"

Additionally, the unpleasant collegial relationships and the tense organizational climate are originating other negatives consequences. Most of it can be depicted as dysfunctional emotions, such as envy and jealousy.

"(…) by the time I completed my PhD – I was supervised by a person from my department – I was invited to participate in a project outside this University and out of my former supervisor's control, and I think that he wasn't happy with that. For me, this is not a matter of concern anymore, but I believe that my colleagues still point their fingers towards me (Male assistant professor, 39).

A female assistant professor (38 years) puts her finger on one episode illustrative of the unethical behaviour of some peers:

"(…) I shared this PhD supervision with other colleague. After some initial problems with the student (…) she contacted other colleague that immediately accepted to supervise her without consulting the former supervisors… until today, he has never discussed the subject with me because… well, because he is a bit older than me, I'm just an assistant professor. (…) This was a truly dishonest behaviour, since he has accepted to supervise her before discussing the issue with us.(…)"

According to our interviewees' narratives, collegiality and the sense of academic community do not seem to be much disseminated these days. The logic of individualism and fierce competition for scarce resources prevails over academic collaboration and solidarity. The exacerbated competition is constraining the development of healthy collegial relationships between peers. This situation cannot be seen in isolation, since the few vacancies available for tenure positions also contribute to this perception.

CONCLUSIONS

Although there is a considerable literature that deals with PC and its breaches/violation, there is no comparable literature that examines the specific contents of academics' PC.

This preliminary analysis of the impact of the profound alterations in higher education institutions on academics' psychological contract reveals some important findings. On the one hand, the interviews suggest that academics are noticing significant breaches on their PC. On the other hand, some major changes on values, attitudes and behaviours are taking place as a consequence of the reforms. Each of the academics interviewed told us stories relevant to their personal experience within this new educational and professional paradigm.

In sum, this research found that psychological contract breaches were related to: (1) the insufficient working conditions, specifically the lack of financial support, excessive workload, and the obligation to multi-task instead of performing the "real" tasks; (2) the failure in fulfilling the university's mission– that is, research -, and consequently neglecting some core values of the academic profession (professional identity); (3) the lack of recognition and promotion opportunities; and (4) the unfair treatment and lack of transparency.

The main implications of the perceived breaches can be summarized as follows:
(1) disenchantment and intention to leave; and (2) the escalating competition between peers and misbehaviours.

We can note some criticisms concerning the so-called bureaucratization process. Our interviewees argue that it tends to routinize work but does not necessarily improve academic efficiency. They also complain that there is no longer time for research within the reforms.

For those academics, some changes are damaging workplace relationships and destroying some core values of the academe. As a future trend, it is likely that academics under this wave of reforms will be more and more concerned with their individual career than with seeking healthy relationships and efficient departments.

It will be interesting to see how these perceptions of psychological contract breaches evolve over time. Will these breaches be strengthened or decrease? Will these perceptions of breaches result in the perception that PC is being violated?

One may speculate whether academia is prepared to manage such attitudinal and behavioural consequences. The higher education institutions, specifically those in management positions, cannot ignore such implications. Unless there is not a truly concern with bringing about real changes and positive outcomes...

Abstract: Our professional practice in institutions of the training of teachers on Physical Education, has contributed for a bigger attention and concern with inborn questions to the definition of the teaching identity. In order to study these questions, we developed the present study, looking forward to find out about the structure of teachers of Physical Education. We mean to identify if teachers evaluate while, considering the consequence of the initial training in the definition of its teaching identity. Appealing to a methodology of qualitative form, this study has been centered in a group of fifteen teachers with distinct training in the Physical Education area in the most known institutions in Portugal. We conclude that teachers, independently of their school of teaching and their professional experience, define themselves as good teachers, assuring to possess good pedagogical capacities, looking forward to promote the learning's and to develop the capacities of the pupils, being brainstormed to them values and valuing the question of knowing to be.

Keywords: Physical education, teachers, identity, self-esteem.

INTRODUCTION

It was only in the decade of the seventies of the last century that the first studies on critical and interpretative analysis of the History of the Physical Education took place in Portugal. When studying the training and the construction of the identity of teachers of Physical Education in Portugal, we evidence that both have come to suffer throughout the twentieth century, some influences and changes, following the historical evolution, in its social dimension, politics, economical, educative, cultural and scientific.

During the first three decades of the twentieth century, the attempts prepared for an introduction of the training of teachers on Physical Education had appeared separated and without obeying to any systematic plan or consistent ideology (Crespo, 1976). In 1930 the Superior School of Physical Education was only created, in the *Sociedade de Geografia* in Lisbon. Experience acquired in this school consists an important landmark in training of teachers that did not lead to motivate the ones responsible for the launching of an official institution that would come to occur in 1940, with the creation of the National Institute of Physical Education. The creation of this institute consisted a truly significant moment, in terms of training of teachers on Physical Education. The first statute of the *Instituto Nacional de Educação Física* (INEF), elaborated in cooperation regime with the Portuguese Youth (Viana, 2001), confirmed formative and regenerative character of education to grant, having a strong constituent in the area of the medicine, along with another one of military source (Nunes, 1995). The creation of the INEF had as main purpose to form agents of education of disciplines of Physical Education (Oliveira, 1944). However, although legal normative, the difficulties in the training of these agents had stood back due, to the lack of structural investments that answered to the modest installations, the deficient acquirement of materials and the reduced number of teachers formed by the National Institute of Physical Education.

The promotion of sports education in Portugal only happened at the beginning of the Sixties, characterizing this period for an enormous enthusiasm for the physical activities, on behalf of the elaboration of curricular plans of Physical Education and in concerns with the training of teachers. However, as Brás (1996) refers, this concern was not reflective in an effective increase of formed teachers.

At the beginning of the decade of the seventy´s of the last century, we presence a modernization of the educative system, that did not ignore the discipline of Physical Education (Rosário, 1996). In this period only one superior course, not university, of training of teachers existed in function, at the National Institute of Physical Education, and two regular courses of instructors, given in the Schools of Physical Education of Lisbon and Porto.

In the sequence of the political events of the 25th April of 1974 and the change of regimen, the intention of the democratization of the society generated alterations in the structure of the educative system. The National Institute of Physical Education was extinct, having, also been abolished the Instructors Schools of Physical Education. On the contrary the Superior Institutes of Physical Education in Lisbon and the one in Porto, the first one integrated the Technical University of Lisbon, as in the University of Porto. But, although the creation of these institutes, Nunes (1995) refers that it is not easy to say that there was "training of teachers" of Physical Education at that time. In fact, in the period understood between 1975 and 1984, the courses sinned for uncertainty in the formularization of the objectives, which compromised the training of the teachers. The recognition of this ambiguity contributed, at short-term, for the reorganizations of the courses in the decade of the eighty's.

One other decisive landmark in the training of teachers of Physical Education, in Portugal, had begun in the end of the decade of the eighty`s, with the redefinition of the ISEF´s in courses, with the ISEF of Lisbon to be College of Human Motricity integrating the Technical University of Lisbon and the ISEF in Porto, being named College of Sciences of Sport and Physical Education. From the nineties of the past century, we assisted to an explosion of teaching institutions that offered the initial training of professionals in Physical Education. This growth of offers, this proliferation of heterogeneous and diversified courses, and the multiplication of courses in the state sector and the private domain, on the other hand, it became evident the recognition of the importance of this area, this gave origin to the division and the disorientation in conceptual and methodological terms and the training of professionals with different conceptions, models, abilities and representations, which in a certain form, has contributed for a certain "spilling" of the identity of this professional group.

Facing this scene, the investigation on a professional identity of the teacher of Physical Education is figured as a complicated task. To study the teaching profession and its professional identity implies the recognition of the diversity that characterizes this professional group. As Nóvoa (1992) relates, to feel like a teacher or to assume themselves as teachers, is the result of a progressive process, constructed day by day and throughout the years, since the moment of the option for the teaching profession. The identity is not an acquired data, it isn´t a property, but it is a place of fights and conflicts, it is a construction in ways to be and to exist in the profession.

Therefore, since the individual differences until the group differences or affinities that distinguish, approach or oppose individuals in relation to the others in the breast of the same profession, it is possible to find a great diversity of variables that support this heterogeneity or homogeneity. Among others changeable, we considered as determinative the passage of training of the teacher of Physical Education. This variable seems to us, to be of a special importance related to heterogeneity /homogeneity, because the fact that their exists, currently, a proliferation of institutions of initial training in the domain of the Physical Education, ones with more prestige of what others, and with a faculty with very distinct qualifications, as much in the public sector as in the private one, concurs, in our opinion, for the emergency of identities that admit ambiguities. It was on the basis of these predictable, that we looked forward to develop a study that analyzed the way that teachers of Physical Education if they evaluate while teachers of this area, studying the consequence of its initial training in the definition of its teaching identity.

METHODOLOGY

In this study we basically, intend, and as already referenced, to analyze as a group of teachers of Physical Education of basic schools (of 7th, 8th and 9th years of schooling) and secondary (of 10th 11th and 12thyears of schooling) Portuguese evaluate themselves, attending to their different initial training and the diversity of experiences that they had lived deeply. The nature of this investigation took us to consider it pertinent a qualitative study, where the direct speech submits to a interpretative logic, that, when fitting and explaining the position of the interviewed teachers, it intends to give account as the teachers of Physical Education evaluate themselves in the current Portuguese school context. Pointing out to us, therefore, in a frame of a not positive and interpretative paradigm of phenomenological and ideographical nature (Cohen & Manion, 1990) we appeal, in this inquiry, to a methodology of qualitative care that puts the tonic in the revalorization of the "person", as subject of knowledge capable to reflect, to rationalize, to communicate and to interact (Pujadas Munoz, 1992). However, it is of our interest to interpret more the perceptions of the teachers of Physical Education to return an analysis that can be a new reflection for the teachers of this area.

It was our intention, to motivate the emergency of referring data to this study, we appealed to the use of a semi directive interview, also assigned of clinic or structuralized and to analyze the data scheduled from this inquiry for interview we appealed to a technique of inquiry, capable to codify the half-free and apparently

disordered declarations: the analysis of content (Holsti, 1969; Berelson, 1971; Bardin, 1977; Krippendorf, 1980; Ferrarotti, 1986; Vala, 1986).

Our sample was constituted by a group of fifteen teachers (Figure 1) with distinct initial training of the approved area to the discipline of Physical Education in the institutions well known of our country during the twentieth century: the *National Institute of Physical Education,* created in 1940; the *School of Instructors of Physical Education of Porto and Lisbon*; the *Superior Institute of Physical Education* of Lisbon and Porto; and the *Faculties of Sciences, Sport and Physical Education,* created from the beginning of years 90.

E2, E13, E14	Instituto Nacional de Educação Física (INEF)
E10, E12	Escola Instrutores de Educação Física (EIEF)
E1, E4, E7, E8, E10, E11	Instituto Superior de Educação Física (ISEF)
E3, E5, E6, E9, E15	Faculdades de Desporto e Educação Física (FAC)

Figure 1: Codes of Interview and Institutions of Initial Training

After our decision to study this group of professionals, we proceeded to make a selection not in a arbitrary form and without looking for a objective "representation" of qualitative data character of the methodology. This selection was looking for a guarantee that the biggest possible diversity of experiences and personal characteristics was made on the basis of the passages of initial training (training institutions).

With this procedure we intended that our sample was constituted by teachers who had different training in distinct historical periods, with service time and position in the career differentiated in the direction of approaching them to the concept of sample of the maximum variation.

ANALYSIS

In a society where changes occupies a central place, the understanding of the teaching professional identity has to consider, necessarily, the teacher exercising in professional and formative environment, that is, it has to be considered the existence of an identity that is created in such a way in a theater of the work, as in a stage of the training (initial or continuous). Therefore, in the analysis of the professional identities of these teachers, we always looked forward to consider, the forms to be, not only in the profession and before the profession, but also to analyze the stages of its initial training and the modalities of training that had determined its form to be before its profession, because in accordance with Dubar (1997) the choice of a type of training normally leads to a process of legitimating of an identity form. With intention to understand the form as it is that the teachers of Physical Education of the different schools of training and acuity, we proceed, therefore, to the analysis of the form that teachers evaluate while teachers. Simultaneously we looked for terms to compare the registers of the teachers with different training, with intention to try to make out, if this construction of the representational dimension of the identity is related, in some way, with the initial training got, or the representations of this training.

Still before passing to the analysis of the results, we think that it is necessary to make reference to some aspects that we consider important. In first place, saying that the study that we present here was carried through in the scale of an inquiry including more than if leaned over on the identification question, not only in its representational referring dimension of self-esteem, but also in the different dimensions and categories that compose it. In second place, to relate that the analysis of the emergent data obeyed logic of functioning based on the vacillation of two phases. In a first phase a vertical analysis of each one of the interviews of the teachers formed in different schools was carried through and in a second phase we proceeded to a horizontal or comparative analysis with resource to the method of the "constant comparative analysis" (Miles and Huberman, 1994) with intention to identify common and distinctive aspects of the representations and perceptions of these teachers. For the effect we will present the information proceeding from the interviews, also, in frames, with the objective to give examples that relevance of some of their opinions. We think that the choice of this organized model of information, allows us to study the representations of the teachers on a systematic and analytical form, allowing a more adequate visualization of the representative general frame of its conceptions. And in third place, to say that the referring units of register to this dimension of the identity, by its character evaluative, had been signaled with the expressions of Full Approval (+), Full Reprove (-) and Reflection (+/ -).

Thus, relatively to the representations of the teachers formed for the INEF, we find in this area nine registers that distribute in a equitable form for the classifications of Full Approval and Reflection. While the first one designates four registers, the second designates five. One observation, however, the registers of Full Approval is related to teachers - E2-, who evaluates himself as a good teacher. The others five are distributed

to the other two teachers of the INEF, although the work developed in *the Liceu Nacional de Chaves* secondary school throughout more than thirty years, they evaluate themselves as reasonable teachers. But knowing that they always had fought for the affirmation of the teachers and of the discipline of Physical Education, it seems to us that this position does not correspond effectively to the value that they possess, assuming all the modesty of these professionals who want more and better for the area that they work.

T	RU	Signal	Register
E2	2	+	Yes, yes! In this aspect, due to the numbers I received when I was in the formation I consider myself as a 100 percent teacher.
E13	33	+/ -	I am a reasonable teacher. In a general form I am what I thought I would be.
E14	35	+/-	I am a reasonable teacher, I consider myself a median teacher, but I have always been a good professional that rarely miss classes.

Figure 2: National Institute of Physical Education

With effect, the teacher - E2- consider, as we can read above in the first unit of inventory in the frame, that the "one hundred percent" was always a teacher and little more could have made for the affirmation of disciplines of Physical Education in *Trás –os Montes*, northeast region of Portugal. Affirming themselves as the first teacher of Physical Education in *Macedo de Cavaleiros* looking for, not only a mark time in this region in the area of the Physical Education, but also in the sports area, foments a component more competitive. Thus, and in parallel, to the teaching of Physical Education, that was made without any gymnasium it established "(…) *two clubs, o Atlético, one, with intention to provide to whom they were not my pupils and that didn´t have form to practice sport of making* (...)" (RU 3). In turn, the teacher - E13- assuming a more humble position considers to be, as we can read in the second unit of register, a reasonable teacher who reached what she thought to come to be as teacher. Leaving the estimated one, that for most important itself always was the educative dimension, in detriment of the sportive one; she thinks she has fulfilled to her essay with effectiveness and common-sense. Teacher - E14- in the same line of thought also considers being a reasonable and medium teacher, underlining that most important for him was: *"(...) to always educate for the life and with much balance* "(RU 37). When assuming himself as a reasonable teacher, they disclose more the requirement of its appreciation and humble facing its contribution. Truly, they had always looked forward to be good teachers and to dignify the profession.

But there are teachers to whom time demonstrated that not always they had obtained to fulfill what they had desired. It stops beyond these teachers of the INEF, we also interviewed teachers of the Schools of institutionalized Instructors of Physical Education in 1969. The creation of these schools was amply contested by many professionals, because it was understood that its main objective was to form agents of education quickly, with less qualified that would fill in the gap of lack of teachers. However, it was demanded that the instructors of Physical Education who reached the same objective of education and that they exerted the same pedagogical responsibilities that to the ones formed by the INEF, that situation came to glow the polemic between the teachers and the instructors, therefore the difference of decree came to reflect negatively in the ground of the realistic professional, raising a barrier between the professional classroom (Crespo, 1976). It was for this reason that we considered important to, also, interview teachers/instructors, with the objective of trying to understand the way they have lived this situation of correct inequality and evaluate themselves while teachers of this discipline.

T	RU	Signal	Register
E12	31	+ / -	I think I am a reasonable teacher. I have always tried to be a good professional and nowadays I am close to what I thought I could be one day.

Figure 3: School of Instructors of Physical Education

The instructor teacher in the EIEF, - E12-, that taught during all her life in the same school that the two teachers of the behind cited INEF, seeming "to drink in the same source", also evaluated themselves, as we can read in the list unit of frame 3, as a reasonable teacher strengthening herself always for being a good professional, coming currently close, to be what she thought she would be as a teacher. Furthermore, she

equally places the importance in the of the young training with whom she has responsibility daily. According to it: "*I am worried in infusing values to them and attitudes and more than all I look for that they recognize the importance to adopt styles and healthful habits of life. I think that it is above all in this area that the Physical Education can and must act…*" (RU 32). In precision it finishes by expressing its condition of educator and there she understands that there is still a lot to do.

In concerning to the representations of the teachers formed by the *Institutos Superiores de Educação Física* of Porto and Lisbon, we have in this area thirteen registers that relatively reflect the opinion of these on evaluation while teachers. All these registers, to the exception of two of the teachers, - E8- and - E13-, that evaluated to a medium level, are registers that they relate an evaluation with one strong positive trend, evaluating as, or good or very good teachers still detaching some of their edge of progression.

As we can observe in frame 4, in the second unit of register, the teacher - E4- thinks that it is each better and it feels that the maturity and the evolution, while professional, can still make of it a more competent professional. However, as it underlines it is necessary that they provide the adequate conditions so that this happens. He says*: "I know that I can still improve and I can have a better compensation while teacher, but necessary if the institution that collaborates and supports the Physical Education. I cannot evolve if I have a school more bureaucratic each time and that doesn´t let me to work in some areas that I find important (…)*" (RU 10).

T	RU	Signal	Register
E1	1	+	Yes… I suppose sometimes I am to humble because I think effectively that I am a good teacher, thus the skills of my students demonstrate that.
E4	9	+	I think that I am getting better. Getting always better, because my maturity and my evolution along my life has made me think in a different way. But I am conscientious, that I can produce more and better if I want to and if they would let me.
E7	17	+	I always thought on being a good and very good professional. Very hard working not only transmitting my acknowledgements but also with my relationship with my students.
E8	20	+/ -	I consider myself a perfectly normal teacher, I am nothing extraordinary.
E10	26	+	My professional course throughout these thirty years and the public recognition make me believe that I am a good professional.
E11	11	+/-	I think I am a reasonable teacher and I approach what I thought on becoming. Although I have one thing less positive, my age It doesn't permit that I do certain exercises that I did with my students some years ago without difficulty. That leaves me a little bit sad.

Figure 4: Superior Institute of Physical Education

Here the disappointment on recent evolution of the organization of the schools in Portugal is transparent. At the beginning of its initial training, he wasn´t prepared for the bureaucratic requests of the teaching profession. Further on, he understands that it is not to fulfill its true function, that one for which was formed. The fourth unit of register of the same frame, discloses a teacher with a very similar position to the teachers of the INEF, assuming themselves as perfectly reasonable teachers, but, as they affirm, "*(...) responsible and pledged in what I make*". It obtained "*to be the teacher who thought to come to be*". For this teacher, "*is to bet in the relation with the pupils. It is with them that we pass great part of the time and they are object of our training, therefore the reflationary question is basic…*" (RU 20). This teacher, clearly, assumed that it is its condition as educator that more interests to him and in which he wants to invest. It's in this source that he feels at ease. Teachers-E1, - E7- and - E10- evaluating itself also as good teacher, with good pedagogical capacities line up for the speech of the teacher - E4-. The first one relates that, at the time being, he´s too humble, but finishes recognizing that he´s a good teacher. This perception is supported, also, by the feedback that he has received from its pupils, have praised who frequency puts it in words, "*(...) me of the one supplemental motivation*" (RU 1). In turn, as it not only enhances that she is a very pledged professional, in the transmission of knowledge, but also in the relation with the pupils, coming close, currently, of the professional who she thought would become. Effectively most important for this teacher "*(...) is the form to deal with the small ones, with the young*". Its words are well expressive: "*I notice that the relation that we have with them is a relation each time near subsequently and this situation makes me think that, the social and affective point of view, our young students require more concern. And it is, also, in this area that the teacher of Physical Education has an important paper*" (RU 19). It is the case of one other teacher - E10- who raises the fact of its professional passage, during about thirty years, having had public recognition he

thinks that he has been a good professional. As he has received a very positive feedback, also on the part of the pupils, he considers that it has played very well its role while teacher and this leaves him very satisfied. Later on, and as the teacher - E2-, his functions during these last thirty years in *Bragança* has not been summarized only to the teaching. He says: *"(...) I already was chairman of the board of arbitration of soccer of the zone, I was regional technician of the Association of Bragança during twenty two years and was gymnastics trainer during sixteen years and I always tried to fulfill with the inherent obligations to the positions"* (RU 28). As it is evident this teacher recognizes its effectiveness stops beyond the school. It feels somebody important. Finally the teacher - E11-, with an identical perspective to the one of the teacher- E8, underlines that a reasonable teacher considers itself, coming close, of what she thought to come to be. Coming very close to the form of the Physical Education of the teacher of the INEF - E13-, she ends, relating that *"what is more important for me, while teacher of Physical Education, has been the transmission of values, the promotion of habits and healthful styles of life, the defense of a physical education for the health and not only for the competition. This has been most important for me"* (RU 30). But also it is visible here that the heaviness of the years to reconsider its performance. She already cannot evidence for the physical capacity. On the other hand, the experience says that most important is in the integral formation of the pupils. More than to form athletes is to feel better prepared to educate for the health, her physic welfare. With respect to the representations of the teachers formed for the most recent schools of Physical Education, we have in this area fifteen registers that relatively reflect the opinion of these teachers to its evaluation while teachers. All these registers of Full Approval disclose that the teachers possess self confidence relatively sufficiently high to its pedagogical capacities. These teachers evaluate themselves in its majority, as being good, responsible and with a considerable margin of progression.

As we can observe in frame 5, in the first unit of the exemplificative register, the teacher -E3- considers that he is a good teacher with an edge of accented progression. Although he relates, that *"I look forward to be a teacher who worries about the interests of the children and looking forward to be their friend, without obviously leaving to fulfill to the contents program (...)* "(RU 6).

Already the second unit of register of the frame discloses a teacher who assumes he is responsible and that he tries to infuse values in the young children, considering more important the acquisition of values as the responsibility that the execution of one determined exercise. In this direction, it affirms that: *"(...) when I see that a small one doesn´t know how to do, I give a great emphasis knowing how to be, because for me this is very important. The small one cannot know how to do, but the fact of strengthening and looking for, how to go until he limits its capacities are very important. They might not know, but the interest and the effort for me are something that I must value."* (RU 12).

T	UR	Signal	Register
E3	7	+	In general terms I think can consider being a good teacher, because I consider that I am good on what I do.
E5	11	+	I am a responsible teacher. I try to introduce a question of values in the students. For me they may not be able to do the flip-flap but they must be responsible, punctual, and have to know how to be.
E6	14	+	I consider myself a good teacher and I try to be always responsible.
E9	22	+	I think that I am a good teacher and I try to be a good professional, although lately it has been difficult because I do a lot of km every day to get to school.
E15	38	+	I consider myself a good professional, but badly paid and I think that today I am a better professional than I ever thought I would be.

Figure 5: Faculties of Sciences, Sport and Physical Education

The teachers - E6-, - E9- and - E15- assumed, also, as good teachers, but they do not leave to disclose different aspects. The first one, the prolongation in this question does not put the tonic in the question of the responsibility and the importance to establish an adjusted relation with the pupils. The second teacher affirming, equally, as a good professional, considers that still, she has a very small border of progression and that therefore, can improve its performance sufficiently. However, something makes her apprehensive, with this performance, because it feels that, the, three hundred km that she covers daily to dislocate until a school, can affect these proceeds. As she relates: *"the disposal not always is best and the pupils do not have any fault"* (RU 22). As the previous teacher, she adds that most important for herself *(...)* *"is the relation with the pupils. To learn namely to be with the pupils, to learn when I must be more demanding and rigorous or more permissive those are some of the challenges in this life of teacher.... As if it must interline or approach definitive situations... Are this that are affectionate...."* (RU 25).

Finally, the third teacher, also weaved many considerations to this respect, does not consider equally a good teacher, until being better than what really he thought he would be. One more time the pedagogical concern is seen in this teacher, putting the tonic in the relation with the pupils and its education, while future citizens. However, the two last teachers do not leave to mention two aspects that can harm its performance. The last one - E15- says that he considers he is badly paid, therefore that defaulter cannot feel well to invest in its activity. The teacher - E9- of the same account, says that her performance later may be harmed because of the distance between her house and the school.

CONCLUSION

From the analysis carried throughout the interviews, and synthetically presented in the previous pages, we will be able to verify that it has some aspects that congregate more consensuses or more attention of what others. One of the aspects more consensual is detained with the fact, of the majority of the teachers, independently of the school of training and the professional experience; define as good professionals, having a good image of themselves and of the profession. However, and although this consensus, we notice some differences in the appreciations, since the teachers of the INEF and the EIEF, that is, oldest and with more professional experience, relating that they had always played with enormous professionalism their functions, they only evaluate themselves as reasonable teachers, showing, therefore, some humbleness.

On the other hand, new teachers relating for times soundless to possess progression edging, they have few doubts in affirming to be good responsible teachers. Everything is inferred as if they are more careful, indicating that the time allowed in the distance to see between the possibilities and the difficulties, and others are more confident, wanting to valid their abilities, because its generation perhaps already found another interest for the area, believing that they are enough to affirm themselves and to be recognized as being absolutely necessary in the formation of youngest. In any way, most of these teachers, understand that to possess good pedagogical capacities, allowed them to develop the capacities of their pupils of an adequate form. These, allied abilities to the promotion of the development and the learning of the pupils and to the characteristics of the personality of the teachers and its attitudes are, in the reality, an accordance with Costa (1990) and Carreiro da Costa (1994), the main characteristics associates to the concept of a good teacher. The results of the inquiry of Carreiro da Costa (1994), is carried through on the expectations of the professional exercise with students of Physical Education, disclose that their characteristics are more evidenced by the students that have pedagogical capacity, the personality characteristics, the attitudes and the promotion of the learning's and the development of the capacities of the pupils. Looking at the results of this study with the ones of our inquiry, we see that they come into sight in the same direction, since the teachers who we interviewed stop beyond detaching its pedagogical capacities, they, almost always place the tonic in the relation that they establish with the pupils looking forward to promote the learning's and the development of its capacities. In the generality of the declarations it is established great concern with the pedagogical relation and the lack and particularities of the pupils. As in the study of Nunes (1994), they assumed, almost always, as worried educators and in looking at the global formation of its pupils.

We can, therefore, conclude, that, even so, the diversity of orientations and conceptions of the Physical Education, in consequence, as much as the teachers formed in the INEF and the ISEF's how much of the growth of schools of training of teachers of Physical Education in Portugal, during the decade of the nineties of the past century, can have concurred for different perceptions on the form as the suitable teachers may evaluate themselves, they do not seem to express deep and too much harmful cleavages for the affirmation of the identity of the professional group. On the other hand, different perceptions also seem to result of teachers passing from schools of different regions of the country, schools with its human beings particular characteristics, social and physical, that have reflected in the forms to be and the performance of these teachers, as well as the different years of professional experience, that they had finished, inevitably, for defining different ways of understanding the teachers intervention in Physical Education in the perception of school scope.

This differentiation of perceptions and professional profiles has created, in our opinion, a differentiated form of intervention that, here and there, has given origin to small conflicts and protagonist that have made it difficult an affirmation of a homogenate pedagogical culture and a bigger proof next to the pupils and the educative community, in general, on what it is intended with the Physical Education in the schools. Before this situation that harms the affirmation of the consistency of the actuation of the teachers of Physical Education next to the teachers of other specialties, we think that it is necessary to reflect on such differences and to promote initiatives that strengthen the conscience of what is in cause and what can contribute to confer greater coherence to the share, being certain that this pass for equating the components of the training, either this scientific, pedagogical or technique. In any way of our study, it results clearly that self-esteem of

the interviewed teachers is sufficiently good and that they are felt capable to provide an education that raises the physical capacity of their pupils, as well as the understanding of the speed and sport activities. In general, the appreciation that makes of its performances alone is harmed by related external factors with the organization of the educative system. In agreement, with the interviewed teachers, independently, of its antiquity and its initial training, it is not for them that the pertaining to school Physical Education will leave carrying through with the demandable quality. They know what they want and what to do.

Abstract: The research seeks to show contributions to the student teachers professional development, students of a Bachelor's Degree in a virtual course. The research starts to the point of the interaction among instructors from the school and the university, during the pre-service stage of Basic Education Teaching. It is believed that the training period in the initial Teacher Education is a time ripe for significant occupational changes, involving the identity of the transition from student to teacher's identity, enabling the development of an action experienced, reflective and critical. To achieve the goal of this research, which is descriptive and analytical and seeks to understand the contributions of the narratives in the training process. The attitude of sharing experiences, study materials and teaching, as well as the registration of such situations by those involved favored the strengthening of the group, creativity and solutions to the problems faced.

Keywords: supervised training program, teacher professional development, narratives, basic education

INTRODUCTION

In 2007, the Distance Education was established at the Federal University of São Carlos (UFSCar), in order to achieve a differentiated consumer demand, as regards the timing and formation of special interests, seeking to democratize the higher education in Brazil. Through the Brazilian Open University system (UAB[43]), UFSCar offers five undergraduate programs by way of Distance Education (EaD): Music Education, Environmental Engineering, Education, Information Systems and Technology Sugarcane. The admission of students occurs through vestibular public competition. This paper focuses on the Bachelor's Degree in Pedagogia (LPe-UAB-UFSCar), specifically the subject Supervised Pre-Service Stage on First Years of Basic Education and the role of teachers in partner schools, which receive the trainees in their classrooms. The supervised training, a compulsory element in the training of future teachers in the course of LPe-UAB-UFSCar was organized from a different proposal that aims to build partnerships between universities and schools receiving students from a perspective of collaborative work between institutions and teachers in taking action in the classroom as partners and co-responsible for training professional licensing. It is organized around the following assumptions: the School of Stage constitution as a body that acts as co-trainer of future teachers; space of possibilities for realization of the theory-practice; space acquisition of specific learning and teaching activities professional experiences favoring the moment of praxis as constant individual and collective reflection (Oliveira et al., 2010).

In order to study the design of the Distance Teacher Training, this research aims to analyze the characteristics of the curricular and methodological subjects of the Supervised Pre-Service Stage, the results of participation and the performance of pre-service teachers, the virtual tutor, the public school conductor teacher/tutor and the teacher responsible for the Supervised Training Program. The development of the subject depends on the participation of several professionals: audiovisual team (responsible for activities such as web conferencing, video lesson and animation in virtual learning environment - AVA), the instructional designer (responsible for organizing the virtual learning environment), and coordination of training and classroom tutor (linking between the University, centers and public schools). The virtual tutor is

---

[43] The Brazilian Open University is an integrated system of public universities that offer courses for upper level of the population who have limited access to university education through the use of the methodology of distance education. It aims to link existing public institutions, making it possible to take higher education quality to municipalities that do not have higher education courses or courses offered which are not sufficient to serve all citizens.

a teacher undergraduate in Pedagogy with at least a Master's degree in Education and with teaching experience in the early grades of elementary school. The virtual tutor plays a role in AVA with the students, linking content, activities, learning, performance and interaction among the group of students under the supervision of the teacher responsible for planning, developing materials and activities and monitoring of the subject. The tasks of a virtual tutor are to evaluate, correct activities and events, send feedback, encourage students to participate in discussion, forums, group or individual activities, refer questions and problems inherent in the planning subject, as extensions of time, nature of activities etc. for the responsible teacher for Teaching Training.

The classroom tutor makes the linking, at the supporting pole face, among students and training schools, performs individual guidance on the administrative aspects of the school functional, mediating interactions with the school teaching staff.

The conductor teacher/tutor, responsible for an early grade class of elementary school that receives the trainee, has the function of planning and directing the training moments at school in collaboration with the student teacher. Moreover, the conductor teacher/tutor communicates with tutorial staff, mediates the interaction among the class and evaluates the process of participation and performance. This professional attends extension courses offered by the Teachers' Portal UFSCar which prepare him/her to receive the trainees (http://www.portaldosprofessores.ufscar.br).

The conductor teacher/tutor attends a continuing education program, in the distance, aiming to invest in your professional development and hence assist in training for future teachers by making them experience the daily experiences of the classroom and school. The program, organized in two consecutive modules and lasting 120 hours, has as main characteristics a deeper understanding of the context of professional experience and training of future teachers, involving both theoretical content as other practical closely related to the roles of tutor conductor, apart from those related to distance education, internet usage and the AVA. This process involves tracking a teacher responsible for the training program for mentors five mentors and regents, responsibility for mediation in the AVA.

Within this organized structure, the teacher responsible for the subject of the Supervised Stage is in charge of overall planning and monitoring of students and virtual tutors and the training coordination is in charge of the conductor teacher/tutor training.

Besides the Supervised Pre-Service Stage on First Years of Basic Education, the project of training course in Bachelor of Distance Education encompasses other stages like: Early Childhood Education, School Management and Education of Youths and Adults. We can say that the subject of the First Years aims at the construction of a professional identity as well as awakening the pre-service teachers for their knowledge of educational contexts of Elementary Schools and Public Policy Education. That subject makes the students able to analyze their experience in Supervised Training, and actual situations of their training, verifying the link between theory and practice. In this perspective, it is possible the study of transformative praxis, linking the theory and practice. It is expected the work with documents produced by the conductor teacher/tutor as lesson diaries, letters, notes and planning activities, becoming key instruments for the initial and ongoing training, analysis and intervention in the processes of formation.

The development of the study is based on analysis of official documents (Brazil, 2006; University of São Carlos, 2010), researches in the field of Distance Education (Marcelo Garcia, 1999; Moran, 2003, Reali et al., 2008; Rinaldi, 2006) and training practices, occurring in the virtual learning environment (AVA-Moodle) of the discipline Supervised Pre-Service Stage and in the Training Program for teachers of public schools that receives the trainees.

The beginning of any professional activity has its own peculiarities and teaching does not differ that. It is known that various experiments and investigations have shown the importance of support, monitor and guide those who are starting a career in teaching. However, monitoring of a more experienced professional can be characterized as a successful alternative in the training of teachers for Basic Education. Thus, this research seeks contributions to the professional development of teachers, to the virtual students of a Bachelor's Degree in Education from the interaction among instructors from the school and the university, during the training at the school of Basic Education.

We consider that context as a field of teachers training, in which different situations of teaching practice, challenges and dilemmas present themselves to the trainee, the pre-service teacher. We believe that the training period in the initial training is a ripe time for significant occupational changes, involving the transition from student's identity to teacher's identity, enabling the development of an action experienced, reflective and critical and therefore must be planned systematically addressing the needs and / or requirements of the contexts of professional practice. To achieve the goal of this research, which presents a descriptive and analytical feature, and seeks to understand the contributions of the narratives in the training

process, according to Clandinin and Connelly studies (2000), Dominicé (1988), Goodson (1992, 1994) and Nóvoa (1988, 1992), we used the teachers narratives as tools for data collection. The written narratives, referring to experiences on training, show results, which consist of a narration, history, theories and questions that will compose our experience, from which we hope to better understand the different processes that are contributing to a different Virtual Teachers Training.

Throughout the course, we insert discuss issues with the purpose of the training process: Do the school contents present difficulties inherent to the teaching and learning by students of First Years? Are there any particular difficulties in acquisition of school contents? This way, how do you, as a prospective teacher, stand? These questions allow, for example, collective discussion on the teaching of the school contents?

PROPOSED CURRICULUM AND METHODOLOGY OF SUPERVISED PRE-SERVICE STAGE

Three basic points underlying the organization of the subject of Supervised Pre-Service Stage on First Years of Basic Education: a) Constitution of the School Training as a place of teachers co-training b) possibility of implementation of the theory and practice, c) acquisition of specific learning action and professional experiences.

The course syllabus includes discussion of the subject previously read texts on topics relevant to teaching in the First Years, guidelines for participation in school life and guidelines for writing the final report. The aim is also that the trainees are able to conducting class situations, planning, developing and assessing lessons in various components in collaboration with conductor teacher/tutor. The activities performed at school by students of LPe-UAB-UFSCar course must be analyzed based on literature study and received guidance in lectures, writing the final report, which characterizes the accomplishment of subject.

The goal is enabling future teachers to deal with everyday situations of the First Years of Elementary School as planning, developing and evaluating lessons in various curricular components, examining this process, regarding the theoretical foundation, seen during the course.

During the implementation of the activities of the Supervised Training, students have the opportunity to systematize various dimensions (political, educational, personal, bureaucratic, etc.), observed in the school field.

The organization of Supervised Training allows the relationship with the guiding principles of the Course of Pedagogia UAB/UFSCar: 1. diversity, 2. autonomy, 3. research, 4. link between theory and practice, 5. cooperative work, 6. dialogical, 7. construction and 8. reconstruction of knowledge. The guiding principle of diversity that considers the student to experience life and situations provided by supervised training have the opportunity to verify the theoretical and methodological approaches adopted by the teacher and knowledge (school and non school) can be covered and constructed so diversified. It is important that students perceive and think about the different approaches and policy positions in educational activities, to understand that knowledge working in schools is not neutral. Recognize the presence of diversity in the educational act is essential, considering the different ways to build awareness and recognition of multiculturalism in the face of ethnic and cultural diversities of the country.

The question of autonomy is present, because the curriculum course is committed to providing, in particular, possibilities of life and live daily at school, encouraging them to reflect and to position itself, autonomously, in this field complex and multifaceted (Contreras, 2002; Freire, 2003).

From the moment of insertion into the school, the student is driven to be guided by an investigative conduct, aimed at understanding the profile of schools in their areas: administrative, educational, material and human resources, relationship with the community, the main problems children's learning of the group stage, activities / projects undertaken, etc. Moreover, throughout the different experiences and learning provided by Pre-Service Stage, it is expected that the student is able to establish relationships between the knowledge acquired in the course and practice of these within the school, implementing the theory and practice.

Cooperative work is presented as another important guiding principle of Pedagogy courses. The interaction of the trainee with Team School allows the construction of a healthy and cooperative relationship in order to perform actions partners. For this it is essential that practices are fruits of the guidelines and mutual help between the pedagogical coordination, direction, and classroom teacher. The attitude of sharing experiences, study materials and teaching promotes the strengthening of the group, creativity and solutions to the problems faced.

The dialogue, as advocated by Freire (2007), and their different ways of realization is one of the strongest brands of Distance Education at UFSCar. His practice is the assurance and guarantee the work performed. In this sense, considering the complexity of the Supervised Training, the exercise of dialogue is critical to the

success and learning from all segments, manifested by the involvement of institutions, professionals, students (Higher Education and Basic Education) and theoretical knowledge and practical.

Give priority to dialogue in the teaching and learning is the best way to establish interactions among others and avoid acting individually and teach by rote.

In order to train the teacher to avoid the reproduction of knowledge, and act uncritically, the Supervised Training provides the student experience at school and experiencing different situations and relationships on practice of action-reflection-action (Mizukami et al., 2002) and, consequently, for the construction and reconstruction of knowledge in its various dimensions: scientific, educational, common sense, professional and personal. Thus, the training project proposed for supervised training in the First Years of Elementary School reaches the guiding principle of construction and reconstruction of knowledge. In this pedagogical practice that is a challenge that should appear, from the first insertion in practice, to accompany the whole process of training and professional development of teachers.

In this perspective, it emphasizes the importance of Supervised Training that is committed to five areas of work: 1. Insertion experience in the context of professional practice; 2. Having experiences in a reflective, examining the context of the school, involving planning, development of pedagogical actions, continuous assessment and reflection; 3. Using theoretical and reframe; 4. Experience the educational practice as collective process and not just individual; 5. Exercising the investigative approach.

Supervised Training presents itself as a decisive moment for the professional setting of pre-service teachers, they will have the opportunity to achieve insertion experience in the context of professional practice, gain experience reflectively, to analyze the context of school (planning, development of pedagogical actions, ongoing evaluation and reflection), using theoretical and reframe, to experience the educational practice as collective process and not just individual and exercise the investigative approach.

The Supervised Training is structured into three parts. The first includes discussion on the guidelines regarding the integration in school, setting the behaviors and attitudes. Refer to the actions necessary to ensure that the training is in fact training for future teachers and also beneficial to the school that receives it, its teachers and students. In addition, guidance on the preparation of planning activities and the reflective diaries, research focus of their communication, are part of this moment.

The second moment is the inclusion in school. In this context, trainees are instructed and accompanied by a virtual tutor and a conductor teacher/tutor of the training class. In the third step, the student prepares the final report, with the systematization of experience. All questions for the construction of the report should be clarified by the virtual tutor, the teacher responsible for subject and for the whole team.

PROFESSIONAL DEVELOPMENT OF PRE-SERVICE TEACHERS

For the professional student of the Bachelor's Degree in Pedagogy in Distance Education and to the evaluation process of Supervised Training in the First Years, we use written productions of different kinds: - Narrative writing (diary and forum) - Planning activities - Final Report.

Aiming to characterize the process of teacher professional development, we opted for the use of written narratives (Reflective Diary) as a resource for monitoring and intervention in the activities proposed and developed by trainees during the practical training. The records allow the understanding and characterization of the formation process and intervention, articulating the experiences in school and other activities in the subject.

We therefore believe that stimulate thinking through writing reflective diary of virtual dialogue with tutors and colleagues bring contributions to professional development, as indicated by academic studies on the subject. This does not happen randomly, but linked to the possibilities of intervention by trainers in order to contribute to individual and collective reflection in the process of initial teacher training as well as the learning processes of teaching.

Researchers from the methodology of life history (Bueno, 2002, Dominic, 1988; Ferrarotti, 1988; Freitas, 1998; Goodson, 1992, 1994; Monteiro, 2006[44]; Nóvoa, 1992a, 1992b), focusing on personal stories, and the area the teaching profession highlight the contribution of this type of formative research for professional development in the course of oral or written. In the study by Miller (2006, p.223), it appears that the teachers surveyed expressed a formative contribution because, at various times of the interviews, signaled changing perceptions and interpretations of the results of certain teaching practices, after performing the reconstitution of professional paths and configuration of the teaching profession, through written productions. Miller (2006) also shows that the study involving the history of life, knowledge and practices of successful literacy triggers reflections from their own written and oral manifestations of the teachers on teaching. Further

---

[44] Doctoral research of one of the authors, supported by the Foundation for Research Support of São Paulo - FAPESP

analysis regarding the various moments of the Brazilian educational process have been (re) structured during the reconstitution of oral or written his memoirs. This check confirms the importance and contribution of writing practices for vocational training.

Zabalza (1994) states that the teacher - by writing on their teaching, in the form of a diary -, reflect, learn and (re) builds his/her knowledge base and actions. In this perspective, the diaries as a tool to record enable "focus the analysis in practical situations, integrating the two dimensions of referential and expressive facts" (p. 83). The diary writing, to the author, takes place in ways articulated, creating possibilities to configure it in a document of expressive potential. Zabalza (1994), Yinger and Clark (1981) believe that people learn by writing, because, in performing the practice of writing, recreate the experiences, emotions and intuitions recovering and also the organization of experiences into a structured message. Moreover, a person by recording, engages in a process of reflection, creation and revision, able to dialogue with him/herself and assess the facts recorded and his/her relationship with the experienced situation, considering the reality and the goals of his/her achievement. The authors clarify that the writing does not happen in a mechanical and unconscious, show that the writing makes connections between what they already know and new information. The production is personal and active, because the author is responsible for the selection of the submitted information about facts and also the presentation of the report. The writing is active because it refers to a process that involves structuring, organizing, reading, reflection and changes the text. The reflection made possible by keeping diaries for Zabalza (1994), focuses on two aspects: the referential and expressive. Thus, the reflection can refer to the narrated object (e.g., driving lesson, the students' behavior) and the narrator, or the teachers themselves (their teaching, their knowledge, their feelings, emotions).

Zabalza (1994) considers that the diary allows us to observe and learn about the developments, how they occur, the conditions that are intrinsic, the changes that underlie these events and other situations, with two characteristics, longitudinal and historical.

The linear sequence in time with the facts that are narrated avoids the homogeneity of perspective on the events. The teacher writes the characteristics of the facts on a given day and does not return to writing until a next time. Reported each day involves certain perspective on the events, which does not occur, for example, in a written autobiographical narrative unit produced in period, because the perspective of time that this writing was prepared influences the past situations.

The Reflective Diary, covering the diary to reflect the characteristics of the students and the teachers themselves, may be called the Daily Impresses. In general, this kind of diary includes detailed descriptions of the characteristics of students and contains references of own teaching (feelings, perspectives on performance etc.). In this record, we see the dominance of the personal element.

The content of the reflections in the supervised training is related to the experiences of training classes, aiming at the thick description of the facts, as a superficial account involves reflection and analysis too superficial. Trainees, for organizing their day, focused on the actions of teachers and pupils during the training period. These descriptions were more detailed and more simplified. The records included aspects of the teacher's discourse about the actions describing thoughts, reasons for certain actions, the choice of objectives, the procedure of the activities.

That production was daily examined by virtual tutors and the teacher in charge of subject Supervised Pre-Service Stage that included interventions on the content and form of presentation and interpretation of observations and experiences acquired during the insertion.

CONCLUSION

The results obtained during the Supervised Pre-Service Stage on First Years of Basic Education provide some evidence relevant to the assessment of the project of the Bachelor's Degree in Pedagogia UAB/UFSCar, ensuring, for example, the interdisciplinary and some contributions construction of a style of teaching pre-service teachers of the First Years of elementary school. It also enabled the structuring of the continuing process of training courses in the area of Early Childhood Education, School Management and Education of Youths and Adults, allowing adjustments in the first years of supervised training and the subjects related to other training programs, with regard to aspects and successful and the negatives.

The study of history of production of the diaries revealed that, in the early stage, the students expressed dissatisfaction with the compulsory training in the course, especially those have been already working in that teaching. That sentiment was modified in the insertions in school, when they realized that teaching in the early years is very different from doing it from the adolescent or young adult.

The interaction among the trainee and the trainers allowed the school to build a closer relationship, healthy and cooperative, aiming to carry out practical action and partnership in the future professional field. Therefore, it was essential that the practices in the classroom were fruits of guidelines, sharing and mutual

aid among the instructors of the school and the university to set forth guidelines for future teachers to value the learning of teaching, still in the training period university. The attitude of sharing experiences, study materials and teaching, as well as the registration of such situations by those involved favored the strengthening of the group, creativity and solutions to the problems faced.

190 - Universities and the Professional Preparation of Teachers in Scotland: an Uneasy Alliance?

Moira Hulme

School of Education, University of Glasgow, UK
moira.hulme@glasgow.ac.uk

Abstract: This paper explores the historical conjunction of teacher education as a professional field and Education as a university subject and educational science. The relationship between teacher education and the universities of Scotland has a long and complex history. Whilst much attention has focused on the potential for policy learning through cross-national comparison, fewer policy resources have been deployed in identifying lessons that might be drawn from the fissures and ruptures of the domestic past. This paper considers the apparent paradox in the nation's historic commitment to popular education, and the relatively recent full (and shifting) involvement of its universities in initial teacher education (post-1990).

Keywords: teacher education, history, educational science.

INTRODUCTION

The history of teacher education in Scotland is a history of struggle. From its inception, formal teacher preparation has occupied an uneasy place between local needs, local administration (school boards, education committees), central control (Scottish Education Department with the schools' inspectorate) and aspirations for concurrent higher education and a self-governing graduate profession. Taking a broad sweep of developments in teacher education from the late nineteenth century, this paper explicates points of cooperation, contest and challenge. The paper is organized in two parts that reflect the 'romance' and 'satire' traditions of writing on the early history teacher education (Cohen, 1999). The first examines the case for university involvement in teacher education, including early campaigns by teachers' associations, school board support for certificated and graduate teachers, and the influence of early pioneers of Education as a university subject who sought to promote teachers' engagement with research. The paper then considers initial opposition to 'universitisation' from within the academy and the Committee of Principals of the Colleges of Education, the shifting position of central government which is principally concerned with issues of teacher supply, and the influence of the church, especially the Catholic church, in retaining influence over the school curriculum and teacher preparation. The stories that unfold do not sustain a consistent narrative of social progressivism, philanthropy and enlightened public action but reflect a constant struggle for jurisdiction over teachers' work and the professional knowledge base of teacher education.

THE CASE FOR UNIVERSITY INVOLVEMENT IN TEACHER EDUCATION IN SCOTLAND

Much has been made of the Scottish 'educational tradition' (Paterson, 2009). Critiques have been offered of 'standard' narrative histories ('Acts and facts'). Humes and Paterson (1983) have noted that the early histories of Scottish education tend to be *'narrative in form, broadly nationalistic in tone'* (pp. 1-2). Histories of teacher education similarly tend to present 'noble stories' (Katz, 1968) of redemption, struggle and progress, offering a sympathetic lens through which to view the politics of professionalization. The following section summarizes and interrogates some of the moves within this mode of emplotment (White, 1973).

The teachers' association

The Scottish teachers' association, the Educational Institute of Scotland (EIS) (established in 1847) made links with universities and 'scientific' research a key argument in their claim to professional status. The EIS claimed membership among *'not only the elementary teachers of the urban poor but also the masters of the secondary schools and members of the Inspectorate as well as university professors in a wide range of subjects'* (Bell, 1990, p. 87). Speaking on the subject of 'Professional Training of Teachers' at the General Meeting of the EIS of 1873, W. Jolly, an HM Inspector of schools, advocated *'systematic training in the*

Theory and Practice of Teaching, by means of a University Course of instruction'. Jolly stated that a university curriculum for teacher training needed to be built through the creation of Chairs and lectureships in Education, the establishment of 'practicing' or 'experimental' schools organised by universities and the creation of an 'educational museum' or 'consulting room' for serving teachers. Reporting this event at a meeting of the Ayrshire Branch of the EIS, William Glasgow (1875) notes the EIS responded by forming a Chair Committee and *'rousing teachers to practical effort on this important matter, to obtain subscriptions for the establishment of Chairs of Education in the Scotch Universities'* (p. 5). First advanced by Professor James Pillans at Edinburgh University in 1834, the first Chairs of Education were eventually financed in 1876 by endowments from the Bell bequest[45], supplemented by the precarious (and short lived) award of a government grant. The first Professors of Education in Scotland were J.M.D. Meiklejohn at St Andrew's and Simon Laurie[46] (previously an Assistant to Pillans) at Edinburgh[47].

The campaign for professional status through the award of higher qualifications was at the same time a strategy to secure positional advantage for some workers over others. Women were denied the right to graduate from Scottish universities until 1893. The 1924 *New Teacher Training Regulations* required male entrants to the profession to be graduates. Higher qualifications were used to justify pay differentials and promotion prospects and to draw gendered curricula boundaries. The Independent Labour Party and the Educational Institute of Scotland (which was opposed to school boards) did little to advance the cause of women teachers[48]. Labour struggles were organised around the primacy of the 'male breadwinner' earning the 'family wage'. The Scottish Men Teachers' Association challenged the case for equal pay in the 1920s (Adams, 1990). Career structures for women teachers in Scottish co-educational schools offered fewer prospects for advancement, although by 1918 women comprised 74% of the profession (Corr, 1997). In 1911 women school board teachers were paid half the mean annual salary of male board teachers. The average salaries of Catholic schoolmistresses were £7 lower than their female board counterparts and £4 lower than Catholic schoolmasters (McDermid, 2009). Between 1880 and 1914 Scottish schoolmasters commanded higher salaries than their English counterparts, whereas Scottish school mistresses (higher in number than male teachers across the UK) were consistently less well paid than English women teachers, although they were more highly qualified (Corr, 1997). The 1935 *Report of the Advisory Council to the Scottish Education Department on the Training of the Woman Primary School Teacher* recommended that courses emphasise the 'practical work of schools rather than a university degree' (cited by Cruikshank, 1970:172).

The school boards

The professionalization of teaching was advanced with the abolition in 1906 of the school-based pupil-teacher system (established from 1846), which had placed teacher preparation firmly outside higher education. Junior studentships (1906-1924) were introduced for school trainees aged 15-18 years. All junior students awarded the Junior Student Certificate could progress to senior studentships undertaken in a designated teacher training institution, with the aim of achieving a fully certificated teacher workforce[49]. The provision of bursaries, maintenance allowances and residential accommodation encouraged recruitment from a wide range of social classes and widened access to teaching in rural areas (Cruikshank, 1970). The response of schools boards to central government intervention varied. Edinburgh opposed the scheme and sought to retain the pupil-teacher system. In contrast, the Glasgow School Board's opposition was based on the narrowing of the teacher education curriculum for prospective teachers to elementary subjects at an early age. A Special Committee of the Glasgow School Board was set up in 1910 to consider the requirements of the junior student system set out in Circular 437 (See Roxburgh, 1971, pp.209-213). Glasgow advocated a system of teacher education that would produce scholarly teachers supported by the EIS, which continued to

---

[45] The bequest of Andrew Bell, founder of the Madras or monitorial system. The Bell bequest had served to support the establishment of elementary schools in Scotland, a need that was overtaken by the 1872 Act, allowing the universities to lobby for a redirection of funds towards the establishment of university chairs (Bell, 1990).

[46] Despite much difficulty is establishing the role of the Chair in Education in relation to teacher education at Edinburgh, Laurie exerted considerable influence on the establishment of day colleges for teacher training in England. For further information on the influence of a 'Scottish diaspora' on schools and universities in England in the twentieth century, see Lowe (2003).

[47] The first English Chair of Education was established at Newcastle in 1895 (Crook, 2002).

[48] The EIS made a small number of women honorary fellows, including Margaret Black of Glasgow, Flora Stevenson of Edinburgh and Carlaw Martin of Dundee (McDermid, 2009, p.347).

[49] Training institutions also provided three additional one-year routes to qualified teacher status: a professional training course for graduates; a course for honours graduates intended to teach higher subjects in intermediate and higher secondary schools; a course for diploma holders from technical/vocational colleges. The different training routes reflected the different qualification pathways in schools at the time, which prepared pupils for Qualifying, Intermediate or Leaving Certificates (Cruikshank, 1970, p.138).

lobby for a graduate profession. The Education Department insisted that any deviation from the junior student curriculum would result in loss of the junior student grant to the Glasgow School Board. A compromise position emerged whereby Glasgow junior students followed an alternative curriculum leading to the full Leaving Certificate, followed by six months teaching experience before entering a training college. The decision incurred the penalty of a reduction in the junior student grant to the level of ordinary secondary pupils.

An interpretation of the school boards as a non-contentious progressive force in education should not be read off from this account of the struggle to improve the education of teachers. Closer inspection reveals tensions and omissions. The struggle to improve the education of teachers and extend the school curriculum reinforced rather than challenged class and gender differences. Corr (1990:46) reports working class women's opposition to the introduction of domestic instruction as a school subject. Domestic education was promoted by middle class women elected to the unsalaried civic work of the school boards (1873-1918)[50]. Adams (1990) reports that the Glasgow School Board (which had a policy of favouring graduate teachers) prohibited the promotion for women beyond the post of infants' mistress, which was only eligible for women aged over 45 years. Married women were barred from teaching in local authority schools in Scotland between 1918 and 1945. A 'resign on marriage' clause, supported by the clergy, was introduced in employment contracts for women teachers in Dundee and Glasgow from 1915.

Cooperation between the universities and colleges

Whilst excluded from formal responsibility for teacher education, there is evidence of local cooperation between universities and the teacher training colleges in the first half of the twentieth century. Professor Alexander Darroch, Edinburgh University, was an honorary Director of Studies at Moray House College of Education in the early months of the Provincial Committee on teacher education established in 1905. William Boyd of Glasgow University acted as part time principal lecturer in education at the Glasgow training college (Brett et al, 2010). Lecturers in education at the Universities of Aberdeen and Dundee gave lectures in education and psychology at the teacher training colleges (Cruikshank, 1970). University chairs in education held dual roles from 1925 until 1951: Godfrey Thomson held the role of Director of Studies at Moray House teacher training centre (and its Demonstration School) whilst also fulfilling the role of research Professor of Education at Edinburgh. At St. Andrew's the Directorship of the Training Centre was combined with the Bell Chair of Education, with William McClelland acting as the Director of Studies at the Dundee Training Centre (Cruikshank, 1970).

The involvement of university lecturers increased the influence of experimental psychology in teacher education. James Drever did much to advance experimental psychology in Scotland, influenced by developments in the laboratories of Leipzig, Jena and Berlin, particularly the investigations of William Wundt (1832-1920) and Ernst Meumann (1862-1915) at Leipzig on perception, memory, intelligence and learning. The borderland between psychology and pedagogy was being occupied by European scholars such as Decroly (1871-1932) in Belgium and Clarapede (1874-1940) in Switzerland to create a new field of 'experimental pedagogy' (Nisbet, 1999). In Scotland, Darroch published *The Place of Psychology in the Training of the Teacher* in 1911. Robert Rusk's *Introduction to Experimental Education* (1912) was based on his lectures given in Dundee and influenced by the work of Meumann. In the same year, Norman Walker of Aberdeen University was advocating the use of intelligence testing for selection purposes. McClelland introduced research in the prognostic value of examinations at Dundee; completing a ground breaking longitudinal study of school careers of 3,000 children reported in *Selection for Secondary Education* (1942). Thomson, who had worked with Thorndike at Teachers College Columbia in 1923-24, pursued his research in the standardisation of mental tests – the Moray House tests - that were extensively used by local authorities in England (1927-1935) (Lawn et al., 2008).

Lawn et al (2008) have charted the development of an influential Scottish School of Education Research (1925-50). Scottish educationists (Darroch, Boyd and Thomson) and the British pioneers of experimental

---

[50] The 1875 Educational Code prohibited certificated elementary school teachers from standing for school boards. School boards were elected every three years. Eligibility to vote in school board elections was dependent on owning or occupying property with an annual rent that exceeded £4 (McDermid, 2009, p.334). (Women of property over thirty were eligible to vote in general elections in the UK from 1918. The vote was extended to women on the same terms as men in 1928). In the first school board election of 1873, 5645 men were returned to serve on Scotland's 980 school boards, in comparison with 17 women. In the final year prior to the replacement of school boards with local authorities in 1918 only 70 women were returned (McDermid, 2009, p.336-7).

education (Drever, Valentine and Vernon[51]) were well travelled and well read. Rusk and Drever held PhDs from Jena (Bell, 1990). Currie's *The Principles and Practice of Early and Infant School* was influential beyond the UK. It was published in New York and Chicago in 1891 and reprinted in 1897. It is notable in affording attention to the application of principles of psychology to early education, as well as providing detail on 'methods' of instruction. A generation later, William Boyd, whose reputation was advanced through membership of the New Education Fellowship, spent a year at Teachers' College Columbia (1930-31) (Brett et al., 2010). The result of travel in Germany and North America, combined with its own 'educational tradition', was the construction of a university-based Educational Studies in Scotland that was heavily influenced by the child-centered thought of Rousseau, Pestalozzi, Froebel and later Dewey, and the European scientific realist movement of experimental education (Wundt, Ebbinghaus, Binet)[52]. From its inception, the study of education as a university subject in Scotland carried tensions between the 'optimism' of progressivism and associationist philosophy and the 'fatalism' of psychometry (Simon, 1983).

Research engagement by teachers

The alliance between the EIS and universities was most strongly advanced through the significant contribution of William Boyd, lecturer in education at the University of Glasgow from 1907, and part time principal lecturer at the Glasgow Teacher Training Centre (see Brett et al., 2010). Higher education and engagement with research were seen by Boyd and embraced by the EIS, as hallmarks of professionalism, necessary in the struggle for professional status enjoyed by medicine and law. The Scottish Education Reform Committee lobbied to advance the involvement of teachers in 'practical research' in 1917[53]. Formed in 1919, the EIS Research Committee sought to promote teachers involvement in research studies using the EIS produced *Scottish Educational Journal* (SEJ). The SEJ Editorial announcing the formation of the modest Research Committee proclaimed, *'Research is the very life blood of a profession. No one can say with truth that Scottish teachers are anaemic'* (cited by Brett et al., 2010, p.595). The Research Committee can claim some success in eliciting the cooperation of teachers in work conducted by Boyd, but much less success in fulfilling the aspiration that teachers might routinely engage independently in small-scale studies of their own classroom practice. It is telling that the first 'experimental' enquiries prioritised by the research committee in the early 1920s focused on establishing common assessment standards in the core subjects of elementary teaching i.e. concern with 'standard tests' as 'measuring devices'. As Brett et al (2010) point out the potential of the profession to secure efficiency gains, independent of government intervention, was attached to its claim for self-regulation. Teacher control over systems for examination and pupil assessment, the currency of schooling, was central to self-determination. Mastery of methods of assessment, demonstrated through the deployment of techniques validated through scientific method, was aligned with professionalism (interpreted as possession of specialist knowledge and expertise). The partnership relation forged between the EIS and the university, to the exclusion of local authorities, limited the potential impact of the enquiries undertaken, given that scaling up from research findings would have required local authority support and coordination; and over-estimated the capacity and willingness of a large proportion of the profession to engage *in,* as well as *with,* research.

The Scottish Council for Research in Education (SCRE) was founded in 1928[54], funded in part by the EIS and in part by the Association of Directors of Education, with the intention of conducting large-scale systematic investigations that would overcome some of the limitations in scope, method and resource of the Research Committee's investigations. Nisbet (1999) argues that the appointment of Rusk, then Head of Education at Jordanhill Training College, as the first (part-time) Director of SCRE marks the dominance of 'scientific' approaches to educational research over the 'school-based curriculum-centered style of Boyd'. The development of SCRE as a collaborative research network has been documented by Lawn (2004). The role of SCRE in contributing to the International Examinations Inquiry (IEI) of the 1930s did much to position Scotland at the forefront of educational research internationally during this period (Lawn, 2008).

---

[51] James Drever was appointed the first professor of psychology at a Scottish university in Edinburgh in 1931. C.W.Valentine was Professor of Education at Queen's University, Belfast (1914-19) and Birmingham (1919-46). Philip Ewart Vernon was appointed to an education chair at the University of London, Institute of Education (1949-64).

[52] The application of psychology to education led to the development of the schools psychological service and to the establishment of a Child Guidance Clinic in Glasgow in 1932 and juvenile clinic in Edinburgh (Drever) (Bell, 1990; Cruickshank, 1970).

[53] Following the example of the Teachers' Guild in England which successfully lobbied for the establishment of an Education Reform Council in 1916 (Nisbet, 1999:7).

[54] Scotland's national research body was founded eighteen years before the National Foundation for Educational Research for England and Wales in 1946.

SCRE developed a specialism in survey research/large-scale educational assessment, contributing to the three Scottish Mental Surveys (1932, 1935-7, 1947); the influential work of McClelland on Selection for Secondary Education (1942); and Assessment for Higher Education (Powell, 1976; Rusk, 1952). Whilst SCRE continued to have connections with the teaching community and education policy makers, the engagement of teachers in original research was not fully supported. The shift from a professional (and professional*ising*) orientation to the role of expert external research consultancy is noted by Powell (1976), who records the move from voluntary efforts of university and college staff with teachers, to contract research undertaken by professional researchers employed full time by the SCRE. (This was in line with the customer-contract model of research commissioning advocated in the Rothschild Report, 1971). The absence of teacher voices or accounts of teacher research is noted by Brown and Wake (1988) in the edited collection, *Education in Transition*, which celebrated sixty years of research by SCRE.

OPPOSITION TO UNIVERSITY CONTROL OF TEACHER EDUCATION

Clerical influence
The involvement of universities in teacher training was enmeshed in debates around clerical influence in the newly formed national system of schooling. Churchmen in Glasgow resisted the creation of university chairs fearing the erosion of ecclesiastical influence on the school curriculum (Bell, 1990). Following the 1872 Act, parochial and burgh schools were transferred to new local authorities (excluding Catholic schools), ending what James Scotland (1972) has described as *'guerrilla warfare between church and municipality for control of the burgh schools'* (p.121). However, teacher training was untouched, with no unified system, leaving continuing divisions within the teaching workforce in terms of length and quality of preparation, salaries and conditions of service. The consolidation of state responsibility for teacher education came with the creation of four Provincial Committees in 1905 (Glasgow, Edinburgh, Aberdeen and Dundee). The Presbyterian Church transferred control of its six colleges to the Provincial Committees and only one college (Catholic Dowanhill College) retained its independence. The anomaly of national responsibility for schooling alongside denominational control of teacher training was partially resolved, precipitated by further division within the Free Church of Scotland (Bell, 1990:95). The formation of the National Committee for the Training of Teachers in 1920 (to coordinate the work of the Provincial Committees) saw the eventual transfer of the remaining denominational colleges into one national system. Today, responsibility for the preparation of teachers for Scotland's 385 state-funded Catholic schools[55] lies with one of the seven universities providing teacher education in Scotland, the University of Glasgow.

University stance on teacher education
It would be ingenuous to suggest that all Scottish universities embraced teacher education with the enthusiasm of the early pioneers or representatives of teachers and the school inspectorate, such as those cited above. With the advent of state education, university professors were actively engaged in marking the boundaries of their specialised activity and fragile resource[56]. Whilst the universities of St. Andrews and Edinburgh pursued and gained chairs in Education in 1876 in an attempt to establish new markets in pedagogic expertise, the University of Glasgow did not respond. The institution of a 'Paideutic Chair' was vehemently opposed by Glasgow faculty in the late 1890s. The first Chair in Education was not established until 1951 when Stanley Nisbet was appointed. When Simon Laurie proposed a role for St. Andrews University in teacher training, with Madras College as a practising school, it was rejected by Government in favour of maintaining distinct (and cost effective) roles (Cruikshank, 1970). Bell (1990) notes how, by limiting the role of universities to teaching 'the theory and science of teaching', the first Chairs were restricted to offering non-credit carrying courses to volunteer enthusiasts. At this juncture, the opportunity for university involvement in mass initial teacher education in Scotland was lost. The separate roles of the universities and the training colleges became established in state financed 'concurrent' modes of attendance,

---

[55] There are 2,722 schools in Scotland of which **389** are state-funded faith schools: **385** Catholic, **1** Jewish and **3** Episcopalian.

[56] Scottish universities were not affluent and fees for university attendance were comparatively low. Bell (1990, p.89) reports that university professors often provided 'junior classes' to local students as a form of pre-degree secondary education and benefited directly from fees. He goes on to note that whilst *'Oxford, Cambridge and Dublin received an annual average income of as much as £200 from each student, in Scotland it was a mere £12'* (p.89). The distinctive arrangements for the education of the urban middle class in Scotland were noted by Matthew Arnold (1868, p. 622), *'Instead of making the student, as in Germany, pass to the university through the prima of a high school, Scotland lets the University and the High School of Edinburgh compete for schoolboys; and the University recruits Greek classes from the third and fourth forms of the High School'* (Cited by Scotland, 1969, p.332).

initially by advanced (male[57]) scholars. It was not until the *Robbins Report* (1963) that four BEd courses for prospective primary school teachers were created in Scotland validated by the universities and modelled on existing Ordinary degree courses: Aberdeen in 1965, Jordanhill and Moray House in 1966, and Dundee in 1967. The existing Scottish EdB degrees (part-time advanced courses for serving teachers) were re-modelled as MEd courses (Crook, 2002).

Central government workforce planning

Central government is primarily concerned with regulation of the quality and supply of teachers across Scotland's schools. Teacher training at the turn of the 20th century was governed through an established partnership between the Scottish Education Department (as dominant partner), the schools inspectorate and the colleges. Following the creation of four Provincial Committees in 1905 (Glasgow, Edinburgh, Aberdeen and Dundee), a system of strong central control over teacher education existed until the late 1950s (Marker, 1994). When the Scottish universities sought greater involvement in teacher education the issue of workforce planning was used to rebut claims to higher education jurisdiction in the field of professional preparation. When some universities petitioned for involvement in teacher training in 1888, motivated by the availability of a government grant for every student teacher who successfully completed training, the *Scottish Education Inquiry Committee* declared in favour of continuing the existing concurrent system. The Education Department[58], with the schools' inspectorate, was able to exert close control over the colleges and had no such precedent of inspection and regulation in the universities.

The Report of the Advisory Council on Education in Scotland, *Training of Teachers* (1946) (equivalent to the McNair Report in England) once more demurred against transferring responsibility for teacher education to the universities (see Kirk, 2002:2). Richardson (2002) notes the rationale offered by SED (1946) in its assertion that teacher training would be, *'to the detriment of the higher scholarship which has thrived so well under their guardianship'*. The 1946 Report recommended the extension and broadening of college-based teacher training and drew attention to the need for continuing in-service provision. In 1958 the influential Scottish Council for the Training of Teachers (SCTT) replaced the National Committee as the coordinating and advisory body for teacher education. In acquiring independent governing bodies, the colleges had greater autonomy to develop their individual character and shape the professional identity of teachers. However, as Marker (1994) notes, *'this move towards greater independence for the colleges was still within a framework of central coordination'* (p. 14). Among the standing committees advising the SCTT, the Committee of Principals (which met monthly) exerted considerable influence on policy (composed of the seven college Principals, with greater power held by the four city colleges and the SED Assessor team). During the late 1950s and 1960s the relationship between the Principals and the SED was close, consolidated by a shared understanding of aims and regular formal and informal consultation to capitalise on the expertise commanded by the Principals (a process characterised by Marker (1994) as one of classic 'bureaucratic accommodation').

In the post-war period, the issue of teacher supply attracted greater concern[59], than the content of teacher education, which was largely devolved to college level decision makers (Marker, 1994). A Special Recruitment Scheme[60] was initiated in 1951 to alleviate teacher shortages. Marker (1994) notes that the sections of the SED Annual Reports that relate to teacher training during the 1960s and 70s are dominated by, *'teacher recruitment, pupil-teacher ratios, the elimination of uncertificated teachers, or the problem of maldistribution and the working of the designated schools scheme'*(p. 68). The persistent problem of teacher supply acted as the catalyst for SED to develop its 'intelligence capability' (McPherson and Raab, 1988, p.229) which led to the production of standardised national formula for forecasting staffing requirements, the 'Red Book' (SED, 1973). This strengthened central control and reduced local decision making; a move that would have implications for teacher education when the problem turned from one of shortages to over-supply after 1975. As the problem of teacher supply receded, some significant opportunities to improve the system were lost. SED rejected proposals in the Brunton Report (1963) for the promotion of closer partnership relations between schools and colleges (Marker, 1994).

In addition to demographic factors, economic and political factors were powerful influences on teacher education policy. The financial crisis and erosion of the post-war consensus in the late 1970s contributed to

[57] For work that addresses the position of women school teachers in Scotland see McDermid (1997).

[58] The Scotch Education Department was based in London until 1922. Dover House remained the official address until St Andrew's House, Edinburgh was opened in 1940 (Scotland, 1972).

[59] Issue of supply arose from changing pupil demographics associated with the birth rate and staying on rates in secondary schools following the ROSLA.

[60] Provision of student grants for course fees and maintenance to encourage career changers to consider teaching.

pressures for contraction. The publication of *Teacher Training from 1977 onwards* (SED, 1977) heralded the end of the ten college system with a number of mergers and closures. The proposed closures were temporarily reprieved in the face of organised resistance and a high profile media campaign in 1977. Facing an uncertain future, the colleges re-calibrated their provision by expanding school-focused in-service provision, drawing on the educational case for career-long professional learning. Further scope for diversification into new or existing areas of professional or general education, within public sector funding constraints, was limited. Following the change in UK government in 1979, the postponed college closures were announced in *The Future of the College of Education System in Scotland* (SED, 1980). Whilst primarily tackling over-capacity through the closure or merger of three of the ten colleges[61], the SED document also contained concessionary mention of moves towards an all-graduate profession (a long held ambition of the EIS) the development of research in colleges and devolved in-service provision.

From the mid-1960s the composition of the policy community changed as new partners entered and new bodies such as the Open University and Council for National Academic Awards (CNAA) began to operate in Scotland. The General Teaching Council of Scotland (GCTS) was founded in 1966. In 1967 the college monopoly on pre-service teacher training was broken with the establishment of the University of Stirling BA/BSc with secondary teaching qualification (funded through the Higher Education Grants Committee, rather than the Scottish Executive Education Department). The expansion of the BEd degree in the late 1970s reduced perceptions of a two-tier system among the training colleges. With the end of the Scottish Council for the Training of Teachers, the influence of the Committee of Principals diminished and their role shifted from one of policy formation to reaction to proposals and reports prepared by the SED and the GTCS.

RESEARCH AND TEACHER EDUCATION IN THE POST-WAR PERIOD

By the 1950s discipline-focused educational research in Scotland, as elsewhere, had developed into a specialist field requiring advanced statistical and psychological training. Nisbet (1981) suggests that educational research was *'done by those outside the classroom for the benefit of those outside the classroom'* (p. 5). He argues elsewhere that the growth of contract research led the small but developing Scottish research community to form a *'technocratic alliance with the power blocks in education'* (Nisbet, 2005, p. 34). Psychology had secured a position of dominance and the professional application of research generated within collaborative networks with the cooperation of teachers had diminished. Within the field of educational research, alternative sub-divisions were in evidence but these did not yet challenge the place occupied by psychology. Boyd's legacy found expression in the teacher research movement pioneered by Lawrence Stenhouse in the 1960s, (awarded the William Boyd prize in education for a first class MEd at Glasgow University in 1956) and influenced by his experience teaching in secondary schools in Glasgow and Dunfermline. Stanley Nisbet's *Purpose in the Curriculum* (1957) promoted curriculum studies as field of study in Scotland.

The retirement of Thomson in 1951 marked the end of the dual university Chair/College Director appointments. The dominance of psychology in university Education Departments in Scotland and elsewhere was challenged. The first issues of the *British Journal of Sociology of Education* and the *British Journal of Educational Studies* were published in 1950 and 1952 respectively (See Richardson, 2002; and Ball, 2008). In Scotland, the commitments of individuals and the circumstances of their appointment are significant in accounting for institutional departures from particular pathways. The Bell Chairs were again a site of contestation in the re-making of university engagement with teacher education. At Edinburgh, J.G. Pilley was appointed to work with Diploma candidates. Bell (1990) describes Pilley as a humanist whose *'main concern was to produce insightful teachers rather than a technically competent elite'* (p.103). At St Andrews, J.W.L. Adams, 'a former classics inspector', was appointed[62]. In the 1970s the exclusive focus on testing pioneered in Room 70, Moray House, was challenged by Liam Hudson (Bell Professor 1968-1977)[63] and his successor Noel Entwistle (1978-2003). The contribution of David Hamilton and Malcolm Parlett, also Edinburgh based, was significant in pioneering alternative approaches to curriculum research (Richardson, 2002). By the 1980s, it was the Department of Sociology at Edinburgh, through the work of the Centre for Educational Sociology (CES) that had achieved a strong track record in research council grants for school-related studies (Bell, 1990).

---

[61] Craiglockhart merged with Notre Dame to maintain its faith identity, although initially the SED preferred option was for merger with either Moray House or Dundee (Marker, 1994:133-5).

[62] The Education Department at St Andrews was closed in 1966 and responsibilities transferred to the newly independent Dundee University.

[63] A psychologist who specialised in creativity and teaching the gifted child. See, *Contrary Imagination* (1966) and *Frames of Mind* (1968).

In debates on teacher education the artificial distinction between theory and method established in the 1850s continued to be marshaled to support contrasting positions. James Scotland (1973), reflecting on the early 1970s, notes that *'one of the main criticisms of the colleges of education is of the undemanding intellectual content of their courses'* (p.40). The explicit professional orientation of the colleges, their regulatory role and the need to assert the distinct place of the colleges in the higher education landscape did not support the prioritisation of research activity; although an Inter College Committee in Educational Research (ICCER) was established to coordinate efforts. The research record of former college staff is the focus of continuing debate, both in terms of the *use of research* to inform teaching and course design, and *involvement in research* (Lomax, 1973; Scotland, 1973). Taylor (1969) records how 'action' research undertaken by teacher educators was *'regarded with tolerant scepticism by professional research people, who are very conscious of the lack of research training of the many of those involved and of the way in which the topics chosen reflect immediate and pressing concerns, rather than issues of long term theoretical importance'* (p. 225). Shipman (1969) notes disparagingly how the historical development of the colleges as 'training institutions', outside universities, positioned them as *'wholesalers rather than producers of new ideas'* (p. 257).

Divisions between 'the professional' and 'the academic' were again mobilised in the 1980s. Writing in 1984, Gordon Kirk, then Principal of Moray House and (then) defender of the monotechnic principle, lamented *'an immature hankering after university recognition'*(cited by Kirk, 2002, p.15). First mooted in 1830s, the eventual merger of the remaining monotechnic colleges of education[64] with the universities came in the 1990s, following the closure of CNAA in 1992 which had validated the BEd degree in some centres from 1983. University education of all teachers, a long-term goal of the EIS, was achieved; albeit regulated through competency-based course criteria (SOED, 1993). After a brief engagement in the examination schoolmasters between 1861-64, and the thwarted efforts of the Bell Chairs endowed in 1876, universities and the training colleges settled into a concurrent system from 1873 until 1955. Universitisation eventually occurred as a result of political and economic drivers, as much as the case for scholarly teachers and enhanced professionalism (that had underpinned accounts of EIS opposition to the English Revised Code of 1863 and the Glasgow School Board's opposition to the limitations of the Junior Student system in 1910).

The legacy of two centuries of debate on the location and mission of professional education are not easily ignored. University Departments of Education and the colleges had histories of collaboration, which was often but not always cordial. The newly formed Faculties of Education entered universities engaged in the Research Assessment Exercise. According to managers at the time, Faculties of Education in research intensive universities sought to respond by promoting research as a 'collegiate undertaking'. Whilst opportunities were created for engagement in research activity in the early post-merger phase (including support for the completion of higher degrees), 'former college staff', appointed for their professional experience (Menter, 2010), were not expected to be research active. The new Faculties continued to involve a high proportion of secondees (associate tutors) in response to an expanded student intake as a result of projected demand for teachers. This translated into different roles (and statuses) with implications for the professional status of teaching and the professional identity of teacher educators. An enduring bifurcation of research and teaching persists in many university Schools of Education. The university basis of teacher education and the place of research in initial teacher preparation is the focus of continuing deliberation (Donaldson, 2011).

CONCLUSION

This paper started from the premise that the history of education in the UK, continental Europe and North America has tended to be dominated by 'noble stories' (Cohen, 1999). The history of teacher education in Scotland is no different. What is missing from these 'liberal' or 'progressive' accounts is an explicit politics of reform that acknowledges the struggle for influence of the various parties involved.

This attention has drawn attention to the strategic agency of those who seek to influence policy. Acts of resistance include those of working class women to the promotion of domestic subjects by middle class school board women; the resistance of faith communities to the common school and non-denominational teacher education; the resistance of teachers' unions to equal pay for women teachers; the resistance of some within the academy to the elevation of education as a university subject and the inauguration of chairs in education; initial resistance to universitisation by college principals who saw themselves as defenders of the monotechnic principle and an ethos of 'service' in teacher education. Histories of teacher education are not

---

[64] St Andrew's College with the University of Glasgow; Jordanhill with Strathclyde University; Moray House with Edinburgh; Northern College with the universities of Dundee and Aberdeen; Craigie College with Paisley (now University of the West of Scotland).

without 'spectacle' e.g. the city-wide procession to officially open the newly built Glasgow Normal Seminary in 1837 or the leading out of staff and students by David Stow eight years later following the 'Disruption' i.e. the split between the Church of Scotland and the Free Church of Scotland. Neither is the history of teacher education without 'heroes' e.g. the positioning of William Boyd (and later Lawrence Stenhouse) as the 'hero' of school-university collaborative research, supporting the professionalization for *teachers*; or casting Robert Rusk (and the Scottish Council for Research in Education) (and later Godrey Thomson) as pioneers of 'educational science' supporting the professionalization of *researchers*[65] and the international standing of Scottish educational research.

Critical engagement with theory and explicit consideration of the values, shaping myths and political agency of the micro-communities of teacher education may help to illuminate contest, challenge and dissonance between actors implicated in the enactment of reform and the production of stories of reform. The cultural historical perspective of critical policy sociology is attuned to such endeavour. Inter-disciplinary and self-reflective inquiries might consider and connect the dominant modes of emplotment in historical narratives and identify the reproduction of battle lines within contemporary educational discourse. The purpose of such activity is not to 'condemn' or to 'celebrate' (Cohen, 1999, p.53) but to promote constructive reappraisal that might generate a 'usable past' that confronts rather than repeats iterative challenges.

199 - The Professional Progam of Teacher Education. The Representation of the Students

Laura Agrati[1], Chiara Gemma[2], Cosimo Laneve[3]

Department of Scienze pedagogiche e Didattiche, University of Bari, Italy
[1]laura.agrati@libero.it; [2]c.laneve@sc-edu.uniba.it; [3]c.gemma@sc-formaz-uniba.it

Abstract: Among the changes that have affected the teacher training process for the last 20 years, there is the reorganization of the ways that facilitate the matching of theoretical knowledge and practical experience (e.g. the model of alternation, tutorials and workshops, and the introduction of experienced belonging to the schools).

The article aims to show the changes in the educational curriculum for student teachers, highlighting the following points:

a) in the first part, the components of the educational curriculum at the University of Bari and at the Suor Orsola University in Naples.

b) in the second part, the findings of a recent exploratory survey which aims to understand how future teachers (student-teachers) represent themselves and test the outcome of the meeting between theoretical knowledge (in university courses) and practice (during courses at school).

(all of this has been accomplished by having about 400 undergraduate students, studying an education degree course, complete a questionnaire on representations)

The results of this study and reflections may well show the strong interest amongst policy makers who constantly seek new strategies in facing the challenges of education.

Keywords: teacher education, professional development, theory-practice relationship.

INTRODUCTION

Among the most significant changes that have affected teacher training for the last 20 years, there is the reorganization of vocational curricula in ways that facilitate the match between *theoretical knowledge* and *practical experience*. The following are the foremost innovations:

a) on a general level, the curriculum of *alternation* (Altet, 2009) between the theoretical component (university courses, and in some ways, workshops) and experience (training);

b) on the level of action, the introduction of a *didactic laboratory* to facilitate a reflection on the application of theories (consider the experiences of reflective workshops and didactic ones) (Agrati, 2008);

c) on the institutional level, the reorganization of the figures responsible for the teacher training: the teacher - the guarantor of a type of 'top-bottom' knowledge – but also most *experts* from actual schools (tutors and mentors are, as guarantors, rather, recipients of a 'bottom-up' knowledge).

These innovations have come forth as a result of years of reflection and commitment to the educational research (Zeichner & Liston, 1996; Lenoir - Bouillier-Oudot, 2006), reflecting also the outcome of the mutual efforts from both institutional and individual universities (eg . Loi No 89-486 du 10 juillet 1989 Act. No. 53, March 28, 2003).

If this, however, is what has been going on *upstream*, what has been going *downstream* then? Metaphors aside, which kind of impact have these developments had on teacher education curriculum? More specifically, what's their impact on student-teachers? What is the relationship they have developed with respect to innovative components of the curriculum (*courses*, *workshops*, *expert* figures etc.). How do they really perceive this match between theory and practice? In an attempt to answer these questions, the Italian universities of Bari and Suor Orsola in Naples have cooperatively conducted a two-year research on this subject.

The paper:

a) the first part, highlights the components of the current teaching curriculum in Italy which clarify the scope of news, especially after the recent reform (D.M. n. 249, 10/09/2010);

b) in the second part, there are the outlines of a recent exploratory research that reveals the student-teachers' opinions on the components of their current curriculum.

This study represents a first step of a broader reflection on the effectiveness of vocational teacher training today and, therefore, it also accounts for the choices that policy makers have made in planning out the teacher training outlines.

THEORETICAL FRAMEWORK
Theory and practice in pre-service teacher education
As Laursen (2007) has already pointed out, overcoming the perceived gap between theory and practice in pre-service teacher education is a widespread endeavor (Westbury et al., 2005). Today's dominating view is that theory and practice should be integrated (Leinhardt et al., 1995). Reflection is often viewed as the way to achieve this integration. According to the integrative and reflective approach student teachers are encouraged to construct their own idea of education integrating their experiences and personal practical knowledge with general theory (Shin, 2006). Alternatives to the 'application-of-theory', several models of teacher education stress the continuing cycle of interplay between theory, practice and reflection as the way to promote changes in student teachers' attitudes and practices:
- the constructivist (Kroll, 2004) or social constructivist approach that promotes students to develop grounded theories based on information gathered from the world of practice;
- the new model of 'realistic approach' (Korthagen, 2001) is based on the idea that students begin teacher education with rather persistent subjective theories of teaching.

'Reframing' of the students' mind requires much more than just presenting new theoretical frameworks to them. Instead the 'realistic teacher education approach' aims at the students having practical experience with ways of teaching that slowly can inspire new ways of thinking about teaching.

As recent reforms in this field show (see fig. 1), it need to establish a more efficient connection between theoretical frameworks and practical experience, and reflection on personal experience were both institutionally introduced in Italy along with the redefinition four components of the curriculum.

TC: *theoretical courses*: these courses provide student teachers with a theoretical frameworks for *traditional subjects* (Italian, Mathematics, Geography, etc..) and *transversal subjects* (Pedagogy, Sociology, Education etc.).

W: *workshops* are run by university professors or experiences figures and pertain to practical aspects of theoretical courses.

DT: *"direct" training*: it is a period during which the student-teachers have their chances of familiarizing themselves with practical experience at a school, as they are monitored by headmasters or mentors (an experienced teacher).

IT: *"indirect" training*: these are reflection meetings in which the student-teachers and their supervisors (an experienced teacher usually associated with the university) share their respective reflections on their practical experience at school.
Fig. 1: The four components of teacher education curriculum

The student-teachers' conceptions

Studies on people's conceptions, which were born within sociological and social psychology (Moscovici, 1981), have the advantage of opening new perspectives on identical objects and overcome the truism that has often innervated the settings of traditional research: reality is self-evident and the subjects' idea of reality does not affect their knowledge of it).

Conversely, conceptions – which are defined as 'ordinary, everyday attitudes that are often less naïve than they appear (...) conceptions (that) are actually social constructions, with a multiplicity of significances' - are strictly related to different social integration and the way of thinking and acting of every single person (Mugny - Carugati, 1988).

With regard to teacher training, the first investigations on what teachers' think date back to the 80s and were concerned with finding out the school teachers' opinions on teaching, students, and classroom mood (Elbaz, 1984). These studies have the advantage of opening new perspectives on teacher practice as well as on the complex dynamics of teaching and learning in order to understand that there is a clear difference between formal knowledge and 'second-hand knowledge (Shulman, 1987).

The investigation on student-teachers' conceptions have, for their part, the opportunity to reveal research perspectives on the curriculum of training as well as on the perceived interconnection between theory and practice (Tillema, 1998)

Using the Jordell model, Schmidt and Knowles (1995) have shown that 'fresh' teachers (novices), when faced with concrete situations of ordinary school life for the first time, tend to act on the basis of four levels of influence:
- a personal level: biographies, previous experiences and as those at vocational education institutions. At this level, those most likely to be internally affected are newly appointed teachers;
- an environmental level: class, context, students, teacher-pupil interaction;
- an institutional level: not only school boards, principals, and parents but also the setting of curriculum and administration;
- a structural level: with particular reference to economic, social and political issues with which the school is involved.

The factors that are likely to influence the initial training of teachers can be grouped in the following four dimensions:
- personal stories and models of past actions that determine the present conduct;
- developing an understanding of themselves in the role of teachers;
- problems associated with planning, teaching and classroom management;
- the problems of the school environment and relationships with tutors or mentors.

Although the literature on teacher education and on theory and practice in education is enormous only few research projects have focused on the student teachers'conceptions. Some authors have noticed that beginning student teachers expect to be told how to teach (Jong et al., 1998, Loughran, 2005). The usual response from teacher educators and researchers confronted with this view has been that this expectation ought not to be met and that student teachers instead should learn how to reflect on teaching (Zantig et al., 2003, p. 207).

THE INVESTIGATION OUTLINES AND METHODOLOGY

Our study aims to investigate the student-teachers' conceptions about the components of the education curriculum, what they make of theoretical courses (both basic and pedagogy-based ones); their opinions on direct and indirect training (the experience matured in the classroom in close contact with pupils and mentors, and meetings with their supervisors); workshops (both interdisciplinary and transversal); and, finally, all factors that, according to Schmidt and Knowles' proposal, would act on the initial teacher training.

In particular, we tried to find out the extent to which student-teachers detect a relationship between the components of the abovementioned curriculum, and their personal involvement with such components in terms of knowledge, skills, and assessment.

Our research questions were:
- how do student teachers view the components of teacher-education curriculum?
- what are student teachers' conceptions about them?
- what type of relationship between them did they detect?

The survey - an internal research promoted by the University of Suor Orsola in Naples - was conducted on a two-group, semi-experimental project (Becchi, 1997) based on a specific sample, which is divided into two steps.

293

During the first step - conducted in october 2010 - we administered a questionnaire about the conceptions of 400 students-teacher respectively enrolled at the University of Bari and Suor Orsola Benincasa in Naples, and we analyzed data focusing on certain aspects, as explained below.

In the second - in december 2010 - we conducted in-depth interviews on a representative quota of the same sample (80 students including 40 from the University of Bari and another 40 from University of Suor Orsola in Naples) determined on typological criteria – *gender* and *experience* - and we then proceed to the transcripts according to the lexical-textual approach to verify the consistency of the data collected through the questionnaire (Best - Tuzzi, 2006) (Bolasco, 1999).

The sample

The 400 students-teacher were divided into two groups: the first group consisted of 200 students registered at the first year of the primary education degree course at the University of Bari, and the second group of 200 students registered at the fourth year of the primary education degree course at the University of Suor Orsola Benincasa in Naples. The following are the sample's characteristics:

Gender: 320 females (80%) / 80 males (20%)
Age: average age of the first group (20 years old), average age of the second group (23.6 years old)
Experience (students studying a second degree, or possessing teaching experience): the first group (19%), the second group (32%)

The two groups are therefore typologically different for the following reasons:
- The *first group* consists of students at the beginning of their degree course, with little training and little theoretical experience. Also members of this group were younger and so with few years of teaching experience;
- The *second group* consists of students at the end of their degree course who have completed over 300 hours of training and with an average of 20 theoretical courses studied. On average, this group consisted of older students with a few years of teaching experience, though without a formal certification.

The questionnaire

The questionnaire administered to the 400 students in the first step follow after a meeting to present the survey. It is a structured questionnaire consisting of 60 items - including 50 multiple-choice questions - subdivided into 6 sections and 4 section respectively on *theoretical training*, *indirect* and *direct training* and *workshops*. It was built through pilot interviews on the re-elaborated on the model of teachers' conceptions designed by Mugny and Carugati (1988) and Novelli (2003, 2005). Here are some examples from the 4 sections of our interest:

Theoretical Courses		
1. What do they do?	**2. What makes them more efficienti?**	**3. Knowledge/skills mostly refer to:**

Direct Training		
13. What does it do?	**14 What makes them more efficient?**	**15 Knowledge/skills mostly refer to:**
☐ Provide further contents ☐ Build actual skills ☐ Provide an idea of the 'world of school'	☐ Knowledge connection ☐ Mentor availability ☐ Concrete actions	☐ Theoretical course ☐ Indirect training ☐ Workshops

16,17,18 What would you rate the connection between the abovementioned criteria and the following:

Theoretical course	☐ *inexistent* ☐ *scant* ☐ *high* ☐ *very high*	Indirect training	☐ *inexistent* ☐ *scant* ☐ *high* ☐ *very high*	Workshops	☐ *inexistent* ☐ *scant* ☐ *high* ☐ *very high*

Workshops		
19. What does it do?	**20. What makes them more efficient?**	**21 Knowledge/skills mostly refer to:**
☐ Provide further contents ☐ Build actual skills ☐ Link theoretical to practical knowledge	☐ Knowledge connection ☐ Teacher availability ☐ Concrete actions	☐ Theoretical course ☐ Indirect training ☐ Workshops

22, 23, 24 What would you rate the connection between the abovementioned criteria and the following:

Theoretical Course	☐ *inexistent* ☐ *scant* ☐ *high* ☐ *very high*	Indirect training	☐ *inexistent* ☐ *scant* ☐ *high* ☐ *very high*	Indirect training	☐ *inexistent* ☐ *scant* ☐ *high* ☐ *very high*

Data Analysis
Questionnaire
We proceeded to describe data through *average calculation*, *standard deviations* (σ) and *standard scores* (z) for the values obtained.

We have also performed an *analysis of variance* (ANOVA) based on the comparison between the features of the two groups of student-teachers as they emerged from the data collected during descriptive phase. We have, in fact, detected a high and positive correlation between values concerning the first group and the

second – bear in mind the latter group are more experienced – in reference to *theoretical courses* and *training*.

The statistical comparison between the first and the second group of student-teachers reveals significant difference for all items ($p < 0.001$) higher, as a matter of fact, in the sections dealing with *theoretical courses* and *direct training*. To sum it up, we are here looking at these differences as they emerged, stressing the group variations.

If we compare the responses to the item 1 with those to the item 13, which respectively relate to the function of *theoretical courses* and *direct training*

	Gruppo I	%	Gruppo II	%
■ Basic	96	48,0%	90	45,0%
■ Notions	84	42,0%	95	47,5%
■ Pre-pratica	20	10,0%	15	7,5%
Fig. 2: The function of course

	Gruppo I	%	Gruppo II	%
■ Knowledge	69	34,5%	60	30,0%
■ Skills	74	37,0%	118	59,0%
■ Idea	57	28,5%	22	11,0%
Fig. 3: The function of direct taining

we will notice that the first group ascribe a slightly higher cognitive function to the *theoretical course* ('provide basic knowledge') than guidance ('provide general notions') and, with reference to training, the group are set in attributing cognitive ($z\ 0.26$) and enabling values in equal measure ($z\ 0.83$).

In the second group there seems to be a slight bias towards the importance of theoretical courses, while in terms of direct training, there seem to be a significant prevalence of enabling values ($z\ 1.06$) over cognitive values ($z\ -0.13$).

Let us now compare the items 4, 5, 6 and 16, 17, 18 which we have already allowed us to find out what type of spontaneous references student-teachers made between the components of the curriculum. Here is what the comparison reveals:

	Gruppo I	%	Gruppo II	%
I. T.	65	32,5%	33	16,5%
D.T.	68	34,0%	105	52,5%
W.	67	33,5%	62	31,0%

Fig. 4: The link of course

	Gruppo I	%	Gruppo II	%
I. T.	70	35,0%	58	29,0%
T.C.	68	34,0%	87	43,5%
W.	62	31,0%	55	27,5%
Fig. 5: The link of direct training

the *first group* have always shown a certain degree of uniformity of cross-references between theoretical courses and the other components of the curriculum (workshops, direct, indirect training) while the second group clearly show prevalence of theoretical courses over external training (z 1.05) and, interchangeably, the latter with the first (z 1.15).

A first analysis of the responses, based on the actual data reported, are enough for us to draw some considerations. Their statistical significance (p 0.052) is not very high, given the limited sample.

It is interesting to point out one aspect that pertains to the relationship between the *experience* variable - based on the years of posthumous school experience, oftentimes precarious work - and a consideration of the components of the curriculum, in particular, the relationship between theoretical course and direct training. This has emerged through by intersecting the items 4, 5, 6, and 16, 17, 18 with the years of experience claimed.
Fig. 6: Realation b.w. "link course/direct training" – "experience"

We should note that the higher is the number of years of experience (e.g. 6 years), the more positive is the assessment of the correspondence between theoretical courses and training (see solid line 'very high'). Conversely, fewer years of experience reflect a negative change (see dotted line 'inexistent').

The analysis of item 4, 5, 6, and 16, 17, 18 confirms, indirectly, the outcome of the analysis of the items 3 and 15 where the second group – the older and more experience one - said to recognize an actual reference between theoretical courses and direct training.

Please note that this trend should be subject to more detailed statistical analysis (analysis of variation - ANOVA) before being taken as indicator of a correlation. For the time being, we can consider the experience variable as an 'influence factor', but not nearly big enough to be considered an actual 'cause' that could lead us to recognize the relationship between theoretical courses and direct training.

Interviews

The data were analyzed primarily by meaning categorization (Kvale, 1996, p. 196) aiming at identifying the student teachers'conceptual structure concerning respectively the four components of the curriculum. Categorization means that theinterview is coded into categories and thus can reduce a large text into a few tables and figures.

The corpus of content analysis includes 40 interviews classified into six groups according to quantitative criteria (by years of experience). From a statistical point of view our corpus includes N= 84.576 word-tokens (statistical textual units) and V= 7.041 word-types (item). A word-token is a particular occurrence of a word-types and N measures the size of the corpus. The vocabulary includes the list of V different word-types and the frequency of occurrence of each word-types is given by the number of corresponding word-token repeated in the corpus (Bolasco, 1999).

In order to increase the amount of information conveyed by statistical textual units, we can recode the corpus and work with complex textual-units (CTUs) instead of simple word-types. The analysis allows to distinguish among different kinds of CTUs (e.g. keywords concerning three education contexts, the cognitive - *know-what*, the enabling - *know-how* and the valuable - *know-why*) (Laneve, 2001).

E.g. CTUs of definition

CTUs	Knowledge	Skills	Values
word-types	Information Notions Data Concepts etc.	Mastery Dexterity Tactfulness Familiarity Ability Competence etc.	Considerations Reflections Assessment Reasoning Decisions Choices etc.

In order to obtain a graphic representation of the system of relations existing among groups and CTUs correspondence analysis techniques were implemented (Greenacre, 1984).

Let us focus now, for reasons of synthesis, on the analysis of the terms used to describe the *theoretical courses* and *direct training*.
Fig. 7: The course definitions words

With regard to *theoretical courses*, the student-teachers very seldom will use expressions that fall into the enabling category while there is a predominant reference to the expressions that belong to cognitive category.

However, note that as the years of experience increase (see solid line "knowledge"), the use of expressions that belong to the cognitive category decrease significantly, with a higher incidence of references to expressions of typical of the valuable and enabling categories.
Fig. 8: The training definitions words

As far as direct training is concerned, we can see that the expressions that relate to the enabling category are predominant in each cluster of years of experience. However, it is interesting to note that the increase of years of experience is accompanied by an increase in expressions concerning the value and the enabling categories, almost indicating a pairing frequency in the case of student-teachers with 6 years of posthumous school experience.

RESULTS
In general we can say that the use of the qualitative interview technique – in relation to the quantitative data of the questionnaire - was used to verify the consistency of data that emerged from the items of the questionnaire in the first part of the investigation.

The first thing to note is about the function attributed to the *direct training*. The analysis of the questionnaire has shown, as already explained, a substantial *enabling* characterisation - more pronounced in the second group than the first (see fig. 3), as confirmed by the interviews.

The second remarkable aspect is the function of *theoretical courses*. Both the questionnaire responses and the analysis of the interviews reveal prevalent references to the *cognitive category* (see fig. 2 – basic knowledge and notions, fig. 7 – knowledge) with fewer references to the enabling category in either case (cf. Fig. 2 - pre-practice, fig. 7 - ability).

Both aspects seem to confirm the canonical images attributed by the research and institutions to the two most epistemologically significant components of the educational curriculum.

In light of this, more interesting are the results of the analysis of items 3 and 15, where group II showed mutual references between theoretical courses and external training.

As supported by the analysis of item 4, 5, 6, and 16, 17, 18, it also appears that students with school experience are more likely to recognize the references between the information provided in theoretical courses and their teaching experience in school and to recognize the close relationship between the epistemic components of the two moments - one cognitive and theoretical, and the other practical - although these are clearly different (see fig. 2 and 3).

We are still waiting for the outcome of the tests on the other components of the curriculum (workshops and indirect training) and for the analysis of variance of the data just presented with the *experience* variable to refer to a possible correlation in this regard.

We can, however, safely state that the relationship between theory and practice is more prominently perceived by experienced student-teachers in theoretical courses and training than by novice student-teachers, who instead treat every part of the curriculum indistinctly (fig. 4 and 5).

CONCLUSION
The survey we have just presented is bringing out interesting reflection cures for policy makers.

The most obvious is that posthumous school experience is a factor likely to influence opinions on theoretical knowledge and training and the very ability to recognize the interplay between theory and practice in the curriculum.

This is a rather important matter with plenty of social and economic overtones. Because of the hierarchical recruitment system and prolonged admissions to work in Italy, students who wish to become teachers often

undergo long training periods and will collect more than one qualification in the process. The student population registered for teaching qualifications, therefore, is less homogeneous (i.e. first-time freshmen) and more diverse, composed of students that are often studying a second degree, in most cases with teaching experience already gained in other school levels and, consequently, at an advanced age.

This should prompt teachers and policy makers to reflect on the type and mode of training provided and to improve the current education offer (Laneve, 2002).

Another reflection cue, less obvious and yet connected to the previous one, concerns the role played by the components of the curriculum at the end of the training of future teachers. It has emerged that student-teachers, especially those with years of experience, associate theoretical courses and direct training (fig. 8) to an intrinsic valuable dimension and vision of 'school doing'.

It is a dimension not always provided by university regulations and, in truth, nor by the actual research on teacher education (Damiano, 2007) but which, however, is shown by the sensitivity that students mature during years of school practice (fig. 8- it is significant how the frequency of class *knowledge*, *skills* and *values* is almost exactly like that of students with 6 years experience).

This figure could be interpreted as an appeal to all forms of responsible teacher training (teachers, supervisors, mentors, planners etc.) to engage in the direction of a *three-dimensional teaching*, properly *educational* and not just *informational* which could provide prospective teachers with knowledge, skills in as much with evaluation criteria that are essential to everyday school life.

201 - Implicit in Teaching: a Contribution to the Development of the Proficient Teaching

Loredana Perla[1], Viviana Vinci[2]

Department of Educational and Didactics Sciences, University of Bari, Italy
[1]l.perla@sc-formaz.uniba.it, [2] vivianavinci@yahoo.it

Abstract: The objective of the following research is to investigate the practices which contribute to the creation of the teacher-master identity. Mixed instruments were used: explicitation interviews, video-research, writing anecdotes. The results of the first step of collaborative inquiry revealed a rich repertoire of routines and some unexpressed levels of professional assumptions embedded in the development of expert teacher identity. Teaching practice is influenced by his/her biography, student's memory and relations with his/her past mentors, conceptions implied in the choice of a job, good-teacher-action indicators and ethical views about practice. The findings suggest that teaching practice is not based only on an evident kind of didactics, but it rather consists of acts, routines, aim-directed activities, gestures, memories, beliefs, which are not instantly decipherable, but that contribute – if explicitated and analyzed by teachers with the support of researchers – to the creation of the teacher-master identity and his/her expertise in teaching.

Keywords: implicit didactic, professional identity, proficient teaching development

INTRODUCTION

The objective of the present research is to investigate the ways, practices and routes which contribute to the creation of the teacher-master identity and his/her expertise in teaching. This expertise in research has been defined *magistralità* (excellent teaching practices).

There are two operational perspectives carried out in the present study: the analysis of teaching practice (Damiano, 2006; Laneve, 2005) and implicit didactics (Perla, 2010) with particular reference to the studies on the role of emotions in educational effectiveness (Perla, 2002; Day, 2009), to narrative inquiry (Connelly & Clandinin, 1985; Demetrio, 1998) to teachers' talking and walking (Mena Marcos & Tillema, 2006). The first stage of this collaborative research has been carried out - for two years - with 80 secondary school teachers from Apulia. Different techniques were used throughout this stage: explicitation interviews (Vermersch, 1994); video-research (Tochon, 2009), writing anecdotes (van Manen, 1991). Grounded theory (Strauss & Corbin, 1994) guides the data collection and analysis whose goal is to highlight some indicators of teaching excellence routines. It is worth noticing that the results of the first step of the enquiry revealed some unexpressed levels of professional assumptions and a rich repertoire of routines embedded in the development of expert teachers' identity.

RESEARCH OBJECTIVE

The research on "teachers' practical knowledge" (Elbaz, 1983) nowadays focuses its attention both on the noticeable and remarkable aspects of teaching practices and on those hidden and not obvious facets, which could be defined as "implicit didactics" (Perla, 2010). Implicit knowledge is seen as fundamental to all human cognition (Polanyi, 1962) and to knowledge management in particular (Nonaka & Takeuchi, 1995). It has been argued that a large portion of the knowledge required for executing organizational activities and processes is implicit (Lubit, 2001; Spender, 1996). According to these interpretations, teaching practice is not an engineering act, based only on an evident kind of didactics, but it rather consists of acts, routines, aim-directed activities, gestures, memories, beliefs, none of which are instantly decipherable.

The study of the implicit educational variables may help us understand the epistemology of the skilled teaching knowledge and the ways whereby this knowledge grows and evolves.

The main object of this study is, therefore, the identification of some indicators involved in the creation of teaching expertise, based on the assumption that the knowledge about "proper teaching" is not an exclusive property of academic researchers and that it is produced by the teacher himself/herself, perceived as an *active practitioner* and a maker of his/her personal vision of excellence in teaching.

Some underlying, basic questions at the base of the present study are here summarized:

a. What can teachers-experts (Loughran, 2010) – also defined teachers-masters – do (Perla, 2010)?
b. What are their memories, their beliefs, their passions?
c. What are the routines involved in their teaching methods (Vinci, 2010; Morgese, Vinci, 2010)?
d. Considering the explanation of these aspects, is it possible to identify some typical facets of teachers-experts' educational communication?
e. Is it possible, given these facets, to identify some criteria in order to corroborate and assess teachers-experts in the light of the principles indicated in the Italian *Nuova Formazione Insegnanti* (New Teacher Training).

This survey, which has been carried out in order to find useful answers, is only part of a broader research which aims at the analysis of the so called *underlying meanings of practical knowledge (impliciti del sapere del pratico [insegnante])* (Perla, 2010). Its basic hypothesis states that teachers-experts (we prefer another definition, *teachers-masters*) transmit their competence through unspoken knowledge and actions: these aspects have not been deeply examined in educational theories so far.

The objective of the present research is the identification of the features of excellent educational methods, starting from the analysis and the understanding of the underlying routines in practices[66], theorizing educational methods with a *bottom-up* approach instead of considering aprioristic modeling of virtuous processes, the latter deriving from paradigms found in classical pedagogical anthropology. Furthermore, this research aims at defining some standards or competence descriptors to the assessment of educational routines in the long run.

Its purposes are congruent with the continuing development of teacher accountability, innovation, collegiality and leadership throughout the career span.

This is basically due to two reasons.

The first reason deals with epistemological motivations: educational knowledge of virtuous teaching methods is fostered in order to identify some typical features which can be taken as reference points to the professional development of teachers and in order to establish training procedures for newcomers in this discipline.

The second reason deals with a more professional scenario concerning the meritocracy-driven development of Italian teachers' careers. Lately, the most enlightened governments (United States are at the top of this list) have included, in their political agenda, honours for virtuous educational methods as well as the selection of shared, public and open criteria which foster the activity of worthy teachers. Barack Obama, President of the United States, right after his election stated that there should not be any opposition in "rewarding excellent teachers with incentive pays […] We need to hire, train and reward the best teachers. The most important factor in the education of students is represented by the person they face in classrooms".

A broad number of virtuous teachers with more generous wages would represent a sort of driving force for the whole system and would result in the creation of new roles and functions which are essential to the educational structure (trainers, coordinators, etc.) (Oliva, 2010). Consistently with what President Obama states, we think that the identification and fostering of this *target group* play an important role in Italy, considering the partnership between primary and secondary schools and Universities that will take place as soon as the official Regulation of *Nuova Formazione Insegnanti* (New Teacher Training) comes into force. This issue is quite problematic if we consider places and actions carried out by this group of excellence: from tutoring and supervision activities at Universities to mentoring projects dealing with the *Tirocinio Formativo Attivo* (training period) in secondary schools which is due at the end of university studies, or the so called "middle management" which will become an important reference point within schools, thus boosting the relationship between the education system and its related territory.

This new vision of *virtuous practical knowledge,* together with a new awareness in the epistemology of excellent knowledge and a well-defined spread of this experience between teachers-masters and teachers to be trained represent important issues in the current field of education.

These are also the main objectives foreseen in the long run of the present research.

---

[66] The underlying routines in educational methods that I am referring to are made up of life memories, informal routines in classroom activities, simple epistemology, beliefs, emotional patterns, professional actions: this creates an unaware level of transpositional expertise which can transform the theoretical, scientific and epistemic knowledge in taught knowledge (learnt by students).

THEORETICAL FRAMEWORK AND DESIGN METHODOLOGY APPROACH

The present collaborative research has been carried out together with 80 teachers of *licei* in Apulia (Italy), chosen by students, co-workers and principals by means of three anonymous questionnaires. Students were asked to indicate the most stimulating and interesting disciplines; teachers were asked to indicate four names of co-workers who could act as reference points within the different departments in the *Liceo;* principals were asked to indicate four names of teachers who could be designated for trusted tasks. A cross-check methodology allowed the selection of 80 virtuous teachers chosen according to the preference of students and professional communities.

Eighteen *licei* (from different curricula) in the whole provincial administration of Bari were chosen.

The theoretical framework arises from phenomenology (Mortari, 2003; Perla, 2010) and generates its methodological outcome as a *theoretical* stance aiming at underlining that reality and material things refer to a series of "underlying" and "non-visible" ideas that can be understood only through active, "wide-eyed" openness (Stein, 1998). The three-step methodology chosen for the present research is defined as *esplicitazione* (explicit manifestation) (Perla, 2010), and it is structured as follows: a) the awareness of the teaching practice; b) the "teacher's talk"; c) the return to the teaching practice.

The heightened awareness is brought about by describing as objectively and thoroughly as possible what a teacher sees and remembers of his/her own acts, so that a kind of *snapshot* is obtained, which is to be as faithful as possible to the lived experience. The "teacher's talk" (the second step) aims at revealing the representations of the teaching task developed during a teacher's career. The forms in which this is accomplished have an expressive nature: the account of the classroom life, the narration of significant episodes, the recall of their personal and professional biography. The teaching practice cannot be theorized except by starting to narrate it. The cycle of explicitation closes by returning to practice: what emerges from the account is analyzed, deconstructed, explicited with the teachers themselves, who then "take it back" to the classroom (herein lies the sense of such a research, which is both collaborative and ameliorative) until the constituents of the teaching practical knowledge are identified, and the possible ameliorative effects in the classroom are revealed. The explicitation programme does not have a reflective function only, or that of the distancing of the practices[67] (Laneve, 2009, p. 44) by way of their analysis (Laneve, 2010); it also has a liberating and cathartic function. It helps alleviate the tensions which always underlie the relationship between personal identity and teaching identity (Berry, 2008): these two are not always in sync with the requirements of the professional context.

This method triggers a "circular" cognitive movement which is also reflective and heuristic, aiming at combining teachers' professional and private life. Its final goal is the utmost valorization the idea of teachers: this concept is too often underestimated in theoretical discussions about education systems. In this methodology teachers' thoughts become as essential as researchers' analyses in order to develop this kind of research. In this process teachers do not act as *sources* or *addressees* of scientific analyses on education, but they play an active, collaborative role in building up scientific discourses about teaching methods. As E. Damiano (2006) writes, this re-arrangement acts as a sort of *emancipation* of "pragmatic individuals" when compared to academic researchers: "teachers will not address researchers in order to know what they can think or know; vice versa, researchers will be asking teachers about their knowledge of educational methods. Researchers will take cognizance of this reversal of roles, as it is not an easy task" (p.31).

In the course of the research, three techniques are used:

   a. Hermeneutic-explanatory interview (Vermersch, 1994), so that excellent teaching beliefs and memories come out.
   b. An essay dealing with a worth mentioning school-life *episode*;
   c. Filming classroom activities using the so called *stimulated recall* technique with teachers, so that implicit routines concerning "explanations" during these activities come out.

Interviews and essay writing activity allowed the creation of a significant *corpus verbatim* which has been processed through Qda - *Qualitative data analysis* (Strauss & Corbin, 1998) encoding. The corpus has been segmented in shorter strings, then analyzed following a two-level approach. In the first method an *open code* analysis has been carried out (open encoding, meeting criteria such as fidelity and interpretation of "hidden features" within texts: this approach "opens" texts towards "cautious" (Pozzato, 2001) semiosis carried out by researchers who, throughout this stage, should suspend the related meanings he/she is likely to produce, even though this would result in a difficult task. Nevertheless, suspension of judgments (*epoché*) has to be considered a proper myth.

---

[67] "The analysis of aims at acquiring the knowledge about the performances and at formalizing the practical knowledge through the distancing of the practices".

In the second method texts are analyzed by *select code* technique (a progressively selective encoding, in order to unveil teachers' beliefs, knowledge, explanation of master educational methods: recurring meanings are gathered into macro-categories). In this selective encoding a grid of linguistic, emotional and ethical implicit meanings within texts has been created: this methodology was used in a previous research (see Table 1) (Perla, 2008) and allowed the identification of several *coding lists* concerning recurring implicit meanings within the general discourse.

Table 1: Grid of implicit meanings within texts

Indicators	Descriptors / Index terms
Implicit linguistic	Omissions Inaccuracies Incompleteness of the enunciation Assumptions Implications Incomplete sentences Lack of words Lack of specifications Lack of justification Lack of arguments Impersonal subjects Generic deictic expressions (for example: "I did what I could" without specifying what was actually done) Imposition of rules Generalizations Vagueness Hermeticism Convoluted thoughts
Implicit affective	Linguistic signs/indicators of emotions: altered forms of nouns (superlatives, diminutives, emphases, exclamations); Use of first person; References to emotional states (basic dominant tonalities); References to feelings (complex dominant tonalities) References to emotive situations, to critical incidents
Implicit political – ethical	Linguistic indicators of judgment: "has to, must, should"; Use right / wrong, positive / negative, good / bad Use of unjustified / unwarranted assertions Prescriptive enunciation References to professional ethics References ideological, political, ethical Prejudices, beliefs

A further analysis was carried out on the corpus of video footage. The surplus value arising from video-recorded footage (Goldman et al., 2009) is represented by the actual identification of precise elements in teachers' activity such as his/her voice, his/her non-verbal behaviour, his/her gaze direction. Furthermore, *stimulated recall* technique indicates that videos should be watched and commented by teachers first, then by researchers and finally by both of them together; this would result in the identification of typical elements that otherwise would not be recognized.

The video-analysis of lessons has been carried out according to a three-level scale: the first level is *macroscopic* and it analyzes a *macro-sequence* within a classroom (and its related class) considered as a whole and in the long run. A more detailed level follows: it is defined *mesoscopic* and it is used to fraction a discourse by analyzing a specific theme[68], that is conversational productions uttered by teachers and students[69]; in the final stage (*microscopic* level) *facettes*[70] are analyzed. This idea[71] was firstly introduced by

---

[68] A theme is a 10-minute conversational unit of the whole fragmented discourse, focusing on a specific topic usually made up of an introduction and concluding remarks and defined by *marked* actions and acts arising from the interaction among actors involved in it.

[69] The thematic analysis is the basic structure used to piece together what is taught; it is used in order to study the professional knowledge of a teacher. By observing a class one may reconstruct, after proposing an hypothesis, his/her knowledge starting from actual *actions* performed by the different actors within the class as well as the related *context*.

[70] *Facettes* are simple sentences grouped according different categories (conceptual, linguistic, procedural, etc.) used to study those interactions which practically define knowledge. As a result of the classification of transcribed material,

J. Ministrell (2001) and it indicates a simple sentence with its corresponding knowledge element detected by inference, starting from the actual context of utterance.

The methodology used in video analyses was the fractioning (*découpage*[72]) (Vinci & Damato, 2010) in different themes: this technique splits a scene in major sequences.

From the analysis of the corpus of video footage by means of *découpage* technique, some routines have been identified.

Here is a summary of the main steps involved:

- Accurate transcription of the material to be analyzed and, by means of observation grids, partition and sequence analysis of video footage. This operation is carried out by different researchers pertaining to different disciplinary areas with different tools;
- In the second step results of the different segments are compared, that is the sections individually selected by researchers, in order to find intersection points or recurring patterns in the different analyses; as they are the result of a multiple perspective, these points are to be considered the connections among a series of interpretations;
- The materials are finally gathered in a synopsis, a table or tree-model hierarchical representation of every element in the video sequence, also defined *macrostructure* (Dolz & Toulou, 2008).

A multi-perspective verification has assessed the quality of interpretation of the materials gathered for the analysis; the actors involved in this stage are researchers first, then teachers, and both categories together.

Here is a sample of the *coding lists* obtained from the analysis of spoken and written corpora.

As we returned texts to teachers, for every text string we included an additional "suggestion for explicitation": this was an expected procedure because we provided every string with an input, asking for an explanation of non-clear notions in the texts we collected. The result of this research carried out by teachers and researchers was the identification of several "typical elements" which became useful in order to outline two different typologies of master activities: implicit excellent teaching practices relating to knowledge and those relating to epistemology.

Table 2: *Coding list* samples from the corpus of interviews

Coding list Consigne de départ Interview	Text strings in interviews	Suggestions for explicitation	Identification of typical elements
4	"Frankly I could not explain the reason for this interview. It may be due to the to the lack of motivated teachers or to the crisis of the two fundamentals of excellent teaching practices: humanity and competence"	What are the reasons for the crisis of the teacher?	Search for auctoritas
26	"I really do not know what to say; though I think that talking about teaching today means to recover the true meaning of teaching".	What is the word for describing the teacher's educational functions?	Unconventionality of the teacher
Coding list First approach - interview	Text Strings	Suggestions for explicitation	Identification of typical elements
Coding list Consigne de départ Interview	Text strings in interviews	Suggestions for explicitation	Identification of typical elements

they are considered detailed analysis units on a microscopic scale, reflecting students' ideas which later become the starting point for didactics; nevertheless, they do not take into account the complexity of classes as well as educational methods.

[71] The French term *facette* comes from the English word *facet,* coined by Jim Minstrell in 1987 to designate small knowledge elements, ideas or thoughts inferred from research on students' ideas or comments made in class.

[72] *Découpage* is a French term (masculine singular: *le découpage*), but in this context (in the original Italian version) we decided to use the feminine article, thus *la découpage*, in order to designate a research methodology and to avoid any ambiguity with an artistic-decorative technique called *le découpage,* precisely.

Table 2: *Coding list* samples from the corpus of interviews (cont.)

4	"I had a teacher in primary school who had 61 pupils and we used to call him "panocchietta" (little cob), because he used to the use his stick against naughty pupils…. He was tall, sturdy, and had a scathing look…"	What are the memories associated with this teacher?	Physical appearance, gaze (non-verbal elements)
56	"My teacher taught a method more than contents. And the method is the search for truth. Instead of saying: this author said this or that author said that he would ask us, - what's your opinion? He used to stimulate our mind, our reasoning…"	What to you mean by teaching method? What are the things you have been taught that go "beyond the mere didactic method"?	Search for truth
Coding list Memories interview	Text strings	Suggestions for explicitation	Identification of typical elements
3	" I remember Ms Lamacchia, who showed me how to look at philosophy as a sort of inner digging and drilling. Her being consistent showed us how to enjoy the dignity of life, that is a life in the service of others. The sense of consistency and revelation".	What does being consistent and revealer mean to a teacher?	Raising the awareness of the students
35	"When my teacher read our homework, she used to block our exercise books with her left hand on the page, as with her right hand she marked mistakes in red. Her hands' nails were always tidy and red polished the same color as the mistakes, this may be the reason why I rarely use red polish, because I relate it with the mistake…"	What was the meaning of mistake correction and how was it experienced?	"Correction" as a way to grow up
23	Well, I do not remember very well, I think I have a lapse of memory. But I have good memories of some of my teachers in primary school (I had three teachers), mainly emotional memories. I believe that a teacher is someone who can love you, understand you, advise you, and orient you towards a certain way of behaving which is socially shared… I do not think I have ever had a figure like this, or maybe I have, but I really need to take it out of my blurred memory: it's my primary school teacher. I remember when I got her angry because I had ripped out some pages from the exercise book to write the same sentence again. It might sound as a foolish, meaningless episode, but it actually taught me that a mistake is a human thing, not to be condemned, and that it helps you grow up…"	Which strategies can be used to teach the positive side of making mistakes?	"Correction" as a way to grow up
Coding list Metaphors of excellent teaching practices	Text strings	Suggestions for explicitation	Identification of typical elements
3	"My teacher is a sower, a travel companion, able to step aside in order to give prominence to the pupils.	What does it mean to step aside in order to give prominence to the pupils?	Attitude of giving

Table 2: *Coding list* samples from the corpus of interviews (cont.)

Coding list Consigne de départ Interview	Text strings in interviews	Suggestions for explicitation	Identification of typical elements
<u>35</u>	"Unattainability, ideological commitment: I remember well a teacher who openly stated his ideology, Mr Amoruso.	What does Mr Amoruso "teach"?	Professional Engagement
<u>Coding list Memory-related writing</u>	Text strings	Suggestions for explicitation	Identification of typical elements
<u>3</u>	"The episode that better recalls an instance of excellent teaching practice is related to the memory of a teacher in ginnasio. This teacher strove against the Principal and the whole Teachers' Board so that we could be again part of the school magazine we had been expelled from, because of a foolish intemperance. S/He wanted us to be readmitted so bad, that he fought like a lion to persuade his/her colleagues. S/He eventually made it, and we realized how much s/he was interested in our personal growth, we felt appreciated". "In my teaching practice I pay a lot of attention to the method: since I teach literature, I think it is appropriate to start from literary criticism, because it is important that students know that there are many possible definitions of poetry. Before explaining humanism, I give a cultural background of the movement. Then I go into details, pushing my students to look for the truth in themselves".	How are worthy people encouraged? What does it mean to look for the truth?	Fostering talented people Search for truth

Table 3: Routine summary samples taken from the fractioning (*decoupage)* of a lesson

Action Routine	Verbal communication routine	Non-verbal communication routine
Supporting the student in the summary of the lesson	Anticipations	Eye contact
Supporting the students in the practice	Praising the students	Hand gesture
Examples Statement of the content of the lesson	Gratifications	Listening position: hand under the chin and nods
Hinting at the content of the upcoming lesson Operational tasks to students	Expressions used to get students' attention	Position in problematic moments: hard look, rigidity e static posture
Self-correction of mistakes Filing the class roll	Directiveness, decision-making	Position to ask for help or further explanation: half-shut eyes
Links to concrete actions Exercise-books check	Encouragements	Position to emphasize words: eyebrow raising
Interdisciplinary connections Comments to the students' answers	Scolding, berating	Position towards the students who contradict the teacher: rigidity, low eyebrow

CONCLUSION: Implicit excellent teaching practices: from the identification of typical elements to profile outlining

Here are the results of the present study.

From the analysis of the *corpus verbatim* some typical traits[73] dealing with two identity-related profiles of implicit excellent teaching practices have come out: *excellent teaching as life knowledge* and *epistemic excellent teaching*. The first profile, which includes distinct educational elements, is the most recurring one. The second profile, which includes teaching elements arising from the relationship between teachers and "material aspects" of knowledge are less frequent in the corpus. The term *Epistéme* (the combination of *epi* [on, upon] and *Histanai* [to set, place]) means "sense of balance": it is knowledge, cognition, science. Considering what they have written, it looks like teachers identified excellent practices as everyday and common knowledge or existential knowledge rather than cognitional knowledge: this knowledge is full of ethos, actual examples, affection. The analysis of routines has revealed epistemic excellent practices deeply connected to educational transmission (Chevallard, 1985).

The identification of typical elements, even though carried out on a considerable corpus (80 interviews, 40 essays, 40 episodes) cannot reveal generalized inference.

Nevertheless, the survey has generated an interesting path for those who search for efficient markers in teaching methods. In the future, the number of teachers involved in this survey should be bigger, and they should represent a bigger area and come from different institutions (next year primary school teachers should be included in the survey).

Here is a summarized sample of excellent teaching indicators which arose from the identification of typical elements:

Excellent teaching practices as knowledge through life experience

a) Excellent teaching practices and (personal) memories

In every *corpus verbatim* teachers refer to teachers who exerted significant influence on their personal experience. In first approach questions, that is those involving long-run memories (which reveal permanent and *silent* interpretations), *teachers* and *excellent teaching activities* refer to early school memories: 35 out of 80 teachers recall their primary school teacher (their first "institutional" teacher, namely). Memories act as a sort of "archive" of professional and personal identities: "As we have our own experience, I often recall some inner models my teachers taught me when I have to take decisions in class", a teacher revealed in the interview. The so called *imprinting* of excellent practices is to be found in early experiences with teachers. The "recall" of primary school teachers summons up informal, daily life episodes rather than educational methods: other elements such as affection, endearments, irony prevail.

b) *Excellent teaching practices and body-related activities*

Despite a widespread dualism between soul and psyche or body and spirit, every teacher makes reference to the physical appearance of a teacher as a way to convey codes but also to release emotions. Body-related elements are meant as *gestures* as in the case of the teacher's hand "writing on the exercise book", the idea of "tidy, red-polished nails" or "piercing, stern blue eyes". Teachers' physical appearance is a visible identity and represents the aesthetic dimension of excellent practices. The tacit content has dealt with body-related elements meant as professional and educational activities (their sequence and final aims). Actual actions and activities are hardly recalled, while teachers' posture is a vivid memory as it recalls the physical entity of the teacher within a classroom.

c) *Excellent teaching practices and narration*

This term comes from Latin *gnarus*, which means "expert". The most typical feature of recalled teachers deals with his/her ability in narration. A teacher-narrator is likely to be associated with terms such as "warm", "protective", "reassuring". The tacit content has dealt with the way in which this trait has come out, as we could not state if narrating activities were part of past experiences or an educational process.

---

[73] This technique (*tipizzazione* in Italian) comes from a term used in paleography to indicate highly formalized and standardized writings and its related elements. In the analysis I have carried out, this technique highlights the most typical elements in a written or transcribed (as in the present case) production. This stage comes before proper formalization, the latter being built on these typical elements and embedded in a personalism-related theoretical framework in which actions are seen as "acts" and "choices". For further references concerning personalism as act and choice see E. Mounier (1984).

d) *Excellent teaching practices and care*

Excellent practices have an "expert eye" because they deal with kind and caring activities. Teachers-masters take care of their students with panoptic gaze, thus gathering details in relationships or seemingly superfluous things, integrating this vision in an *overall, supportive, valuable and inclusive* perspective. This perspective deals with the relationship between a teacher and his/her students, with particular emphasis on what students arouse in teachers. The tacit content dealt with the ways one takes care of himself; teachers have recalled episodes in which their teachers took care of them, while episodes of professional care are less frequent.

e) *Excellent teaching practices and examples*

From the analysis of video footage many routines dealing with practical examples came out, that is acts performed by teachers which their students had to repeat. Examples imply imitation, aiming at reproducing the most outstanding elements of its reference model, thus conveying a process of consensus-based social reproduction which relies on emotional relationships; as in osmosis, this conveys some values to non-adults, attitudes, habits and behavioral methods which are typical of one's belonging group. Examples came out as a particular, informal educational method which is learnt without direct teaching processes (the latter being a very frequent element in the association of ideas between educational and efficient methods): a good teacher is someone who can pragmatically exemplify a general rule, showing up qualities within a group ("this is a good example of literary text"), or indicating behaviours to be imitated (following someone's example).

Excellent teaching practices as episteme

f) *Excellent teaching practices and learning*

A frequent association between teachers-masters and learning processes came out. A teacher is recalled as a "treasure chest full of knowledge"; he/she acts like a grandfather/grandmother "who knows everything about every building we looked at"; he is "a strict teacher who loved my writing style and my reading skill"; she is "a teacher who spoke Italian perfectly, without that typical regional inflection!". This deep knowledge is seen a fundamental element in excellent practices.

g) *Excellent teaching practices and communication*

Teachers-masters have a straightforward and ironical interaction, but this does not mean that they neglect objective contents. The analysis of the material we gathered highlighted how taught lessons are associated with questions, curiosity, discussing issues and encouraging students.

In conclusion, it is possible to say that this survey highlighted five issues which deserve a deeper examination:

1) Every teacher hardly succeeded in recalling the sequence of his/her professional activities. Recalling their primary school teachers was easier than indicating good professional teaching methods as they could not think over their professional activity. Excellent practices are an observable element in their memories but it is not confirmed in their actions.

2) There is an unexpected imbalance towards ethical-emotional educational activities rather than epistemic-transposition ones. There is a particular issue dealing with knowledge in teaching communication, as it relates to exposition and transmission rather than constructivist theories. *Lectio Magistri* becomes a privileged liaise, but there are few active methods.

3) Research could be useful in order to enhance teachers' activities: writing activities and returning the material we gathered allowed a process of observation and contemplation. This could be helpful as in *Licei* inner-digging activities are hardly carried out.

4) We do not have enough elements to state if excellent teaching elements could be used as official criteria for their identification: new markers for every criterion should be categorized, especially as far as video research is concerned.

APPENDIX
Explicitation-ermeneutic interview

Consigne de depart

This interview deals with two main areas: *teachers* and *excellent teaching practices.*
Can you imagine the reason why I have decided to interview you about these areas?

Section 1: First approach

What are the words you associate with the idea of *teachers*?
Do you remember the name of your first teacher (age: 0-11)?
Do you remember the name of your teacher (age: 12-23)?
Have you had teachers in your adulthood (age: 24-35)?
If you had to choose among the names you have mentioned, who would be the first teacher you would think of?
Is it a name you associate with primary or secondary school, Universities, non-educational organizations (parish churches, associations, etc.)?
Could you define what a teacher is?

Section 2: defining the identity of teachers

Who is a teacher, in your opinion?
(Primary school teachers only) Could you indicate, in your opinion, the most typical elements that qualify a primary school teacher?
(Secondary school or University teachers only) Could you indicate, in your opinion, the most typical elements that qualify a secondary school or University teacher?
Please indicate three adjectives you associate with the idea of teachers
Please indicate three metaphors you associate with the idea of teachers: a teacher is like…
Could you define the term *magistralità* (*excellent teaching practices*)?

Section 3: memories

Could you tell a relational episode about your teacher?
Could you tell an episode in which you felt like your teacher was teaching you *a lesson*?

Section 4: practices

What meaning(s) would you give to the term *magistralità* (*excellent teaching practices*)?
What are in your opinion the actions that qualify a virtuous teacher?
Did the teachers you have mentioned in the previous question have extra-curricular, social or cultural activities?

Section 5: Excellent teaching identity

Do you think you inherited something you identify in your personality from one of your teachers?
(Teachers on duty only) Is your teaching method similar to your teachers' approach?
(Retired teachers only) Was your teaching method similar to your teachers' approach?
Please choose the most appropriate definition that describes the identity you currently perceive: educator, teacher, education professional, intellectual, schoolmaster.

207 - Reform and Recontextualization of Policies: the Role of Supervisors in Brazilian Public Schools

Vânia Finholdt Leite[1], Maria Inês Marcondes[2], and Ana Cristina Prado de Oliveira[3]

Departamento de Educação, Pontifícia Universidade Católica do Rio de Janeiro- Brazil
[1]vfaleite@uol.com.br,[2] mim@puc-rio.br,[3] ana.prado.oliveira@hotmail.com

Abstract: In Brazil, since the 1990`s educational approaches have favored the definition of national minimal contents, of the length of learning span and of the implementation of evaluations aiming at better quality. This quality has been measured basically by the performance of the students, teacher and institutions. This culture of performativity (Ball, 2004) has, thus, initiated external evaluations and new patterns of management searching for competence and productivity, but, on the other hand, has fostered competition. In the team of management professionals of primary and high schools, the supervisor has been considered the main agent, the one who is responsible for keeping the teachers involved and committed with the fulfillment of performance goals established by external indicators. Therefore, the supervisor has the key role in the mediation between the Department of Education and the teachers. She/He carries out pedagogic tasks related to the professional development of teachers and is responsible for the political effort to implement the principles of the reform. In this paper we present part of the data collected through a research project which focused on the performance of two supervisors facing these changes, in an attempt to answer two questions: 1) What were the pedagogical and political meaning and objective of the supervisors´ performance relating to the teachers of these two schools? 2) How do the supervisors carry out the task of providing the teachers´ professional development in schools guided by external evaluations? In relation to the idea of professional growth, we must cite Marcelo (2009) who considers this notion both an individual and an collective process which happens throughout life. The same applies to the concept of performativity, understood by Ball (2001, 2002, 2004) as a method of regulating the performance of the people and the organizations which are then controlled by the results achieved by them. As regarding the methodological aspect of the study, a research was carried out in two schools (A and B) of primary education in the city of Rio de Janeiro, and data includes observation in these schools and interviews with the supervisors. School A is situated in an urban area, and the majority of the students´ parents attended high school whereas school B is situated in the outskirts of the city and most of the students´ parents are functionally illiterate. Both supervisors have been in this position for 15 years and do their work as part of their personal life project. In each school data was collected through participant observation during the teachers' meetings and class councils. The study has shown us indicators that in both schools the supervisors revealed that there is a recontextualization of the policies and that they are partially accepted by the teachers. The teachers are critical in relation to an effective improvement of the quality of teaching. In school A, the changes were accepted and seen as temporary policies. In school B, the changes are implemented provided they do not jeopardize the school pedagogical project, which involves reading and writing.

Keywords: supervisor, teacher qualification, performativity.

INTRODUCTION

Since the 1990s, educational proposals in Brazil have given priority to setting minimum national content, length of time spent learning and application of external evaluations aimed at improving quality. This quality has been measured basically through the performance of students, teachers and institutions. A number of authors have written about these new proposals.

These reforms have attributed a new profile and new roles to teachers, often disregarding the wisdom of these professionals. As Lee Shulman pointed out in a lecture entitled *Ensino, Formação de Professor e Reforma escolar* (Education, teacher training and school reform) presented in a seminar held in Brazil on the topic *Como anda a reforma da educação na América Latina?(How is the reform of education faring in Latin America?)*:

> As a member of the Union, I wish to assure you that teachers are not the enemy. Without teachers as allies, the dream of educational reform will be lost. (...) Reform must begin by respecting the wisdom

of professionals: we must take advantage of what our best teachers already know, understand and believe seriously, and build on these foundations. Any reform that does not see anything positive in what teachers already do is doomed to fail, because the teachers will be treated as enemies, rather than colleagues and allies (1997, p. 133).

The English teacher and researcher, John Elliot (1998), in his book "Curriculum as an experiment" argues that "there can be no development of the curriculum without the professional development of teachers as researchers in their own practices in schools and classrooms" (p. 17). In this book he makes a comparison between the reform processes in England in the Seventies and Nineties. He concludes that in the 1970s the teachers were invited to participate in the development and implementation process of the curriculum in a more democratic way and their opinions were heard and taken into account because the implementation was taking place through a process of action research.

The English researcher Stephen Ball (1977, 1994, 2001), analysing the continuous cycle of production and implementation of curriculum reforms, notes that these are not simply received and incorporated in the context of practice. This is a movement that involves relationships between different contexts and arenas of struggle which produce recontextualizations and reinterpretations. It is true that teachers are influenced by the discursive context in which the policy is produced, however, these do not have such unambiguous meanings and in its various fields of activity the interpretation of the text of the policy has clear links with the cultural and social relations of these spaces. Ball also reminds us that in the dynamic interaction between the different contexts of curricular reforms, there emerge, within this area of school life, in place of classrooms, a plurality of movements that express resistances, accommodations, subterfuge or conformism. Therefore, there is a reinterpretation of the reform by the teachers and even by the school management when it gets to the schools.

For the changes proposed by the reforms to occur in the school environment, Goodson (2008) notes that what is needed is balance and harmony between the internal issues, external relations and the personal perspectives of the teachers. This means being sensitive to the educational context and the personal missions of the teachers, because the changes only occur with an inner change in beliefs and personal plans. For Goodson (2008) it is the "personal involvement that underlies the teacher's sense of vocation and dedicated professionalism" (p. 108).

The author stresses that exactly the opposite occurs, the reforms "seem to insist that change will happen regardless of the personal beliefs and missions of the teaching body" (Goodson, 2008, p. 109). Therefore, some reforms are symbolic rather than substantive, since teachers disconnect their own search for identity from the proposals being implemented.

For Canário (1994), these reforms create a perverse effect that ultimately nullifies or counteracts the conditions that would be necessary to introduce the proposed changes, since they are imposed top down, belittling the practices that the teachers had been developing, and thereby aggravating their identity crisis and the teachers' *malaise*.

This change process has set up a performance culture (Ball, 2001, 2002, 2004, 2006) in schools, which begin to take on the "habitus of private production, with its commercial sensitivities and their utilitarian morality in educational practices" (Ball 2004, p. 1116) with new forms of discipline based on competition, efficiency and productivity. Education begins to be considered as "means of production and supply to meet market objectives of efficient transfer of quality control " (Boyles, 2000 p. 120 quoted by Ball, 2004, p. 1116).

The State begins to take charge of distance, decreasing the hierarchical structure of the system through the decentralization that is one of the strategies of disengagement of the State in relation to its social obligations toward the tip of the system, i.e. the school. The latter begins to have financial, administrative and pedagogical autonomy. A new form of management is established, focused on competition, efficiency and productivity. The school administrator's role is to encourage an attitude and a culture in which the teacher feels responsible and at the same time committed to the organization, i.e. he or she commits to the goals that the school needs to achieve in a given period. According to Ball (2006), "administrators become leaders more than controllers, providing the visions and inspirations that generate a collective commitment from the corporate group to be ' the best '"(p. 13).

THE PEDAGOGICAL COORDINATOR: POLICY MEDIATOR

In Brazil, in the management of elementary and middle schools, the pedagogical coordinator has been seen as a central figure, responsible for keeping the teachers involved and committed to meeting performance goals set by external indicators. Thus, the *Coordinator* is a key figure in mediating between the Board of Education and the school teachers, developing pedagogical functions related to the professional development

of faculty and a political function involving the implementation of the principles of educational reform proposed by the political administration at the time. In this context it is his or her job to motivate teachers to meet the externally specified requirements and objectives. Often, professionals in schools have to rethink their beliefs about what to teach, how to teach and how they relate to children, in order to play the game. This causes an atmosphere of instability due to constantly changing requirements and the ratings between schools, according to the new educational reforms. Coordinators and teachers have a new benchmark for their work, in addition to their own concepts and theories about it: they begin to work based on numbers and figures, performance indicators, comparisons and competition. Thus the ability and attributes of "being" a coordinator or teacher change. Teachers are often unable to identify with their practice in the classroom, because the most important thing is how to achieve specific externally imposed goals, even though it means ceasing to establish ties with the children with whom they work. While as coordinators they must primarily exercise the role of controllers and regulators of teachers' work.

In this context, we ask: 1) what is the meaning and educational and political purpose of the activities of the coordinator vis-a-vis teachers in two (2) schools in the pursuit of quality education? 2) How do coordinators work to help in the professional development of teachers in schools driven by external evaluations?

RESEARCH DESIGN

The research that gave rise to this work sought to examine the adaptations in the school context, after the deployment of a new educational reform in a particular socio-political context. The current management of the Municipal Secretary of Education of Rio de Janeiro proposed an educational reform that includes strategies that are inextricably linked to the curriculum and teaching practices of Elementary Education, which means new pedagogical guidelines, schedules of bi-monthly activities for each grade, and in each curricular component a list of descriptors, defining the skills to be evaluated in each two month period and unified bi-monthly reviews for the entire network in the Portuguese Language, Mathematics and Science.

In addition to these strategies, the external evaluations have brought new parameters in recent years for the teaching profession. By external evaluation we are referring to Prova Rio and Prova Brazil, instruments drawn up by professionals from UnB, as ordered by the City Hall of Rio de Janeiro and the Ministry of Education, respectively. The first was established by the Municipal Secretary of Education as an instrument for measurement and preparation for the second, which at the national level, is part of the total schools result in the IDEB (Index of Development of Basic Education). The results in the IDEB classify schools, indicating those which need greater financial or pedagogical support. In the case of Municipal schools network in Rio de Janeiro, students are evaluated based on two of the instruments and the results are disseminated, setting the basis for the average that must be achieved at the forthcoming evaluation and indicating those schools that should be rewarded for having exceeded their goals.

In the context of the changes that would be needed in the routine of schools based on these proposals, we observed the work of the coordinators, to reflect on the issues raised above.

The first aspect to be clarified regards the fact that in the city of Rio de Janeiro, in order to act as a coordinator, you do not need to be a specialist. The position of pedagogical coordinator "can be exercised by any teacher with more than five years of experience, nominated by the school Director with the approval of the Regional Office of Education" (Oliveira, 2009, p. 30). Resolution SME no. 1074, of 15/04/2010, issued by the Secretary of Education defines the role of Coordinator as being responsible for organizing the process of planning, monitoring and revision of educational action in conjunction with the Director and teachers, aiming at the improvement of the teaching and learning process. For the Secretary "an educational system has quality when its students learn and pass the year, when it serves all the children and young people" (Klein, 2006, p. 140).

The data in this work are based on *participant observation* during the Study Centres and Class Councils (CE's and COC's), as well as in semi-structured interviews with coordinators of two schools (School A and School B) for entry grades at an elementary school in Rio de Janeiro. In schools in the Municipal education network in Rio de Janeiro, the Study Centres (CE's) are fortnightly meetings held on Wednesdays for two hours, involving the pedagogical Coordinators and teachers. These meetings are envisaged in the timetable drawn up by the Secretary of Education for planning activities, evaluation of schoolwork and continued training of teachers. It is the Coordinator's role to discuss "with the teachers actions that will be carried out with a view to improving the performance of the students" (Bomeny, 2009).

The Class Councils (COC's) are bi-monthly meetings lasting for four hours, in which teachers, the Coordinator and school management come together to assess student learning and possible interventions to improve that process. The Municipal School Network in Rio de Janeiro proposes continuous assessment, with the register as a basic instrument, grades for externally prepared tests and a global grade (marks from

the tests and student development). The COC's for School A take place solely between teachers, management and coordinators, while in school B, class representatives are invited to present to the teachers negative and positive points and suggestions for improvement of the school.

School A is located in the urban area and the parents of the students have mostly completed middle school. This school caters to 571 students from Nursery to Elementary, mostly coming from the community of Ladeira dos Tabajaras (a "favela" – slum – in the South zone of Rio de Janeiro) and environs, or whose parents work in the homes of the upper middle class residences of the neighborhood where the school is located. In a piece of research conducted by the school management for the re-structuring of its Pedagogical Political Project, it was discovered that the families served by the school use the beach and the surrounding squares as their main leisure activity and mostly have a home computer with Internet access. The teachers often complain of lack of interest by families in their children's school issues, but generally the parents accompany the performance of the students and understand that educational attainment offers the prospect of a more promising future for their children. Situated in a privileged location and having obtained good results in recent external reviews, School A is an important educational reference in the region, but it is not the only one. There exists between the professionals who work there a strong sense of responsibility for maintaining this status won by the school.

School B is located in the urban periphery and the parents of the students are mostly functional illiterates. This school caters to 170 students in the Nursery and 467 students in the Elementary section; much of the community served is situated around a former hospital for the mentally ill and squats. The residences are small, lacking basic sanitation and pavements. The surrounding population is composed of low-income blacks and mulattoes working in the informal and temporary markets. One can clearly see the lack of access to consumer and cultural goods, the poor prospects for the students for the future, due to lack of encouragement on the part of those responsible for studies as a way of progress and access to a better quality of life. School B is as an important reference for this community.

School B was the winner of a contest with a project planned by the Coordinator and the Reading Room teacher, based on their shared concept of reading, and this became a reference for all the work of the school. The external recognition of this work was in line with the desire of its professionals to build a stronger image academically, erasing the stigma created by the origins and location of the school (former a Centre for the mentally handicapped) and by recent excellent results obtained in external evaluations.

Despite structural and contextual differences in the schools examined, both coordinators work in an Elementary school and have approximately 10 years in this role, which is part of their personal life project.

THE FINDINGS

The initial issues raised for our study were: 1) what is the meaning and educational and political purpose of the activities of the coordinator vis-a-vis teachers in two schools in the pursuit of quality education? 2) How do coordinators work to help in the professional development of teachers in schools driven by external evaluations?

In the analysis of data collected in meetings (CE and COC) in relation to the objectives of the study we focused initially on the issues discussed, the dynamics of the meetings and the work of the coordinators. Based on careful reading of our observation reports and the data obtained in semi-structured interviews with coordinators the following points emerged: the vision of what is a quality school, the importance of interpersonal relationships, the primary concerns, problems and challenges faced and the influence exerted by external evaluations on the progress of work of the coordinators and teachers.

What is a quality school?

The meaning and the educational and political purpose of the work of the coordinators is connected to the striving for the "quality school". First, we must understand that the ideas on "quality education", which the coordinators of Schools A and B believe in, have their differences in their pedagogical beliefs and experiences of schol reality. In School A, the teaching team, guided by the Coordinator, believes that it will achieve an effective "quality education" if it exceeds the targets set by the Municipal Secretary of Education in the external evaluations, and also meet the expectations of teachers about what students should learn in that grade, and which, in terms of objectives and content, "is broader" than the educational proposal of the policy in force. And, for this coordinator, "quality education", translated into "effective learning by his or her pupils, also involves investing in personal and social development".

At School B, "quality education" as pursued by the coordination team and the teachers translates into the search to achieve the goals set by the Municipal Secretary of Education in external evaluations, which has not yet been reached, "without losing sight of the main project of the school with a focus on training of readers".

The Coordinator of this school understands that, to "achieve the desired quality of teaching, we must also invest in the cultural repertoire of the families of our students. "

Thus understanding what is really a quality school is differentiated and this can be verified by the observation data of the work of the coordinators in the two schools in the research carried out.

The role of the Coordinator in the professional development of teachers: emphasis on interpersonal relationships

Analyzing the work of the coordinators of the two schools, based on observation and interviews carried out, we note that both believe that "interpersonal relationships are central to the work of coordination of teachers".

In School A, the pedagogical coordinator can count on the ongoing support of the assistant director, who seems to identify more with the pedagogical and relationship issues than with school bureaucracy. They appear to be in tune with their guidance and in explaining the work to the teachers. Relations are based on personal knowledge, since both have been in the school long enough to know details of the personal lives of the staff (teachers, mostly with long careers at the school). As the Coordinator served as a teacher in the same group, the *a priori* colleague relationship facilitates communication with the teachers. It is clear that the coordinator seeks to develop the necessary power of persuasion for the group to rethink some practices, especially when it comes to methodologies and student results, but also demonstrates confidence in the teachers, giving them the autonomy to work in the classroom.

The Coordinator of School B seeks to strengthen the interpersonal relationships between teachers and technical and administrative staff through her work. This is evident in the care taken in organizing collective snacks before the CE and the COC. The gathering around the table is "the moment of meeting, relaxing, laughter and letting off steam among teachers, the coordination group and management". We also see this attitude during meetings in which interest is clearly shown in listening to the opinions of teachers, accepting a share of responsibility for the problems faced. Coordinator B gives a self-assessment of her work, admitting to the group, for example, that "this year I haven't had the opportunity to give you much guidance" (Coordinator B, field notes). Through these actions, she shows skill in developing good relationships which is the basis of her work as pedagogical Coordinator of the school.

With respect to the structure of the meetings of the CE and COC, in both schools they always begin with the reading of a poem or short story, followed by a free demonstration of the feelings raised by the text. At School A the text is selected by the Reading Room teacher, who leads this reading and discussion activity. The Coordinator does not find out what the text is until that moment, but actively participates in the discussion. While at school B, the Coordinator is the one who selects the text to be shared, from her personal repertoire or based on her aims for the meeting. Her choice is always imbued with meanings and aims to "touch" the group. This is evident in the testimony of the teachers during the meeting:

> *"I used to read on one subject. With this I started reading other subjects. But only for learning. Now I have started reading for fun..."*P1
> *"The Coordinator brought a poem by Cecília Meirelles. I identified with it. I found it very interesting!"* P2
> *"Behind all the subtlety and fragility of a poem there is a force able to discover it"* P 3
> (field notes, School B)

Thus, one can see that the strategies used by this coordinator to share with teachers the texts that she likes, appreciates and is moved by, are more of an educational than theoretical discussion about the pleasure of reading because reading without asking anything in return is simply a desire to socialize readings "with" the teachers, without obligation to respond or tell the central theme and this is how commitment to the *school's educational project* is expressed.

How meetings are arranged – themes and requests

The organization of these meetings is the responsibility of the coordinators. In School A, the subjects of the CE are defined according to the demands as perceived by the Coordinator and Deputy Director and with the demands raised by the Municipal Secretary of Education. The Coordinator presents and hands to each one present the agenda and topics to be addressed at the beginning of every CE. She attempts, during the meeting, to ensure that she acknowledges everyone. She often deals with the functional issues initially (dates, periods, events...) and theoretical training aspects are dealt with at the end of the meeting. In this school there is a partnership with an institution which assists the school by funding some demands that

cannot be covered by money from the Municipal Secretary of Education. One of these situations is the hiring of professionals for giving lectures or workshops for teachers on topics such as "ADD syndrome" or "the use of concrete materials in mathematical lessons". It is the function of Coordinator to realize the demands of her group of teachers and coordinate with the partner institution the themes to be addressed in addition to the organization and guidance of the format of these orientation meetings.

At School B, the Coordinator uses an activity strategy for discussion of the topics of the meeting. She argues that this "feeds the subject's needs as a human being" and that from the proposed activity pedagogical issues can be reached, such as: lack of discipline, evaluations, the significance of teaching and forming readers. The choice of themes aims to provide teachers with a basis for reflecting on some themes, such as: "giving a class is no guarantee of teaching", "blame the family for the failure and indiscipline in school" and "learning to read and write goes beyond decoding".

Problems and challenges faced by teachers and school management team

At School A the teachers and Coordinator share the same view on the biggest challenges of their work: "the external intervention of the proposals of the Municipal Secretary of Education and minimal commitment of families with the academic issues of their children". However, the reaction to these challenges differs between the Coordinator (and Deputy Director) and some of the teachers. While the first deal with the challenges proactively, without constant complaints or inertia in their work, some teachers say the challenges impede their work and thus justify all the difficulties with their students. During the CE and COC, the Coordinator displays or reproduces the demands concerning the dates or arrangements related to the policies of the Municipal Secretary of Education or external assessments neutrally, without judgment or criticism, but clarifying that the current demand must be fulfilled. She demonstrates in this way *an acceptance of the standards laid down*, whilst at the same time recognizing that *the work of the school goes beyond these goals.*

The *problems* faced by School B are identified differently by teachers and the Coordinator. For the teachers, the school's biggest problem is the indiscipline, lack of commitment by students and parents to their studies and personal care. During the meetings, Coordinator B proposes that the teachers reflect on their relationship with the students and the significance of this behavior. She questions whether they are like this due to the difficulties in the learning process, whether they are very authoritarian and if they guarantee enough space for student participation in conflict resolution. In addition, the Coordinator B gives examples of ways to work with the "students", for example, talking quietly to the child, surprising them in the way they are reprimanded. Although the Coordinator pays attention and suggests actions with children considered to be undisciplined, for her the focus of discussions should be about a reflection on interventions to make students learn the alphabet through texts, because she identifies a traditional teaching practice of reading to focus on decoding the correspondence between letter and sound to decipher words automatically and thus understand reading.

This dichotomy in the conception of language teaching instigates Coordinator B to invest in her own training, making use of courses offered in the community, but also inviting educators to discuss the process of literacy and acquisition of the alphabet, thus contributing to the training of the teachers. Another recurring action of Coordinator B is her struggle in favour of the inclusion of children with special needs, proposing activities with these students and discussing the issue in meetings.

In School A we also note a discrepancy between the conception of teaching advocated by the Coordinator and some of the teachers, especially the older ones. It is clearly the desire of the Coordinator (supported by the Associate Director) that the teachers develop "more reflective and constructive activities with their students." She demonstrates this desire through positive comments about the less traditional practices of some teachers or suggestions based on her experience of the classroom. However, as the students' learning results are satisfactory, she does not argue when some teachers justify their teaching habits with lines like *"I have always taught this way and it worked, I won't change now because of a fad ..."*

FINAL THOUGHTS: THE COORDINATORS, THE PROFESSIONAL DEVELOPMENT OF TEACHERS AND EXTERNAL EVALUATIONS

The study gave us indicators that in two schools there is a recontextualization of policies with partial acceptance of them by some of the teachers, however, teachers are critical of the effective improvement of "quality education". At School A the changes are met, incorporated into the teaching practice and seen as temporary policies. At School B changes are met as long as they do not compromise the educational project of the school which involves reading and writing.

The understanding of the external evaluation that the schools are subject to reflects this recontextualization of policies in the school context, and differs between them.

In School A, the assessments are included as part of the educational process and are not sufficient to assess the learning of their students. Thus, the teachers incorporate the materials and preparation for evaluations into their routine, but they do not stop carrying out activities and assessments which they believe in. The coordinator supports this practice since she also considers that the external evaluations, being multiple-choice, do not evaluate the basic skills of the students, such as the production of text, for example.

In this context of recontextualization of an educational purpose, we note an acceptance and commitment to the strategy, also because teachers feel they are being evaluated by the instruments and its results. However, the external evaluations are not the sole focus of the work. The role of Coordinator in observed situations has always been to keep this concept clear, ensuring the commitment of teachers in preparing their students for the exams and encouraging them to develop teaching strategies and evaluation techniques with a much wider scope than that offered by the instruments received.

The focus of discussions at school B is on "forming the reader", on the formative evaluation, observation instruments, diagnostics and records that help the teacher make interventions more finely tuned to the needs of students. This does not mean that the Coordinator disregards external test results. These are analyzed with the teachers who cannot be held responsible for the sluggish performance of the school, which for the Education Department was insufficient. To the Coordinator these results do not reflect the commitment and involvement of the team. "*We don't have a normal job".*

In both schools the external evaluations have brought new concerns and demands for the coordinators, who in addition to the deadlines and results thereof have to worry about the good progress of their group of teachers, ensuring harmony in teamwork.

In school, this concern involves ensuring a sense of team, a desire to overcome difficulties and the self-confidence achieved by previous results and the recognition of the external public. The instructions of the Coordinator, supported constantly by the management of the school, are clear and non-critical, and seek to avoid developing any sense of competitiveness between teachers, although some evidence of external competition (comparison with results from other schools) is noted in some meetings.

At School B, despite the reform creating a performance culture, some teachers and the coordinator take care to maintain good relations, whilst not forgetting the day-to-day relationships in school, saying Good day, giving the right look, talking to others: "Revisit our group relations. We are a group that can handle whatever may come. I really want this! " (Coordinator B, school meeting)

In neither school is there support for the belief that the external evaluations will ensure the improvement of the quality of teaching. The new policies are *recontextualized* and basically aim *to regulate the pedagogical process without a real transformation of the learning process and the situation of failure at school of many students.*

However, if on the one hand the reform in education creates a performance culture, on the other teachers and coordinators in their relationships in schools, when implementing the proposal, adapt according to their educational and social project.

A study by Day and others (2005) with teachers from Australia and England showed that teachers should be helped in relation to enthusiasm and commitment to their work as this is closely connected to their professional development. The Coordinator's role is key in this process. Another important aspect highlighted is the development of a collaborative culture and development of a reflective process between teachers that enables them to participate in school decisions and maintain their level of satisfaction in their work in the classroom.

FINAL CONSIDERATIONS

Through the analysis of our empirical data we reinforce the importance of the educational and political role of the pedagogical coordinator in schools. Regarding his or her educational role, research shows that the identity of teachers and the culture of schools should be taken into account when considering policies that will end up changing aspects of the teacher's daily practice. This fact is confirmed by the findings of the study of Flores and Day (2006). Professional identities take time to be built and are based on aspects of teachers' initial training and socialization experiences in the field of work. According to Ball (1994) policies are recontextualized and in this process, teachers are actors.

The teachers' meetings, the so-called Study Centres (CE's), are important forums of exchange between teachers, coordinators and management. Schools, like the ones in this study, in which the coordinators can maintain collaborative cultures, processes of reflective practice and shared decisions, are more likely to retain the commitment of teachers to student learning. This confirms the findings of Day and others (2005).

In these schools the work of the coordinators plays an important political role because the commitment of the teachers to student learning has a direct impact on the quality of teaching.

As regards the discussion and implementation of new policies the data shows that it is important to maintain an environment of exchange of experiences. Teachers cannot be seen as mere executors of reform but as actors who contribute in recontextualising the processes of change in practices and in this political process the importance of the Coordinator as the main mediator between the proposals of the Education Department and schools in the network is re-affirmed.

External evaluations are being partially accepted by the coordinators and teachers of the schools surveyed. Such acceptance is because they are regarded as provisional, temporary transformations and as long as they do not compromise the political pedagogical projects of the schools they can be accepted. These external evaluations are seen by coordinators and teachers primarily as new ways of regulating the teaching profession and not as factors that can contribute directly to improving the quality of teaching in schools. The reform should not have as a priority goal the improvement of statistical indexes. Teachers are more convinced by aspects related to social justice and forming part of their professional identity and mission to teach, as expressed by their commitment to student learning (Hubermann, 1992; Nóvoa, 1992; Goodson, 2007, 2008) than with external rewards and incentives that might lead to competition between schools.

As incentives for improvement of teaching, the schedule of reforms should include better working conditions and wages for teachers in general (Marcondes & Tura, 2006; Zeichner, 2008).

208 - Relating Self-study to Life History: A New Approach to the Study of Teaching Practices

Maria Inês Marcondes

Departamento de Educação, Pontifícia Universidade Católica do Rio de Janeiro, Brazil
mim@puc-rio.br

Abstract: My aim is to establish relations between self study (with a commitment to social justice) and life history methodology (as proposed by Ivor Goodson) in order to discuss the study of teacher education practices, emphasizing points of contact and similarities between these methodologies. I intend to develop a theoretical analysis of key features of self study and life history methodologies in order to propose a new approach to the study of teaching practices. The starting point of this paper is an interview with Professor Ivor Goodson (2007) about the possibilities of relating his proposal of life history with self study in order to develop a method of analysis emphasizing how the way teachers understand their own experience and the context in which they work contribute decisively to the transformation of this context and to a more critical approach to their own practice. This may lead to a stronger commitment to social justice in teacher education. This work tries to articulate these two methodologies that can be employed in the study of teachers' practices contributing towards the professional development of teachers. This was done through the identification of a number of categories found in both methodologies. In this theoretical analysis I shall explore the following central categories: *self* and *reflexivity; context, transformation/commitment to social justice;* and *collaboration*. I shall explore these categories using educational literature relating to both methodologies. In life-history the teacher's life should be the main focus, the starting point for the study of practice, since it seems 'less threatening', according to Goodson. In self study we start from practice and arrive at the study of self since it is not possible to study the practice without understanding the self, as practice is embedded in self. The discussion of the categories examined shows that both methodologies have essentially the same aim and that in combining them we can further elucidate our object of analysis and enrich our proposal in transforming teachers' practices.

INTRODUCTION

My aim is to establish relations between self study (with a commitment to social justice) and life history methodology (as proposed by Ivor Goodson) in order to discuss the study of teacher education practices, emphasizing points of contact and similarities between these methodologies.

THEORETICAL FRAMEWORK

I intend to develop a theoretical analysis of key features of self study and life history methodologies in order to propose a new approach to the study of teaching practices.

The starting point of this paper is an interview with Professor Ivor Goodson (2007) about the possibilities of relating his proposal of life history with self study in order to develop a method of analysis emphasizing how the way teachers understand their own experience and the context in which they work contribute decisively to the transformation of this context and to a more critical approach to their own practice. This may lead to a stronger commitment to social justice in teacher education.

According to Goodson,

> *I see many parallels between self-study and study of teachers' lives. But perhaps the most cogent parallel is that to do with reflexivity. As I understand it self-study is considerably concerned with reflexivity and the capacity to reflect on one's self and one's actions. This is precisely the objective in studying teachers' lives, particularly in studies where the researchers collaborate with teachers about their life study. So much of the work on teachers' lives turns on the relationship between the researcher and the teacher. In my view both of these parties are researchers of the teacher's world and it is important that the external researcher and the teacher researcher work collaboratively to reflect their own reflexivity in theorizing about the teacher's life world.* (Interview, 2007)

In this theoretical analysis I shall explore the following central categories: *self* and *reflexivity; context, transformation/commitment to social justice;* and *collaboration*. I shall explore these categories using educational literature referred to both methodologies.

ANALYSIS
The first category is: **self** and **reflexivity.**
Goodson maintains that,

> *We need to broaden and deepen the conception of self away from a singular, unitary, linear notion of narrative of self towards a multiple and more fluid notion of self.*
> *The focus in this work is on the reflexive project of selves which meant to refer to the multi faceted aspect of the project.(...) the self has multiple facets and prospects.* (Goodson, Interview, 2007)

In the 1980s Goodson was developing an explicit argument for the use of life history methods in studying teachers. Writing in 1981, he argued that researchers had not confronted the complexity of the schoolteacher as an active agent in making his/her own history; many of them still treated teachers as interchangeable types unchanged by circumstance or time (Goodson, 1981). As a result, new research methods were needed.
Hamilton and Pinnegar (1998), in their discussion of self study methodology ask precisely, what is self-study?

> *Defining it as the study of one's self, one's actions, one's ideas (...). It is autobiographical, historical, cultural and political and it draws on one's life but it is more than that. Self-study also involves a thoughtful look at texts read, experiences had, people known, and ideas considered. These are investigated for their connections with and relationships to practice as a teacher educator.* (p.236)

According to this view, *self* has been defined in many ways which are not incompatible, but rather can be articulated to take into account the diversity of experience.

The second category is: **context.**
Context plays an essential role in both these methodologies, since the analysis and discussion of the teacher's experience has to be centrally related to its social context, as the background against which it must be interpreted.

> *A great deal of work has been done about teachers' stories and teachers' narratives and these do not place the teacher's work and the teacher's life world within a historical perspective. What this means is that stories can be told as timeless stories about teacher's life and teacher's work. They therefore miss out the substantial degree to which the teacher's life and work is politically and socially constructed in different ways at different times in history.* (Goodson, Interview, 2007)

Both life-history and self-study use the work of Wright Mills (1959) as a central reference in order to link biography to history, "personal troubles" to "public issues".
Goodson, points this out, "The life history approach has the potential to make a far-reaching contribution to the perennial problem of understanding the links between 'personal troubles' and 'public issues', a task which, as C.Wright Mills (1959) pointed out many years ago, is the essence of the sociological enterprise." (Goodson, 1995, p.90) Thus, the life historian must constantly broaden the concern with the personal truth to take account of wider socio-historical concerns… *(*Goodson, 1995, p.80) The fully researched life history should then allow us to view the intersection of the life history of men with the history of society, thereby enabling us to understand better the choices, contingencies and options open to the individual.
Bullough and Pinnegar (2001) in their discussion of self study methodology also emphasize the importance of Wright Mills (1959). As Mills warns, articulation of the personal trouble or issue never becomes research until it is connected through evidence and analysis to the issues and troubles of a time and place. Biography and history must be joined not only in social science but also in self-study research.

> *When biography and history are joined, when the issue confronted by the self is shown to have relationship to and bearing on the context and ethos of a time, then self-study moves to research. It is the balance between the way in which private experience can provide impact and solution to public*

issues and troubles and the way in which public theory can provide insight and solution for private trial that forms the nexus of self-study and simultaneously presents the central challenge to those who work in this emerging area.(2001, p.14)

The third category is: **transformation/commitment to social justice.**
In both self study and life history we find a commitment to contributing in a critical sense towards social justice. This may be seen as a consequence of the relation between self and context leading therefore to a critical perspective.
Critical research can be understood as aiming to the interpretation of the issues analyzed in relation to the broader social system of which they are part with the objective of achieving a deeper and more complete understanding of its determinations, making explicit the systems of domination, oppression and ideology in order to lead towards a transformation of this situation of inequality. Thus, researchers adopting this perspective try to develop their work as contributing to those groups of people who are marginalized and oppressed in their struggle for the transformation of these political and social contexts.
For Goodson (based on Giroux concept's of 'transformative intellectual', 1988) planning the conception of self as intellectual plays a crucial role in the reflexive project of self building.

> *The material conditions under which teachers work constitutes the basis for either delimiting or empowering their practices as intellectuals will need to reconsider and, possibly, transform the fundamental nature of the conditions under which they work. ...more specifically, in order to function as intellectuals, teachers must create the ideology and structural conditions necessary for them to write, research, and work with each other in producing curricula and sharing power. In the final analysis, teachers need to develop a discourse and set of assumptions that allow them to function more specifically as transformative intellectuals.* (Giroux, 1998, p.xxiv)

In relation to commitment to social justice we use the self-study research of Shulte (2002):

> *My goal as a teacher educator has been to prepare teachers with the attitudes and skills necessary to reflect on their practice in a way that will increase their effectiveness with a diverse student population, particularly if they have had little experience with diverse classrooms. Critical reflection contributes to the transformation of prospective teachers' thinking about cultural diversity by helping them to develop a conscious knowledge of "the influence of culture on the way we personally make sense of and respond to the physical, social, and spiritual world" (Hollins, 1967, p.102). my study reflects this social-reconstructionist tradition.* (Shulte, 2002, p.31)

The fourth category is: **collaboration.**
Collaboration is a main aspect of both self-study and life history.

In Goodson's view:

> *So much of the work on teachers' lives turns on the relationship between the researcher and the teacher. In my view both of these parties are researchers of the teacher's world and it is important that the external researcher and the teacher researcher work collaboratively to reflect their own reflexivity in theorizing about the teacher's life world.* (Goodson, Interview, 2007)
> *…the interview is passive in that first period where they're eliciting that prime narration, the first narration, a kind of script of life, but then there would be some more stages which I describe as collaboration and location where you would ask a series of questions about that first narration of the life story which seemed to locate it, challenge it and interrogate it and position it, sociologically and historically.* (Goodson, website:Holding on together: conversations with Barry)

What kind of collaboration is important in studying teachers' stories? Genuine collaboration in studying teachers' stories is a viable "trading point" between life story giver and researcher taker, according to Goodson. Much of the work that is emerging on teachers' lives throws up structural insights which locate the teacher's life within the deep structure and embedded environment of schooling. This provides a prime "trading point" for the external researcher.

The role of the 'critical friend' in self study methodology is relevant for the understanding of how collaboration can be achieved. Self-study research, in an ironic counter to its name, often requires collaboration. 'Critical friends' represents a central concept of such work.

Loughran and Northfield (1998), for instance, say that, even though the term 'self-study' suggests an individual approach, we believe that effective self-study requires a commitment to checking data and interpretations with others. According to them, colleagues are likely to frame an experience in ways not thought of by the person carrying out the self-study. Although the importance of collaboration may seem to contradict the personal nature of self-study, it is essential for checking that focus, data collection and interpretations do not become self-justifications and rationalizations of experience. Collaboration provides some confidence that experiences and interpretations can be offered more widely for consideration by others, an important aspect of any study(pp.12-16).

FINAL CONSIDERATIONS

This work tries to articulate two methodologies that can be employed in the study of teachers' practices contributing towards the professional development of teachers. This was done through the identification of a number of categories found in both methodologies.

> *The pursuit of personal and biographical data might rapidly challenge the assumption of interchangeability. Likewise, by tracing the teacher's life as it evolved over time- throughout the teacher's career and through several generations- the assumptions of timelessness might also be remedied.* **In understanding something so intensely personal as teaching it is critical that we know about the person the teacher is.** *Our paucity of knowledge in this area is a manifest indictment of the range of our sociological imagination. The life historian pursues the job from his [sic] own perspective, a perspective which emphasizes the value of the person's own story.* (Goodson, 1981, p.69; original emphasis, cited in Goodson & Numan, 2002, p.269)

In life-history the teacher's life should be the main focus, the starting point for the study of practice, since it seems 'less threatening', according to Goodson.

In self study we start from practice and arrive at the study of self since it is not possible to study the practice without understanding the self, as practice is embedded in self.

The discussion of the categories examined shows that both methodologies have essentially the same aim and that in combining them we can further elucidate our object of analysis and enrich our proposal in transforming teachers' practices.

229 - Teachers' Voices: The Professional Lives of Icelandic Teachers

Hafdís Guðjónsdóttir* and Sólveig Karvelsdóttir*

School of Education, University of Iceland
hafdgud@hi.is

Abstract: The primary action of this study was to hear teachers' voices, and support them to be heard in the society as well as in the professional world. Qualitative research methods were used to create opportunities for r\eiterated cycles of interviews in partnership with six teachers. Working together we aimed to reveal a holistic perspective of the changing nature of the teachers' work and professionalism. Processes included focusing on the work, lives, knowledge and ethics of the teachers, interpretation of the consequent information about the nature and dimension of their work in education. By gathering and documenting their experience our intention was to gain a better understanding of the new professional lives of teachers and in doing so to be able to use the results for the development of the teacher education.

Keywords: teachers, teacher professionalism, teachers' jobs, teacher commitment

INTRODUCTION

International research reports changes in both teachers' work and teaching environments. Despite local variations, common factors can be seen across many countries: government intervention, increasing teachers' workloads, little attention to teachers' identities or the importance of teacher wellbeing (Day & Gu, 2010). While we know a great deal about teachers work, we also know that the profession is diverse and extensive. We hear from teachers that the work and expectations are constantly changing and becoming more challenging (Guðjónsdóttir, 2000). Some are concerned about the teaching profession and point out that constancy is missing, that the "best" university students don't become teachers, or after having gone through teacher education programs students do not return to the field and that a number of those who begin their carrier, particularly subject teachers, do not last very long in the profession (Darling-Hammond et al., 1999; Van Kraayenoord, 2001). Others, such as Halperin and Ratteree (2003) cited research demonstrating that "a silent problem" was emerging — namely that a growing shortage of teachers across the world was appearing in response to inadequate support of teachers' human and professional roles.

Yet, in spite of these negative observations and the demands of the work, many people do make it their lifelong profession and become successful teachers. Hargreaves (1994) assumption is that it is not the salary, expanded reputation or promotion that keeps teachers going, instead it is the passion and the reward that is built into the profession, the joy of working with children, to care for and support them. He believes teachers feel their importance. That teachers are pleased when they think about certain incidents although they admit to have experienced frustration, inequity or difficult situations (Gose, 2007). Brunetti (2001) conclusion from research findings was that working with young people and seeing them learn and grow is a principal motivator for teachers. Stanford (2001) came to similar conclusion, to make a difference in students' lives and learning was prominent reason to stay in the profession.

The primary action of this study was to hear teachers' voices, and support them to be heard in the society as well as in the professional world. Qualitative research methods were used to create opportunities for reiterated cycles of interviews in partnership with six teachers. Working together we aimed to reveal a holistic perspective of the changing nature of the teachers' work and professionalism. Processes included focusing on the work, lives, knowledge and ethics of the teachers, interpretation of the consequent information about the nature and dimension of their work in education. By gathering and documenting their experience our intention was to gain a better understanding of the new professional lives of teachers and in doing so to be able to use the results for the development of the teacher education.

LITERATURE AND THEORETICAL FRAMEWORK

It is important to study teacher's work from different perspectives (Hargreaves & Goodson, 1996). Each teacher is unique, and by listening to their stories we have the opportunity to build a holistic picture of their professional lives. Furthermore, we can see the similarities and differences between teachers in one country and between countries (Levin, 2003).

As noted above, changes in society affect teachers work. For the last decades radical changes have taken place around the world as well as in the Icelandic society. Women's participation in the work force is more than 80% in Iceland, which is among the highest in Europe. Technological advances are constantly growing and the accessibility of information has rapidly changed. Migration is growing which means that the diversity in the student group according to language, culture and religion is becoming greater and inclusive education draws also a more diverse group of students into the schools (Guðjónsdóttir & Karlsdóttir, 2009). Children spend longer hours in school and teachers report that the upbringing is increasing at the cost of the academic work (Jóhannesson, 1999; Karvelsdóttir, 2004). In addition to these changes the increase in government intervention into the teachers' role and the work in schools has lead to a number of changes that effect their professionalism: for example increased workload for teachers, little attention to teachers' identities or the importance of teacher wellbeing are all factors (Day & Gu, 2010).

In Sólveig Karvelsdóttir's (2004) research about teachers' work and feelings in a challenging school neighborhood, the teachers sincerely discuss their work, their workload, worries and emotions. According to Hargreaves (1994) teachers' responsibilities are more extensive and their roles more diffuse than before. He wonders what these changes mean, how to understand them, and if the job is getting better or worse.

Day and Gu (2010) indicate that teacher professionalism continues to be associated with a strong knowledge base, ethical commitment to students, professional responsibility and management classroom practice. They also point out that teachers who are committed to their work and to their students are also ready to learn, to develop and to change. Teachers who are effective teachers are passionate about their work, their students, their subject, and believe that the way they teach can make a difference in student lives. This is not a choice between knowledge, pedagogy or art as all are needed (Cameron, 2007). For teachers, to be effective, strong knowledge of pedagogy and in their subject is needed, but also a strong feeling for the work that includes passion, responsibility and a commitment. However teachers need support and encouragement to become and sustain this commitment and energy. Support from school leaders and colleagues can make a difference, but also that politicians, policy makers, the teacher education pay attention to that the lives and work of teachers is intertwined, and the focus must be on the physical condition, and the psychological, emotional and social environment (Day & Gu, 2010). Commitment and engagement is the key for good teaching and effective learning and is related to the feeling for the individual and a holistic perspective on the wellbeing, self-efficacy, agency and professional identity (Day, 2004).

Circumstances that are related to situations in the life of each individual, especially things that are related to personal or professional challenges, effect teachers' commitment and their abilities to be resilient. An understanding of why some teachers have the resilience that is necessary to stay in teaching, a job that is continuously developing and becoming more and more complex, is the key to support teachers to develop the competence needed for good teaching. Lortie (2002) believes that continuous education has supported teachers' development and that teacher reflection means that teachers spend more time to think about their decisions and responses and the result is a better and more careful decision making.

It is important to study teacher's work from many different angels (Goodson, 1992; Hargreaves & Goodson, 1996). The education students receive relies on what teachers think, believe and do at the classroom level (Hargreaves, 1994). According to Levin (2003) each teacher is unique. By listening to the stories of many teachers we can get a holistic picture of their professional lives and see the similarities and differences between teachers in Iceland and between teachers from different countries. Thus, we believe that it can be useful to receive information from teachers and learn about their profession, attitude, ethics and vision. Many researchers and scholars have recognized the importance of researching teachers' work and learn about their profession from teachers themselves. Reporting the conclusion can inform others about teachers' work and build up understanding for the profession. It can influence the schools, the policymakers, and teacher education; strengthen it and improve (Connell, 1985; Jóhannesson, 1999).

METHODS AND DATA SOURCES

To understand the underlying phenomena of teachers' professional lives, it is critical to work collaboratively with teachers themselves and listen to their stories and their perspective of the profession. Thus, it is critical to create an opportunity for teachers to reflect on their practice and report stories from their professional lives (Loughran & Northfield, 1998). Qualitative research methods provide the opportunity to adapt the questions to the particular experiences of each teacher. The cyclical approach of critical research provides space for clarification and deeper discussion.

Data collection was created through semi-structured interviews with six teachers. The sample was purposeful and to maximize the participant differences, novice and experienced teachers, men and women, teachers who teach young children as well as teachers teaching adolescence where invited to participate. Their teaching

experience is from 3 to 35 years. This small number of participants doesn't give us all the variance we would like but the group is as mixed as possible.

Each teacher was given two opportunities to reflect on their practice. The teachers decided where the interview would take place, and chose either their school or to come to our workplace. Each interview took between one and one and half hour.

To support the teachers through their critical reflection we used the Professional Working Theory Instrument (PWTI) that provides a framework for reflection and dialogue on teachers' professional working theory (Dalmau & Guðjónsdóttir, 2002). The questions were open-ended inviting the teachers to elaborate fully their own lines of response.

Teachers' own "personal pedagogy" or "practical theory" or "living theory" based on theory, practice, and ethics lies behind everything they do (Handal & Lauvås, 1987; Muchmore, 2001; Whitehead, 1993). Built on these ideas the professional working theory is formed of the kind of understanding that evolves through the constant interplay of professional knowledge, practice, reflection and ethical or moral principles. Explicit professional working theory is developed through systematic and comprehensive critical reflection and collegial dialogue. So developed, professional working theory also contributes to the construction of professional identity, the creation of professional knowledge and the development of collegial approaches to practice (Dalmau & Guðjónsdóttir, 2002).

Data analysis went hand in hand with the interviews. We audio-taped the interviews, listen to them and transcribed. We have grouped them into the three main categories; practice, theories and ethics, but also by the themes and repeated patterns that emerged. To seek verification from the participants we have sent them drafts of reports as they have developed.

FINDINGS

Researchers' stories, their voices as they discuss their experiences as teachers and their hopes and beliefs form the basis of the findings. The chapter is divided into three categories; practice, theory and ethics — the quotes are direct words from the teachers' translation to English by the authors.

Practice

The teachers talked about their practice, told us about a typical day or a typical teaching periods. They found it hard to think of typical days, because they felt they are all different but they also said that is one of the reasons they stay in the job. The diversity makes the teaching interesting. Teaching is never boring, it is hard, demanding and challenging but not boring. Discussing the change a teacher of 28 years said:

> If I compare the teaching at present to my first years it has change a great deal. In the beginning we were teaching students, but we were not necessarily aware of students´ status or situation, at that time discussion about diagnosis had not really began. Our students either managed themselves or not. We had a group of students we supervised but we really didn't know their background nor did anyone expect us to do so. If we had challenging students we learned little by little how to work with them, but parent collaboration was minimum only twice a year except if something really huge happened. This has change a lot.
>
> Before I taught a lot each week, about 43 class hours for at least 15 years and in addition to that I was occupied with politics, curriculum writing, was a committee chairman and spoke about the teaching as my hoppy! I was very well organized, my teaching plans had to work what ever happened.
>
> These last years so many things have been added to the teachers' job, the teaching is more students focused, we view student status and check if they have been diagnosed. We try to understand his or her unquietness, ask us how we can encounter each student and this calls for much, much more time on the job. We think about different teaching strategies and that takes time also.

The teachers take notice of the National curriculum and the individual school curriculum as they plan teaching and learning. They use basic materials and add to it according to the students' needs and interest. "*I check the goals my students need to work towards and then I check if the main material covers that, if not I bring in exercises or mathematic problems from other resources. I also try to use something from students' daily lives.*"

In some of the classes the students create their individual learning plan along with their teachers. All the teachers find it important that their students become independent and responsible in their learning.

I use individualized learning in two subjects, Icelandic and mathematics. The students receive a plan for the whole week. In there I put in what is to be done in the other subjects but they decide themselves what to do in Icelandic and mathematics. I have a minimum requirement, a basic material that everyone has to cover . . . and then they set up their own plan. They are very clever in doing it.

The teachers find it fundamental to show interest in and care for the children. In an addition to that, again and again, they talk about the importance that the students are assured that they wish them to succeed in their learning. *"To motivate them I make them feel that they have some responsibility, that they can control things themselves and they can for example postpone the boring pages until later if they wish to do so. This makes them interested and passionate."*
According to the teachers that have long experience classes or students groups have become more and more diverse. This calls for differencing the teaching and responding to students' abilities, interests and experience.

I had four girls in one of my groups last year that had difficulties with learning, to read and Icelandic. They were 10th graders and were sick of school. It was a challenge to get them going, to help them build their confidence, to realize their abilities. If they were going to literature class, I read to them because it was hard for them; we discussed the content and wrote together. I would write the text on the blackboard and they would copy it. It mattered a lot to them to have the spelling right. We read a book together and then they did a collage to illustrate the content. We used the computers and they created webpage with a focus on their interest. In the end they had to take the same test as everyone else and you know they did very well and got high grades. The content was similar but they learnt it in a very different way.

Teachers stories from the classroom are endless, they talk about students learning, about success but also about disappointment. They find it rewarding when students with learning difficulties succeed or begin to believe in themselves.

Theory
Discussing what lies behind teachers' pedagogical decisions we learned that it doesn't only differ but it is often a tacit knowledge. One teacher said she had used theories to back her up at the beginning of her teaching carrier, but theories come and go, and come again. Now she relies more on her experience. However, she also point out that teachers must be able to discuss theories and debate to be at an equal stand with the once who consider themselves as specialists in education. *"You must have good knowledge of the theories if just to be taken seriously"...* Another teacher said: *"What I learned during my teacher education affects my teaching but I am not always sure where I take things from".* Others still rely on well known theorists.

First when I began my teaching I favoured Piaget and Vygotsky, then I discovered Tomlinson and she appealed to me, but now I look to Bruner's theory that one has to know the child's cultural background. I find it extremely interesting to step into the child's world.

In discussing theories one notices the emphasis on the child and on theories that have the child in focus. *"It is necessary to learn to know the child and it is a part of meeting the individual need."* The teachers find it difficult to discuss these things and tell us that they don't really build on theories it is more their experience that they take into count. However participating in this research and having the change to reflect on their experience and to discuss their job professionally one of the teachers reports:

When I finished my teacher education I did a final project on how to work with students. I kept my project but have not read it until few days ago I fetched it from my attic and read it again. It was very interesting because I am learning that the theories I wrote about in my final project are the theories that have been very strong and evident in my pedagogy through the years. Of cause literature theories are there since that is my subject, but Thomas Gordon, and from the Scandinavia countries Sverre Asmervik, Böe and Hilling are all theorists that I studied and as I read about their ideology again I realized where my pedagogy came from.

The teachers reported that they found it difficult to discuss theories. As they gained experience they relied on their experience not some theories they learned in school. They also confessed that they are not used to discuss this matter. *"It's not what we talk about at my school"*, replayed one of them as we asked about theories they relay on.

Ethics
All the teachers place emphasis on the students being happy at school. They say their emotional well being is important and it makes the ground for education to grow. *"How can we NOT start by fostering systematically their mentality, their feelings and well being?"* The teachers realize that they are role models for their students. *"It is important for me to smile. I have a picture of a big smile on my desktop to remind me to begin each day by smiling to the children."* They find it very important how they respond to students and what comes about on the job, what they do and how. *"I find it very important that my students come to class on time, that they turn in their assignments on time and therefore I must do the same myself."* They find it sometimes hard to be aloud to be human, to do mistakes or show their emotions.

> During my first years of teaching it was expected that I was tuff and had a hard-shell, I went through huge deprivation the first two years. I felt I had to change myself as a human being. I am very sensitive but I had to move away my emotions and put on a mask and play to get through.

Sometimes teachers have to teach something they don't agree with, something that is in the curriculum or they know students will be tested on in standardized testing. This they find frustrating. Other times they experience conflicts because they feel they need to cover some knowledge in a certain time but at the same time they have the feeling the students are not really learning.
Teachers discussed what kind of teachers they want to be or become.

> When I decided to become a teacher, which was not until close to my graduation, I started thinking of my values and what I felt was important for me as a teacher. I came to the conclusion that I wanted to become a teacher who cares, who shows empathy. I began my teaching carrier with one thing in mind and that was to make my children enjoy school.

Another teacher said: *"If I can make my students leave my class with the feeling of being able or the feeling of "I can" and "we all can", then I feel I have succeeded."*
Teachers´ practice, theories and ethics don't stand alone, they are interlocked and make the holistic picture of the new lives of teachers, the new professionalism. Hearing from the experienced teachers how their jobs have developed and changed and how the newcomers bring in different perspective of what they think teaching is, provided us with rich insights of teachers' professional lives.

CONCLUSION
Learning in partnership with teachers about their professional live was the fundamental basis of this research. The teachers found their job fulfilling and working with the children delightful. They emphasized the children's well being and success in the school. This is in accordance with Brunetti (2001) and Stanford (2001) who reported that the main motivator for teachers is working with their students and to make a difference in their lives. Or as one of the teachers said: *"The attitude towards the students comes first, number two is the teaching methods you choose, that you know them, and you need theories to justify your choice of teaching."* These stories show that the teachers possess a great knowledge of how children learn, the environment they need to be able to learn and how to work with children so they will succeed. From the stories we can also see that the teachers have a definite plan for their teaching and stretch individualization in their practice. They use theories and some mention specific theories or theorists others have created their own professional working theory. Teachers' knowledge is not always recognized and often tacit and stays with each individual teacher. However, it is important to value it, make it known and increase understanding for the teacher profession. It can influence and strengthen teachers' position and the teacher education. The results can also be useful for policymakers.
Teachers with long teaching experience discuss the changes they have gone through and say that teaching was more subject oriented when they began their teaching but now it is more student oriented. They find that this can also been seen in the responsibilities the society has added to the schools and the teachers. Teachers are not only teaching certain subjects but caring is becoming a greater part of the curriculum and participating in bringing the children up. The teaching is more student focused at the same time it has

become more centralized with a national curriculum with defined goals and objectives as a framework and evidence based teaching. This makes teaching complicated and calls for a new professionalism with strong knowledge in pedagogy and subjects, but also passion for teaching, responsibility and a commitment to children and the profession (Day & Gu, 2010). According to Reeves (2009) the new professionalism focuses on learner-center practice, clarity about moral and social purpose, evidence-informed practice, critical reflection, collegiality, collaboration and commitment to professional development and knowledge creation. In this research we learnt about teachers who have the resilience needed (Day & Gu, 2010; Lortie, 2003; Hargreaves, 1994) to stay in this complex and ever changing job that teaching is. Working with children and seeing them grow, develop and learn matters but for teachers to able to do so attention must be paid to their working condition and the environment (Day & Gu, 2010). Through partnership with teachers, the teacher educational community can learn about and understand why some teachers have the resilience necessary to stay in teaching and the encouragement to become and sustain this commitment and energy. Doing that we might learn what kind of working conditions is needed for the new professionalism to develop and grow and how to support teachers through teacher education.

*The research was a collaborative work of Hafdís Guðjónsdóttir and Sólveig Karvelsdóttir and the paper is written with an honour of Sólveig who passed away in January 2011.

236 - Teaching of French in Upper Secondary Education: Improvement of Interactive Speaking Proficiency through Peer Feedback

Joke Rentrop, Jacques Haenen, and Rick de Graaff

Utrecht University, The Netherlands
j.s.rentrop@uu.nl

Abstract: Ample research is available about how learners acquire a second or a foreign language, how they learn while speaking in interaction and which kinds of tasks provide opportunities for meaningful use of the target language. Less research has been conducted into the manner in which learners learn from each other while speaking together, observing interaction and giving each other feedback on their performances. The present study investigates these aspects in communicative teaching of French as a foreign language in upper secondary education. We designed a curriculum consisting of speaking activities, constructed on the basis of a fixed task format, and a rubric for assessing the performances during the execution of the speaking tasks. Twenty-five students and a teacher of French participated in this project. The students learned French as a foreign language. They performed seven interactive and communicative speaking activities in which they executed the roles of interlocutors and observers. First results indicate that these activities stimulate the students in thinking about and interacting in the target language.

Keywords: classroom research; communicative teaching of French; interactive speaking proficiency; peer feedback; upper secondary education

INTRODUCTION

Language teachers experience great difficulties in stimulating their students to speak the target language. In the Netherlands, this is certainly the case for French. Much time and energy are needed from the part of the teachers in order to engage their students in oral language acquisition situations in which the target language is practised. There is much research about how (foreign) languages are learned and how language acquisition is facilitated while speaking in interaction (cf. interaction-hypothesis: Long, 1996) and which kind of tasks provide opportunities for meaningful use of the target language (e.g., Task Based Learning: Willis, 1996). From second language acquisition (SLA-) theories we know that exposure to comprehensible input and negotiation of meaning in interaction are necessary for effective language speaking learning to take place. Less research has been conducted into the manner in which learners learn from each other while speaking together (peer modelling), while observing interaction and giving each other feedback on their performances (student-led or peer feedback). Moreover, cognitive learning theories suggest that thinking about and reflecting on second language learning processes are important facilitators for the improvement of speaking proficiency (Ortega, 2009). In addition, learners need feedback on their performances while learning the language and using it in different situations. All these different perspectives and insights have to be taken into account when teaching and learning a foreign language. In order to investigate these aspects and to collect data on speaking, peer feedback and modelling, we designed an experimental curriculum for learning French as a foreign language (L2 learning setting) with speaking activities aimed at improving the students' interactive proficiency. During the execution of these activities the students performed the roles of interlocutors and observers.

In the following sections, we will first review research on interactive speaking, observational learning and peer feedback in L2 learning settings. Next, we shall illustrate the design of the curriculum by giving examples from the practice of intervention. In order to evaluate the results of these interventions, we made use of questionnaires, completed by the students, and interviews with the teacher. The research is still ongoing and runs throughout this school year (August 2010 till June 2011), so we are still in the very process of collecting data and have not had the opportunity yet to fully analyze this. We will conclude by giving recommendations on implications and further research.

INTERACTIVE SPEAKING AND PEER FEEDBACK

The main question of many foreign language teachers is how to encourage students to make use of the target language in the classroom. Starting and experienced teachers, often struggle with the daily teaching practice in which students speak in their mother tongue or complain that it is too difficult to use the target language after the teacher's request to speak French, German or Spanish. In general, learners are not used to being taught in the target language. Moreover, Dutch students only have Foreign Language lessons two or three hours a week inside school. They work with textbooks in which the instructions of the tasks are mainly written in Dutch. In addition, the instruction by teachers is not always provided in the target language. As a result, there is little exposure to input within the context of the classrooms. Outside school there is not much exposure either. This picture is totally different for English as a foreign language: young people grow up with the English language; they hear or sing English songs, watch English films, play games and therefore use English in interaction.

Against this background we designed a new curriculum for teaching French in upper secondary education. It is an exploratory study on curriculum development in which the complete process of teaching interactive speaking proficiency in French at an introductory level has been described. This process took place in one project lasting eight months and consists of lessons with specially designed assignments, followed by instruments for evaluating the results. Although using the materials offered by the textbooks in use, we had to change and freshly design these materials in order to make them suitable for our purposes. Or, to put it differently, we started from scratch, while at the same time staying within the current teaching process in that particular classroom that happened to be our experimental class.

In designing our experimental course, we encountered several problems. We could only overcome these problems by explaining and discussing the themes that we considered important for stimulating the use of the target language by students within the context of an experimental curriculum. Therefore we have designed a curriculum in which we focus on the following methodological principles (MPs) that are relevant for teaching foreign languages.

METHODOLOGICAL PRINCIPALS (MPs)

Some relevant SLA-methodological principles

Methodological principles (MPs) are universally desirable instructional design features, motivated by theory and research findings in SLA, educational psychology, general educational curriculum design, and elsewhere, which show them either to be necessary for SLA or facilitative of it (Long, 2009). MPs specify *what* should be done. One of these MPs is for instance: *promote learning by doing*. From these perspective research findings in SLA it can be concluded that frequency of usage determines acquisition (Ellis, 2002). Another research claim with great practical potential, i.e. is the Comprehensible Output Hypothesis (Lynch, 1997; Swain 1985): producing the target language may be the trigger that forces the learner to pay attention to the means of expression needed in order to successfully convey his or her own intended meaning. The idea that learners acquire language through interaction is supported by Long's (1985, 1996) so-called Interaction Hypothesis. During interaction interlocutors must provide each other with comprehensible input in order to convey meaning. Long's hypothesis sets out to define how learners provide each other with input that is mutually intelligible.

Another MP formulated by Long, is; *use task, not text*. In order to stimulate real communication in the target language in school, communicative tasks are necessary. The value of communicative tasks in supporting language acquisition has been discussed by various authors, including Ellis (2003). Tasks directed at sharing personal experiences elicit interaction on social and personal topics. A task should also elicit cognitive processes (such as classifying, ordering and evaluating) and have a communicative outcome. An activity is genuinely communicative if it involves at least two participants working together to complete a task by exchanging information possessed by one and not the other (Gatbonton & Segalowitz, 2005, p. 331). Two requirements for genuineness of communication are implied in this definition. First, new information must pass from one interlocutor to the other (an 'info gap' is filled), and the solicited information must be crucial for the continuation of the assigned task (the task can be made more communicative by introducing an overall goal, such as finding out what the students have in common). Based on these requirements for genuine communication, tasks can be classified into three categories from the perspective of which kind of 'info gap' has to be filled in (Prabhu, 1987; Willis, 1996): information-gap activities involving a transfer of given information from one person to another, reasoning-gap activities involving the discovery of new information through inferences, and opinion-gap activities involving the identification and expression of

personal preference or attitude. These types of tasks could be part of genuine communication and have to be taken into account when two participants are communicating.

Levels of attainment derived from the Common European Framework of Reference (CEFR)
However, a second point has to be taken into account as well, because the type of communication can be executed on several levels, ranging from basic to proficient, bringing us to the question: how to define levels of attainment into tasks? The Council of Europe (2001) has developed a Common European Framework of Reference (CEFR). This CEFR is a document which describes i) the competences necessary for communication, ii) the related knowledge and skills and iii) the situations and domains of communication. Three broad levels are distinguished:
- Basic User: A1 and A2
- Independent User: B1 and B2
- Proficient User: C1 and C2

For our purpose, which is teaching interactive speaking proficiency in French at an elementary level in upper secondary education, only the level of the 'basic user' is relevant. The students who participated in our research, learned to communicate at the level A2. The CEFR is an evaluation instrument through which students can make their level of proficiency visible, formulated in the form of 'can-do statements' (see Appendix 1 for examples). For instance, descriptors of such 'can-do statements' at the level A2, for 'spoken interaction', are formulated as:

> I can communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar topics and activities. I can handle very short social exchanges, even though I can't usually understand enough to keep the conversation going myself.

Actually, we included this description of 'spoken interaction' at the level of A2, because this is also the learning goal of interactive speaking proficiency in French we wanted to achieve with the students participating in our research to achieve. In order to reach this goal we based our experimental curriculum on several methodological principles derive from research findings in not only SLA but also in educational psychology.

Some relevant educational research-methodological principles
To some extent, in our designed curriculum, some aspects of the teacher's role are conveyed to the pupils themselves. The pupils are working together within the context of cooperative and task-based learning (*MP Promote cooperative / collaborative learning*) and therefore the students themselves became part of the feedback process. Apart from being interlocutor as one of two participants during the process of communicating, every student fulfilled the role of observer of the communication between his/her fellow students. As teachers, we tend to think that providing feedback to our students is done exclusively by ourselves, but there is no reason why students should not be part of the feedback process. For this, students have to learn how to observe the fellow students' performances of speaking proficiency in order to provide them with useful feedback. This turned out to have a powerful effect on their own performances (Hattie & Timperley, 2007).
The manner in which students provide feedback is particularly important. In order to provide feedback students need the criteria of our expectations from the students during the execution of the speaking tasks. In order to help the students make an assessment of the observed performances, we compiled a rubric to be used by the students. This rubric was aimed at being a powerful tool for structuring the process of peer feedback.
In summary, we included the following MPs in the experimental curriculum:
- cooperative and task-based learning (Johnson & Johnson, 1994)
- roles of interlocutor and observer of communication (Braaksma, 2002)
- peer modelling and providing peer feedback based on observing (Braaksma, 2002)
- rubrics for the content of speaking proficiency (Sadler, 1989)

PURPOSE OF THE STUDY AND THE RESEARCH PROBLEM
How can we implement MPs in the classroom? The main goal of this article is to propose a Communicative Language Teaching (CLT) approach to curriculum design. In the newly designed experimental curriculum for the improvement of French speaking proficiency, we made use of different forms of feedback given by the students themselves based on observing each other during the speaking assignments. We are focusing on students of 16/17 years old, in upper secondary education (level A2, based on the competencies proposed by

the CEFR), learning French as a foreign language with the help of a curriculum consisting of the following instructional practices:
- interactive and communicative speaking activities, based on:
- a fixed format in which students, in groups of three, alternately execute the roles of interlocutor and observer;
- use of a rubric which has been developed in order to support the process of giving feedback by the observers.

The overall research problem is how to improve the students' interactive speaking proficiency through peer feedback. Based on this research problem, we formulated the following three research questions:
1. How can we stimulate students to use the target language during speaking interaction assignments?
2. What are the instructional practices for providing student-led feedback based on the observation of speaking activities executed by fellow students?
3. What progress do the students make in interactive speaking proficiency based on the newly designed experimental curriculum?

METHOD
This study is an embedded case study design (Yin, 2003). A whole class is involved and the analysis of the data is focused on how the participating students and their teacher are executing the assignments for enhancing speaking proficiency and how they appreciate the progress in teaching and learning.

Participants
The participants in this experimental study were one experienced teacher of French and one class of twenty-five 16/17-year-old students of a secondary school in the Netherlands. All students of this class participated in the study and we collected our data through their activities and opinions.

Setting
The experimenter's role is to prepare and to organise a series of assignments, and the teacher's role is to coach and guide the students during the execution of these assignments. We started the project 'interaction and communication in French' with a kick-off meeting in week 35. At the beginning of each assignment, the teacher distributed handouts with the instruction on the task. All tasks were learner-centred, so the learners/students had to read the instruction carefully, because it is the task itself which provides the information on the working and learning process of the students. After reading, the students did an individual pre-task, and a task in groups of three. We also developed a task-specific rubric. This rubric consists of a set of descriptors. It refers to specific content and to generic dimensions, such as pronunciation, fluency, grammar, vocabulary, based on the CEFR, level A2. The pupils used the rubric as a checklist in order to prepare their own performance and to give feedback on the performance of their classmates. Peer feedback in this phase plays a crucial role in order to improve speaking proficiency.

Materials
We designed a series of assignments aimed at eliciting speaking activities. In terms of the Communicative Language Teaching (CLT) approach, all these assignments function as scaffolds for the development of the students' interactive speaking proficiency by mutual exchange, negotiation and co-construction. Therefore, a wide range of complementary activities is needed.
The framework of the task consists of a pre-task phase and a task phase. The pre-task phase is the shortest phase in this framework and could last between five and ten minutes. It prepares students to do the task. The questions in the task guide them to generate ideas and to focus on the content and the language. The aims of this phase are: starting up the thinking processes; activating prior knowledge about how they learn and which language they need and motivating them to learn.
The task phase is the longest phase and could last between thirty and forty minutes. Students do the task in groups of three. They alternate the roles of interlocutor and observer. The task-cycle consists of the performance of the task, the observation of their classmates during the performance, the feedback after the performance, and vice-versa.
The students need a reason to speak to each other. Therefore we designed information-gap activities. Each student in this group has information that the other students do not have. The aims of this phase are: interacting in the target language, helping each other to fill in the info gap and giving tips and tops (observers).

In order to give an impression of a designed task, we have added an example of this phase. In Appendix 2 we have added an example of a complete task, written, of course, in the target language. In Appendix 3 we have compiled the activities executed in phase 1, week 35 – 41 (2010).

Exercise 21, page 36 Task 'la météo'
Format in groups of three:
- Number one doesn't show his or her map, but presents the today's weather. He started with: today it's … in Paris/ … Number two draws the weather, the temperatures and the cities on the map. Number three shows his map and controls the results. Next, numbers one and two exchange their reasons why they hope that tomorrow or the day after tomorrow the weather will be ... They ask each other a question about this wish.
- Number three listens, writes down a tip and a top and gives feedback at the end of the conversation.
- Next, number three presents the weather, number one draws. Number three shows his map. They do the conversation. Number two listens and gives tips and tops.
- Finally, number two presents and two and three do the conversation. Number one listens and gives tips and tops.
- They swap roles.

Data sources
Data are being collected from various sources, in which both the students and the teacher participate. We make use of questionnaires, observations and classroom discussions with the students. The interviews with the teacher are aimed at collecting information on her opinion about the students' learning processes elicited by the designed tasks. Observations are focused on what students are doing during class and how they interpret and execute the tasks. All these sources will be providing us with a lot of information about how to improve the students' interactive speaking proficiency in French.

RESULTS, DISCUSSION AND CONCLUSION
The first results indicate that the execution of the designed activities and assignments stimulate the students in thinking about and interacting in the target language. However, within the context of this paper, no further results, discussion and conclusion will be included. The research is still ongoing and runs throughout this school year (August 2010 till June 2011), so we are still in the very process of collecting data and have not had the opportunity yet to fully analyze them in relation to the research questions. This will be done in the following version of this paper and will be presented at the ISATT2011 conference.

http://www.languages.unimaas.nl/niveaus_common_european_framework_reference/CEF_English.htm

LEVEL		A1	A2	B1
SPEAKING	**SPOKEN INTERACTION**	I can interact in a simple way provided the other person is prepared to repeat or rephrase things at a slower rate of speech and help me formulate what I'm trying to say. I can ask and answer simple questions in areas of immediate need or on very familiar topics.	I can communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar topics and activities. I can handle very short social exchanges, even though I can't usually understand enough to keep the conversation going myself.	I can deal with most situations likely to arise whilst travelling in an area where the language is spoken. I can enter unprepared into conversation on topics that are familiar, of personal interest or pertinent to everyday life (e.g. family, hobbies, work, travel and current events).

Appendix 2: Example of the structure of a designed task
La météo, exercice 21
Grandes Lignes, cahier 2, havo 4, niveau CEFR: A2

Antisèche

1. Quel conseil as tu eu la dernière fois? Ecris comment tu vas faire attention à ce point-là.

2. Quel temps fait-il aujourd'hui ? Dessine toi-même une carte météo de la France sous forme d'une hexagone:
Ecris les mots nécessaires dont tu as besoin.
Ecris en mot-clés pourquoi tu voudrais savoir les prévisions de la météo de demain ou d'après demain.

Exercice 21 à la page 36 Tâche préparatoire
Déroulement: à trois:
- Le numéro 1 ne montre pas sa carte météo, mais présente le temps qu'il y fait. Il commence par: aujourd'hui il ... à Paris/ ... Le numéro 2 dessine le temps, les températures et les villes sur la carte. Le numéro 1 montre sa carte et contrôle le résultat. Ensuite les numéros 1 et 2 échangent leurs raisons pour lesquelles ils espèrent quíl fera ... demain ou après-demain. Chacun pose une question sur ce souhait.
- Le numéro 3 écoute, écrit un conseil et un compliment et échange-les à la fin de cette conversation.
- Ensuite le numéro 3 présente le temps, le numéro 1 dessine. Le numéro 3 montre sa carte. Ils font la conversation. Le numéro 2 écoute et donne des conseils et des compliments.
- Finalement le numéro 2 présente et 2 et 3 font la conversation. Le numéro 1 écoute et donne des conseils et des compliments.

Phrases/mots utiles:
Quel temps fait-il aujourd'hui? Quel temps fera-t-il demain ou après-demain?
Il pleut/ pleuvra, il neige/neigera, il ya des nuages/ il y aura des nuages, il fait beau/ il fera beau …
Demain je vais faire du vélo. J'espère qu'il fera sec.
Question possible: pourquoi tu ne prendras pas le bus?
Après-demain je vais me promener avec mon chien. J'espère que les températures seront en hausse.
Question possible: pourquoi tu trouves cela important? Tu pourras mettre des vêtements chauds.
Bof, mais moi je n'aime pas vraiment le froid, la pluie …
Oui, exactement!
Je ne connais pas le mot en français, tu pourrais m'aider?

Appendix 3: Interventions

Phase 1 2010 Week 35 - 41

<u>Kick-off meeting</u>
- Kick-off meeting of the project 'interaction and communication in French', the topics and the tasks.;
- Presentation of the researcher;

Questionnaire 1:
- Items about the task instruction, their interest in the project and the students' attitude towards and experience with interactive and communicative speaking activities

<u>Designed speaking activity 1</u>; *Une enquête sur les ados et les marques*
Type of task
- Information- and opinion-gap activity;
- Reading activity in textbook and speaking

Format
- in groups of three, alternating execute the roles of interlocutor and observer

<u>Speaking activity textbook</u>; *Mon style à moi*
Type of task
- Preparation for an assignment
- Mood board

Format
- in groups of three, alternating execute the roles of interlocutor and observer

<u>Designed task-specific rubric</u>

<u>Assignment</u>
Type of task
- Presentation of the mood-board

Format
- Half of the group, role of observer, listening and filling in a simple evaluation form

Questionnaire 2:
- Items about the learning outcomes of the observing activity

<u>Designed speaking activity 2;</u> *Sortir*
Type of task
- Information- reasoning- and opinion-gap activity
- Listening activity in textbook and speaking activity on the basis of a holyday diagram, filled in by the pupils.

Format
- in groups of three alternating execute the roles of interlocutor and observer

Questionnaire 3:
- Items about their interest in observing the speaking activities, the learning outcomes of the observing activity, the collaboration process and the content of the info-gap the learning outcomes of the observing activity

244 - Teacher Professional Development through a Teacher-as-Curriculum Maker Lens

Cheryl J. Craig

Department of Curriculum and Instruction, University of Houston, USA
ccraig@uh.edu

Abstract: How teacher professional development is conceived, approached, and studied communicates the view held of teachers. It also conveys the conception of knowledge underpinning teacher learning and how experience figures into the chosen perspective. Most often, others' prescriptions of what teachers should know and do takes precedence over teachers' personal professional understandings of their growth. In this chapter, a different image of teachers—teachers-as-curriculum-makers—will be presented, along with a different notion of teacher knowledge, a personal practical view emerging from the narrative continuities of teachers' lives. The consequences of not focusing relentless attention on teachers as learners along the career/life span and all that "the paradigm of the practical" (Greene, 1994) has to offer will also be considered, together with the long-term impact on the teaching profession.

TEACHER IMAGES | TEACHER KNOWLEDGE

The dominant image of teachers-as-curriculum-implementers upholds the position that teachers are merely agents of the state, paid to do its bidding. In this prevailing view, shifts in teachers' practices occur because policy makers at various levels of the system mandate changes that teachers must dutifully—due to legal requirements/subordinated line positions/lack of power—follow. Within this scenario, the teacher is a "technician, consumer, receiver, transmitter, and implementer of other people's knowledge" (Cochran-Smith & Lytle, 1999, p. 16). This image of teachers as being positioned in an educational conduit (Clandinin & Connelly, 1995; Craig, 2002), delivering curriculum products to students, has spread like wildfire in the teaching enterprise, particularly in the policy arena, but also significantly within the theoretical terrain due to theory's long-standing estrangement from practice (Schwab, 1969). Clandinin and Connelly (i.e., 1995) liken this top-down approach to change by injection, with each new injection resulting in new knowledge prescriptions for teachers. Sadly, externally imposed measures tend to be disconnected from what teachers have experientially come to know and do in their practices. This is highly problematic because teachers' practices reflect their personal practical knowledge in action (Connelly & Clandinin, 1985; Clandinin, 1986), not simply what others expect of them, although others' expectations enter the mix (Clandinin & Connelly, 1992).

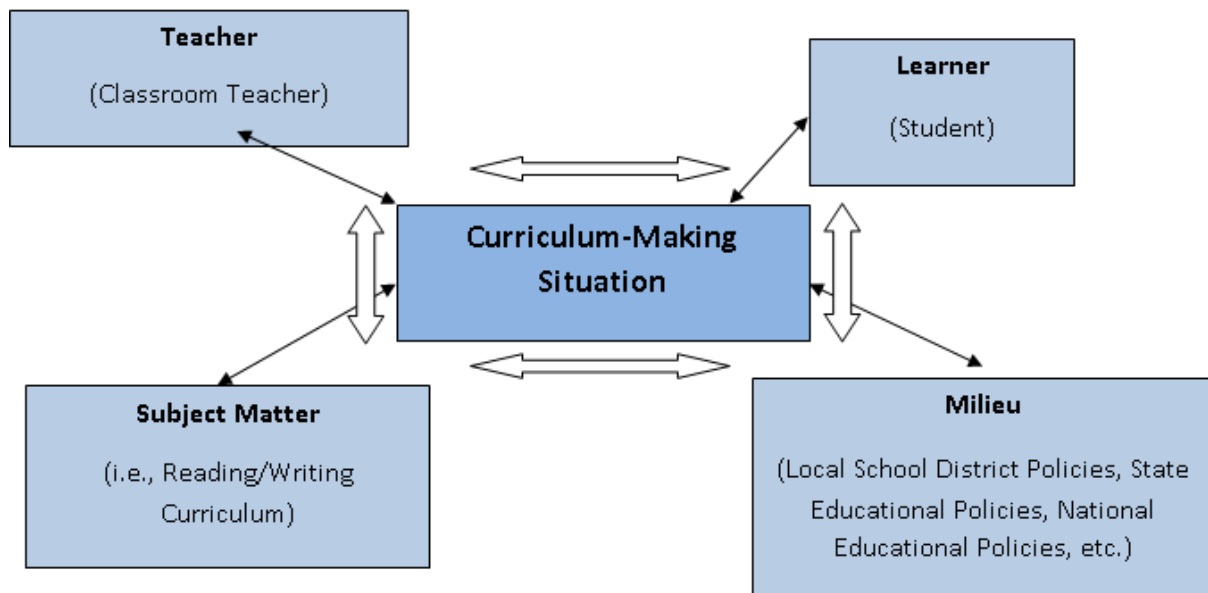
But this prevailing paradigm ignores the existence of an alternate image of teaching, one that is more sensitive to teachers as active agents (Schwab, 1954/1978) and the mindedness Dewey (1908) afforded them. In this view, teachers are curriculum makers—"the fountainhead of the curriculum decision" as Schwab (1983, p. 241; also see Fox, 1985, p. 77) put it—who "*must* be involved in debate, deliberation, and decision about what and how to teach" (Schwab, 1983, p. 245, italics in original). The image of the teacher-as-curriculum-maker focuses attention on the primacy of the teacher in organizing, planning, and orchestrating classroom interactions because only the teacher is situated at the interstices of the curricular exchange and meets students face-to-face. Thus, curriculum is what happens—what becomes instantiated—in the moments when teaching and learning fuse. In that fusion (see Figure 1), teachers use what is in their students (learner commonplace), their teaching situations (milieu commonplace) and themselves (teacher commonplace) to make curriculum (typically organized around the subject matter commonplace) in a way that cannot be captured in a codified knowledge base without negating the continuity of experience (Dewey, 1938) that facilitated the human knowing.


Figure 1: Schwab's commonplaces of curriculum

In a nutshell, knowledge culled from experience cannot be "tested, packaged, imparted and sent like bricks across countr[ies] to build knowledge structures that are said to accumulate" (Eisner, 1997, p. 7) because the teacher, like the student, is indispensable to the body of knowledge that exists (i.e., Dewey & Bentley, 1949; Fenstermacher, 1994) and essential to the curriculum making act (Schwab, 1983). In essence, the teacher is "the most responsive creator of curriculum" because he/she "negotiates the formal planned curriculum of governments and publishers within his/her practice, alongside the lives of learners" (Murphy & Pushor, 2010, p. 658). Consequently, in the teacher-as-curriculum-maker image, attention turns from written plans, authorized textbooks and government mandates (Clandinin & Connelly, 1992, Connelly & Clandinin, 1988), which typically privilege the subject matter commonplace and confine the teacher to a dispenser of knowledge role, to curriculum as it is lived within the context of people's lives (Downey & Clandinin, 2010), a mingling of Schwab's four curriculum commonplaces (teacher, learner, subject matter, milieu) mediated by the teacher. And, in stark contrast to lists of codified knowledge, stripped from context, disembodied from persons, and devoid of relationship, what emerges are the most important aspects of teacher knowledge, which are "ephemeral, passionate, shadowy and significant…for the most part…reflect[ive of] teachers' lives" (Connelly & Clandinin, 2004, p. 42).

TEACHER KNOWLEDGE | TEACHER PROFESSIONAL DEVELOPMENT | PUBLIC POLICY

When the image teachers are expected to live subjects them to policy makers who dictate and manipulate knowledge as if it could/should be possessed, measured, and reified as an indicator of teacher effectiveness, the idea of teacher professional development falls victim to the shifting whims of decision-makers and takes the form of one-shot training sessions. Such one-size-fits-all sessions typically do not build on what individual teachers already know and do. Instead, teacher professional development is approached generically—as if all teachers exhibit the same malady and are in need of the same antidote. Even more troubling is the underlying belief that teachers' knowledge is deficit and not simply in need of further cultivation, but requiring total replacement. This mindset recently surfaced in my longitudinal work with Daryl Wilson, a middle-school literacy teacher in the U.S., whose professional development experiences I have studied since 1998 (Craig, 2010). Despite Daryl's stellar teaching record and ongoing teacher leadership role in his school, he was expected to abandon units of study that held great personal meaning for him and had been well-received by his literacy students and their parents to teach what a consultant—unfamiliar with the students, school, and district—declared more appropriate.

This type of external manipulation of the teaching/learning act is troubling from a teacher knowledge point of view and problematic from a policy perspective. As Cohen and Garet (1975), among others (Cremin, 1990; Olson & Craig, 2009, Tyack & Cuban, 1995) have maintained, educational policy tends to be a "grand

story" of loosely connected ideas that are often based on "faulty logic" that "lack explanatory power" (Cohen & Garet, 1975, p. 17). Such policy stories have to do with "a large and loose set of ideas about how [things] work, [what] goes wrong, and how it can be set right" (p. 21). These grand stories take a system view; they see things from a distance and "small" (Greene, 2000) because a "big" view (Greene, 2000) of how things play out in particular teachers' classroom situations has neither been fully recognized nor appreciated as the critically important linchpin in successful policy enactment. Greene (2000) further elaborated what she meant by "small" and "big" this way:

> To see things or people small, one chooses to see from a detached point of view,…to be concerned with trends and tendencies…To see things or people big, one must resist viewing other human beings as mere objects…and view them in their integrity and particularity instead (p. 10).

When big and small perspectives are linked with policy makers' approaches and behaviors, we find that what policy makers create is not a flexible framework that supports teachers as they interface with live students and inert curriculum documents (all the while drawing on their personal narrative histories and individual propensities), but frequently something more akin to "a bad eclectic" (Schwab, 1983). Put differently, various pieces of the policy puzzle do not fit snugly together despite teachers' valiant attempts to make them cohere in their face-to-face work with youth. Ultimately, different aspects of educational policy trace to different philosophical and pedagogical traditions that have accumulated over time, some of which conflict with one another.

In my research program, teachers in professional development sessions have focused on arts integration (Craig, 2006) and readers' and writers' workshop (Craig, 2009a)—approaches seriously impeded by the U.S.'s No Child Left Behind Act (2002), despite arts integration and the workshop approach also receiving support from policy makers. The article, "The contested classroom space: A decade of lived educational policy in Texas" (Craig, 2009b), captures several such theory-practice-policy collisions. The work suggests that the less-than-productive mixing of educational imperatives at the policy level, each justified by different theories, creates intractable tensions in teachers' practices and student learning due to the incommensurable nature of the eclectic that has been amassed, largely devoid of teachers' participation. For Schwab, potentially good practices (i.e., arts integration? readers' and writers' workshop?) built on less-than-good policies (i.e., No Child Left Behind?) suffer from "poisoning at the source" (Schwab, 1959/1978, p. 151). This further complicates the impossible roles of teachers (Schwab, 1959/1978) and teacher educators (Ben-Peretz, 2001). Not only are the forces of continuity and change with which teachers contend never ending, the management of the tensions arising from them has become increasingly unwieldy and politically charged, given the penalties associated with not complying with accountability mandates.

EXPERT KNOWLEDGE | TEACHER PROFESSIONAL DEVELOPMENT

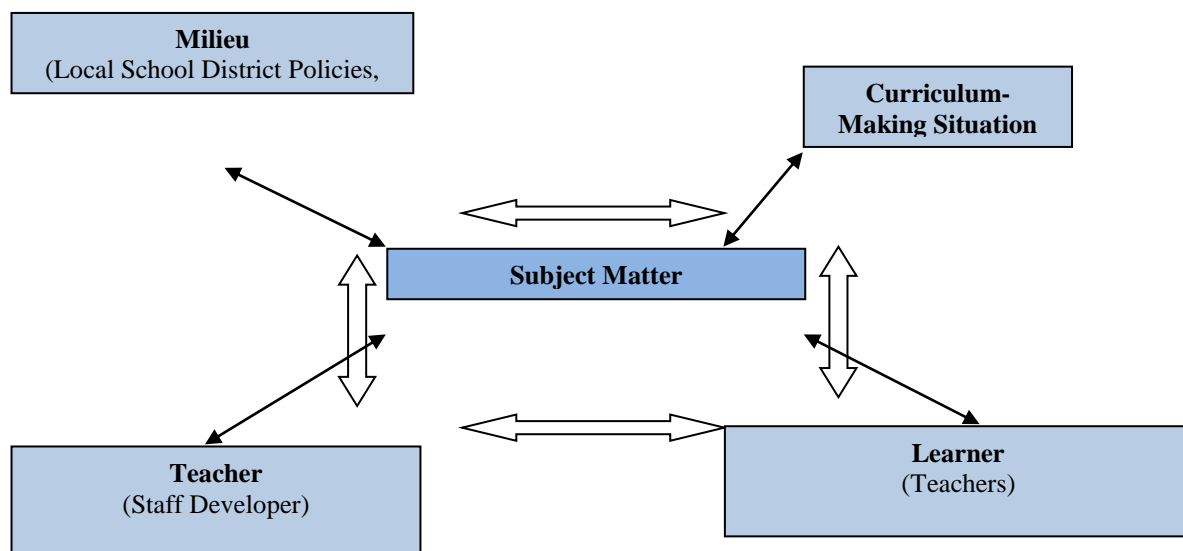
So far, conflicting images of teachers and problems arising from less-than-ideal educational policies and the consequences both have on teacher knowledge and teacher professional development have been discussed. Now, attention turns to a third major problem: expert knowledge and its relation to, and impact on, teacher professional development. Returning to Schwab's 'practical,' particularly his commonplaces of curriculum, one finds that in professional development pursuits (see Figure 2) teachers are positioned in the learner role (as opposed to their students) whereas staff developers and various other consultants, some of whom may be university professors, occupy the teacher commonplace typically reserved for classroom teachers. Milieu remains relatively the same as in other curriculum situations, but subject matter changes. It includes not only content knowledge from the disciplines, but also pedagogy and teaching dispositions as summarized, for example, in the National Council for Accreditation of Teacher Education (NCATE) standards in the U.S (2001).


Figure 2: Changes in the commonplaces of curriculum configuration

The re-configuration of the curriculum commonplaces places the teacher in this particular curricular situation in the vulnerable role of (adult) learner and once again shines the spotlight on the teacher-learner relationship. However, just as uneven power distribution exists in student-teacher relationships, power differentials are also present in teacher-staff developer relationships, particularly when professional development takes the form of training sessions where the teacher is expected to uncritically accept the knowledge of the hired expert as emblematic of 'best practice' rather than 'trying on' changes within the context of one's own classroom teaching and publically reconstructing one's personal story of what it means to teach. In short, the training mindset reduces the teacher as a human being to the mundane, repetitive role of a human doer whose doings are directed by others. Fueled by the technical rationalist philosophy, this approach assumes homogeneity among the teacher population and among the student population and within the skills set deemed lacking (Darling-Hammond, 1993). Furthermore, training revolves around predetermined skills and competencies (Bullough & Gitlin, 1994) that are understood behaviorally, and operates from a worldview which narrowly defines teaching and learning (Goodlad, 1994). Finally, in the worst case scenario, "performance training sects" may emerge where trainers "trap 'underdeveloped' schools and their teachers within cycles of minimum competence" (Hargreaves, 2003, p. 191).

As can be seen, the issues and implications of teacher learners working with expert trainers who represent the teacher commonplace are significant. The core issues reflect the teacher-as-implementer image of teaching and echo Schwab's warning about the roots of particular policies undermining well-meaning practices. But two associated questions critical to this chapter's focus also need to be raised: What is the difference between a teacher trainer and a consultant engaged in promoting teacher growth? How does expertise figure into these different roles and relationships?

To address these queries, I return to my longitudinal work with Daryl Wilson. Earlier, I spoke of how Daryl's expert knowledge of himself as a teacher, his students as individual learners, his state's reading and writing curriculum as he interpreted them, and the particularities of his school context as it changed over time during his tenure at the campus were rendered not only inconsequential, but totally inadequate and needing to be discarded in the face of the expert trainer's outside knowledge of the workshop approach to reading and writing. The personal and public turmoil this caused for Daryl and his colleagues—one comparing her experience to being held defenseless "like a butterfly under a pin" (Craig, in press)—raised the question of whether expert consultants can ever work successfully with expert teachers such as Daryl and other members of his literacy department, due to the inequities in human relationships and clashes in expertise and despite the teacher-as-curriculum-maker image openly acknowledging that teachers are experts in their own right who hold and express knowledge vital to the curriculum situation.

The answer to this query came earlier than anticipated, arriving in the form of the stories of experience (Connelly & Clandinin, 1990) Daryl Wilson lived and told, re-lived and re-told. In the summer months following Daryl and his colleague's two-year stint with the literacy trainer who left "army boot footprints on their practices" (another colleague's expression), Daryl chose to fly to a different state to attend a professional development session led by another literacy workshop expert whose approach significantly

differed from that of the first trainer. This second literacy expert challenged the gathered teachers—"in a good way" (Daryl's words)—to develop tension and beauty in their writing products through reflectively drawing on their personal experiences and engaging in the writers' workshop method. As a learner, Daryl returned to his school with drafts of how he wove beauty and tension into his story of running away as a teenager. The workshop enabled him to inspire his students using examples from his own essay. His students subsequently produced quality writing samples, also involving tension and beauty, and emerging from their teen experiences. Daryl additionally combined what he and his students had authored and presented the work to his colleagues in a literacy department meeting. In response, Daryl's peers

> …made it clear to him that his teaching example resonated with them—and that it, along with his student work samples, were products to which they—and their students—would aspire. One colleague distinctly noted that his lesson was not a "zinger lesson"—a fail-proof lesson that would work anywhere, anytime—like the ones the initial staff developer used to teach their students or the lessons the teachers routinely carried back with them from their summer training sessions in [other states]. (Craig, 2010, p. 432-433)

In this narrative exemplar (Lyons & LaBoskey, 2002) presenting a viable alternative to lists of codified knowledge, we witness different kinds of experts (literacy teacher/literacy consultant; literacy teacher/literacy students; literacy teacher/literacy department peers) working fruitfully together. Here, the teacher as a learner is more than a receptacle to be filled with knowledge by an expert trainer over the long haul or in the short term by "flavor of the month" training (an expression used by a high school teacher in an Olson and Craig inquiry [2001]). Schwab argued that prime examples of teacher learning occur when acknowledged experts (the consultant/Daryl) work with learners (Daryl/his students/his peers) in ways that attend to, and are mindful of, their wholeness as human beings. For Schwab, learners must be approached "not only [as] minds or knowers but [as] bundles of affects, individual personalities, earners of livings…They are not only group interactors but possessors of private lives" (Schwab 1969a, p. 9). In short, teachers' emotions and identities unavoidably come into play in change initiatives (i.e., Craig, 2004; van Veen & Sleegers, 2009).

Because of the human particularity associated with teacher learning, along with the fundamental need for the learner (teacher) to willingly accept the instruction of another human being (trainer/consultant), Connelly and Clandinin (2004) suggest that less lofty goals be sought in formal teacher professional development. They explain their reasoning as follows:

> We do not mean to imply that …formal teacher education be downplayed. [It is], of course, important. But we do think that, on the whole, there is more for most teachers to learn by coming, self-consciously, to grips with their own teacher knowledge than with what may be learned from a knowledge or skills for teaching workshop provided by others…Formal professional developers, must, of course, continue their work. This work should, we believe, be done in the context of an understanding of the significance of informal teacher education and, therefore, with a humble spirit and with modest expectations (p. 42).

Having addressed the role of experts and potential clashes between teacher expertise and expert knowledge of different kinds held by consultants authorized to instruct teachers, I address an equally complex issue: teacher learning in small group settings and its relationship to teacher knowledge.

TEACHER KNOWLEDGE | TEACHER KNOWLEDGE COMMUNITIES | PROFESSIONAL LEARNING COMMUNITIES

Ineffective one-shot workshops with little or no impact on teachers' daily work, persistent calls for increasing student performance through standardized testing/accountability measures/punitive sanctions/negative press coverage, and the issues swirling around expert knowledge, have resulted in recasting teacher professional development in terms of learning in community. In this form of teacher learning, leadership is ideally thought to be equitably distributed among participants (teachers/faculty/consultants) such as the fruitful way Kooy (2006) has interacted in the various iterations of her book club project. Schwab historically favored teachers at all levels sharing their knowledge. For him, teachers deliberating in community represent "a pooling of diversities of experience and insights" (Schwab, 1969b, p. 30). This stands in direct opposition to others of his generation who declared teachers' communal learning a "pooling of ignorance" (Schwab, 1950/1978, p. 107-108). Even today, modern critics—even some

who theoretically align with the teacher-as-curriculum-image of teaching, view it as "a ruse for giving teachers permission to 'do their own thing.'" This, of course, is a gross misrepresentation of what the teacher-as-curriculum-maker approach intends (Grimmett & Chinnery, 2009, p. 134).

Also, some individuals/groups corrupt the intent of professional learning communities by forcing them to fit their personal, administrative, and system-level agendas. This became clear in my long-term study with Daryl Wilson as I studied the development of teachers' knowledge in knowledge communities (Craig, 1995b, 1995c) within the context of organized school reform (Craig, 2001). When my research with Daryl first began, the readers' and writers' workshop initiative discussed earlier was couched in the language of teacher learning within a professional learning community. At face value, this suggested a version of a knowledge community. However, as early as my literature review (Craig, 2009a), I discovered significant differences between teachers' knowledge communities developed around the teacher-as-curriculum-maker idea and organically lived by teachers, and professional learning communities externally imposed by school administrators/school district personnel aided by university professors engaged in consulting activities. Before I unpack these differences, I share my understanding of teachers' knowledge communities:

> …safe, storytelling places where educators narrate the rawness of their experiences, negotiate meaning, and authorize their own and others' interpretations of situations. They take shape around commonplaces of experience (Lane, 1988) as opposed to around bureaucratic and hierarchical relations that declare who knows, what should be known, and what constitutes 'good teaching' and 'good schools' (Clandinin & Connelly, 1996). Such knowledge communities can be both found and created (Craig & Olson, 2002, p. 116).

Meanwhile, other educational researchers (e.g., DuFour, 2001, 2004; DuFour & Eaker, 1998; Fullan, 2002, 2004; Hargreaves, 2002) have defined professional learning communities. For this chapter, I adopt DuFour's conceptualization because the administrators in my study, along with some teachers, had attended several of his workshops. This suggested that DuFour's understanding of professional learning communities was possibly foremost, though not exclusively, on their minds. To DuFour (2001), professional learning communities "focus on learning rather than teaching, work collaboratively, and [are] accountable for results." According to him (DuFour, 2004), "people use the term to describe every imaginable combination of individuals with an interest in education—a grade-level teaching team, a school committee, a high school department, an entire school district, a state department of education, a national professional organization, and so on" (p. 6). Hence, when I placed my knowledge community conceptualization alongside DuFour's understanding of professional learning communities for comparison purposes (see Figure 3), the following differences emerged:

Knowledge Communities	Professional Learning Communities
Organically lived	Administratively introduced
Can be found or made	Expected to be present
Commonplaces of experience	Focus on learning rather than teaching
Relational among individuals and across groups; collaborations emerge	Collaboration anticipated at the outset
May exist within member of various groups; also occur between teachers who interact for their own purposes	Any visible group within a school/organization
Accounts of practice	Accountable for results

<div align="center">▼   ▼

Practical View of Knowledge   Formal View of Knowledge</div>

Figure 3: Comparing the qualities of knowledge communities (Craig) and professional learning communities (DuFour)

Also, as my close research with Daryl and his colleagues unfurled, I found that the idea of teachers' knowledge communities fit neither with the theoretical concept of professional learning communities as bureaucratically enacted nor with the narrow No Child Left Behind definition of the high quality teacher as expert in a specific content area. At the same time, the theoretically rich, socially conscious workshop approach to reading and writing neither resonated with the dogmatic approach to professional development the teachers experienced nor with the No Child Left Behind Act's singular focus on teachers' subject matter expertise. In fact, the serious ways that theory, practice and policy were out-of-synch with one another

exemplified the theory-practice-policy divide I mentioned earlier, comprising a leading educational issue in the first quarter of the twenty-first century.

LINGERING ISSUES | LATENT POSSIBILITIES

In this chapter, I have argued that teacher-as-curriculum-maker image is foundational to high quality teacher professional development and a productive lens with which to approach teacher learning. I surveyed the work of Schwab (U.S.) and Connelly and Clandinin (Canada), my direct intellectual predecessors, and supported those findings with what has more recently emerged in my own research program as a Canadian studying teacher learning in American school contexts for more than a decade. I also wove in views of other researchers who helped set the context for why the teacher-as-curriculum-maker image is so vitally important. In conclusion, I tie together some major consequences having to do with (1) the boundaries between the two images of teaching, (2) the critics of the teacher-as-curriculum-maker image, and (3) the teacher-as-curriculum maker image and its relationship to teacher education along the continuum.

The prevailing image of the teacher-as-curriculum-implementer dominating the reform, administration, and some teaching research literature, significantly runs against the grain of the image of the teacher-as-curriculum-maker, diminishing its possibilities as a viable lived alternative. At the same time, the dualistic ways the two images are portrayed is not helpful. Boundaries do exist between the teacher-as-curriculum-implementer and the teacher-as-curriculum-maker. These boundaries, however, are not discreet. Ideally, they are porous, with opportunities for ideas and practices to flow freely and reflexively between them. Furthermore, teachers in the curriculum-making role are not totally oblivious to policy makers' mandates. They are, for the most part, working diligently to incorporate what makes sense for everyone within the given contingencies of their teaching situations. Hence, more fluid inquiries need to be conducted that focus on the ways prescribed formal knowledge and developing informal (practical) knowledge productively intersect. Here, I would include such perceived anomalies as the direct ways that reflective practice has been taught and the indirect ways that formal knowledge is successfully encountered in teacher development experiences. To me, there is a great deal more to be unpacked here and the international research community has not yet plumbed its depths.

The second residual point has to do with critics and their criticisms. At the 2009 American Educational Research Association Meeting, a Middle Eastern colleague shared his impression that work involving the teacher-as-curriculum-maker image/Schwab's 'practical' is currently considered "old-fashioned." In my view, the comment was prompted by (1) the historical dominance of the curriculum-implementer image, (2) the fact that, in the traditional paradigm, teacher/learner hierarchies trump concern for human experience, and (3) the idea that critical theory is not invoked as an *a priori* framework, but rather when storied teacher experience warrants its presence. My immediate response was: "How could classroom/field-based research ever be considered old-fashioned?" For me, the argument that practical teaching inquiries are outdated modes of inquiry suggests the possibility of ignoring the lived realities of curriculum making itself as well as the dynamic interactions of teacher, learner and milieu through which learning is daily negotiated, enacted and experienced. When I reflected on the exchange later, I realized I had had a vicarious brush with what Schwab (1969) termed a "flight from the field" to theory—or to what currently is the move to abstract empiricism. The systematic avoidance of the authentic, contextually aware and richly informed knowledge of practitioners in the field serves to further fuel the relentless appropriation of the 'learning community' model for top-down professional development, complete with predetermined outcomes for teacher knowledge and measurable indicators of student success. Such an approach ignores the complexities of learning itself, including the need to be attentive to learners and teachers alike.

This experience reminded me of an article authored by Cremin (1953) entitled "The curriculum maker and his [sic] critics" in which Cremin argued that those in higher education need to learn to deal with the "apathetic and lunatic fringe within our ranks as well as the attackers outside." It was startling to realize that then, as with now, the greatest risk to the teacher-as-curriculum-maker image probably lie within the academy. This insight brought to mind William Butler Yeats' poem, *Toward break of day*, which specifically discussed "things fall[ing] apart" in such a way that "the centre cannot hold…." Given what has been perilously happening on the world stage in politics, business, the environment, the economy, education, and research, I recognized that my inability to respond directly to the rhetoric of teacher experience as irrelevant contributed as much to "the centre not holding" as the critic's biting remark. Those conducting teaching and teacher education research need to consciously cultivate ways to co-exist so that some findings from academic inquiries make their way into policy deliberations, which most assuredly affect the lives of flesh-and-blood teachers and students. Otherwise, all of our research—through mutual canceling out—will continue to be rendered useless.

Finally, I focus attention on the teacher-as-curriculum-maker and teacher learning along the continuum. While at the International Study Association of Teachers and Teaching (ISATT) Conference in Australia in 2005, I attended a teacher education session hosted by Finnish researchers. I was amazed to discover that they were using a similar narrative assignment to what Connelly and Clandinin described as 'the curriculum of life' in their 1988 book, a narrative approach that I personally have adapted and used—with much student satisfaction—in the master's and doctoral degree level courses I teach. Not only were the Finns enacting the assignment, which they called 'rivers of life,' in their teacher education classes, but they were systematically developing and adapting the work throughout teachers' careers as they unfolded over time. While language initially prohibited me from reading what the Finnish preservice teachers had to say in the exemplars featured, I was still able to intuit how powerfully self-revealing and professionally useful it would be to experientially build on something so infinitely profound over teachers' life spans. For me, this represented a powerful example of the teacher-as-curriculum-image being intentionally lived over the continuum of teachers' careers.

Not only does this story capture my point, it directs attention toward future work required in the field. Pedagogies that assist in the cultivation of the teacher-as-curriculum-maker image must be shared like Connelly and Clandinin and the Finnish researchers have done. To their examples, I would add the book, *Narrative inquiries in curriculum-making in teacher education,* edited by Canadians, Kitchen, Ciuffetelli Parker, and Pushor (2011). I would also include the collaborative work of Li (U.S.), Conle (Canada), and Elbaz-Luwisch (Israel), which centers on shifting polarized positions (Li, Conle & Elbaz-Luwisch, 2009), a major challenge encountered not only in education classes, but increasingly around the world as meta-narratives that pigeon-hole human differences increasingly rule. There is no doubt that many leading international researchers (i.e., Ben-Peretz, 2009; Cochran-Smith & Zeichner, 2005; Cochran-Smith & Lytle, 2009; Grimmett & Chimmery, 2009; Kwo, 2010) point to the teacher-as-curriculum-maker image as the illuminative path through the current educational malaise and call for its elaboration in fine-grained detail. Marking that territory will continue to be a professional imperative and a personal honor

Abstract: This paper constructs six principles of practice for teaching teachers, using a collaborative self-study methodology to analyze data collected over a period of 6 years. We use the concept of the authority of experience as a central perspective from which to construct principles of practice. Data are drawn from our shared and individual experiences as teachers of physics curriculum methods courses at our two universities. Our central focus is on the goal of teaching new teachers to think pedagogically in order to create contexts of productive learning for their students. Particularly informative were data gathered from individual and focus-group interviews with five teacher candidates conducted by one of us in a class taught by the other. We conclude by acknowledging several tensions that continue to challenge us as we work to focus our teaching on big-picture issues of teaching and learning.

Keywords: pre-service teacher education, experience-based principles, thinking pedagogically, self-study

INTRODUCTION

This paper constructs six principles of practice for teaching teachers from our shared experiences (2005-2011) engaged in collaborative self-study of our practice teaching physics curriculum methods to teacher candidates. These collaborative self-studies began with the commencement of Shawn's Ph.D. studies with Tom as his thesis supervisor. Conscious of Shawn's intention to pursue teacher education in both research and practice, Tom encouraged a collaborative self-study during the doctoral program to enable both of us to identify and explore our assumptions about teaching teachers. In 2005-2006, we shared a teaching arrangement where Tom was the teacher of record for the first half of the year and Shawn for the second half of the year, while Tom was on leave. In 2006-2007, we shared responsibility for teaching the physics methods course while Shawn developed his research questions for his thesis. In 2007-2008, Shawn was a participant-observer in Tom's class while also interviewing five teacher candidates from Tom's class about their course and practicum experiences. The final year of Shawn's Ph.D. studies (2008-2009) found us returning to team-teaching and enacting pedagogical approaches based on findings from the research conducted a year earlier.

We now teach in different universities and continue our conversations about teaching teachers in yet another variation on self-study. We find the concept of developing a principled approach (Ambrose et al., 2010; Kroll et al., 2005) to our practice of teaching future teachers to be a particularly productive way of looking back over our years of collaborative self-study. This paper analyses and interprets our 6 years of self-studies with a view to articulating principles of practice for teaching future teachers. In doing so, we take seriously the calls by Zeichner (2007) and Loughran (2008, 2010) to both "accumulate knowledge" across self-studies and to "go beyond stories" of personal practice to develop principles that have epistemic import. We use the concept of the authority of experience as a central perspective from which to construct principles of practice.

METHODOLOGY

Self-study is not a prescriptive methodology (LaBoskey, 2004; Loughran, 2005; Pinnegar & Hamilton, 2009), as self-study researchers draw on a variety of research methods. Self-study provides an important framework for the development of professional knowledge about teaching teachers (Bullock, 2009a). Although the term *self-study* might well bring to mind images of solitary researchers thinking deeply about their practice, an important feature of many self-studies is critical friendship with a trusted colleague (e.g., Schuck & Russell, 2005). Costa and Kallick (1993, p. 50) defined a critical friend as "a trusted person who asks provocative questions, provides data to be examined through another lens, and offers critique of another person's work." In our opinion, it is critical friendship that allows self-study methodology to move beyond good-news stories of practice toward a deliberate analysis of pedagogy. A recurring emphasis in self-study literature is the problematic and unexpected features of practice, as self-study methodology "looks for and

requires evidence of reframed thinking and transformed practice of the researcher" (LaBoskey, 2004, p. 859). We continue to find LaBoskey's (2004, pp. 859-860) four methodological considerations for conducting a self-study to be useful guideposts for our research:

    f.   Self-study is aimed at identifying and reframing problems of practice encountered by the researcher with a view toward improving his or her own pedagogy.

    g.   Self-study challenges the researcher's tacit understanding about teaching and learning by encouraging interaction with colleagues, students, and educational research.

    h.   Self-study generally employs multiple, usually qualitative, methods that are used in the broader education research community as well as qualitative methods that are unique to self-study research.

    i.   Self-study should be made available to the broader education research community for the purpose of consolidating understanding and suggesting new avenues for research.

Our paper synthesizes and interprets the results of collaborative self-studies that we have conducted since 2005. In response to the challenge issued by Zeichner (2007) to "accumulate knowledge across self-studies", we look critically at our work with a view to suggesting principles of practice for teaching teachers. We accept the view of Kroll et al. (2005) that principles offer a dynamic alternative to the more traditional idea of propositions, because principles are understood to suggest future directions and contextual understanding rather than objective truths. To that end, we offer six principles, supported by warrants developed from relevant literature and from 6 years of collaborative self-study.

SIX PRINCIPLES OF PRACTICE FOR TEACHING TEACHERS

Learning to think pedagogically is at the core of learning to teach.
As a teacher educator, it is easy to assume that a methods course should focus on ensuring that those learning to teach understand fully and accurately the content of the curriculum they will teach. It is also easy to assume that recommended practices will be adopted by new teachers once they have been made aware of those practices, typically by reading about them and being told. It took many years of listening to those learning to teach and reviewing our own practices as teacher educators to realise that the central focus of a pre-service teacher education program should be on developing the ability to *think pedagogically*. Teachers teach the content of various disciplines to their students; teacher educators must teach their students what it means to think like a teacher. While this always involves working with the subject matter of the curriculum and various disciplined perspectives on education itself, *analysing the relationship between teaching and learning in disciplined ways does not come naturally.* Developing the ability to think pedagogically must begin in pre-service teacher education, to initiate a perspective that will continue to develop over a career. Books such as Loughran's (2010) *What Expert Teachers Do* provide excellent support for helping new teachers to think pedagogically.

Learning to think pedagogically is neither obvious nor intuitive for teacher candidates; most have spent a lifetime observing teachers with little incentive to think carefully about why teachers behave as they do. As a result, most teacher candidates come to a Faculty of Education able to do reasonable impressions of how a teacher acts in a classroom. Nevertheless, they tend to be unable to see clear connections between particular teaching strategies they might use and the effects those strategies might have on a students' learning. In short, they are unable to think pedagogically.

Data from a collaborative self-study that we conducted in 2007-2008 uncovered many of the challenges candidates face in thinking pedagogically. That year we decided to enact a pedagogical approach grounded in lesson study (Stepanek, Appel, Leong, Mangan, & Mitchell, 2007) that provided an opportunity for every candidate to plan a lesson in a small group, and for representatives of each group to teach the lesson twice (with the second version of the lesson to be developed according to peers' feedback on the first version). Early in the process it became apparent that candidates were having difficulty providing feedback to peers in ways that were different from suggestions that might be made by associate teachers. Tom called attention to the difficulties they were experiencing shortly after the first lesson study, stating that "a lot of this [peer feedback] reads like 'do X instead of Y.' What I am struggling with is that we haven't named the learning effects. . . . Can we get better, individually and collectively, at naming the learning effects?" (Russell & Bullock, 2011, p. 26). Although Tom continued to encourage candidates to frame their comments in terms of teaching strategies and learning effects—to think pedagogically—many candidates actively resisted the process. We noted:

Several teacher candidates argued that there was merely a semantic difference between making a statement such as "do X instead of Y" and making a statement such as "the teaching strategy affected my learning in X ways." (Russell & Bullock, p. 26)

After continued prompting, we both noticed that the second round of lesson-study presentations prompted candidates to enact slightly riskier pedagogical approaches and to speak more openly about the effects that particular approaches were having on their learning. Overall, though, we concluded that the gains were marginal, largely because requiring a teacher candidate to teach a lesson to peers early in the year requires them to take considerable risk. In hindsight, we realized how much we were asking of teacher candidates. We were asking them to create a whole new language for talking about teaching when they were still struggling to make sense of their deeply-rooted default teaching moves.

Recognise the significance of the first class as a unique opportunity to challenge prior views of teaching and learning by making powerful and unexpected pedagogical moves that engage teacher candidates and stimulate conversation about pedagogy.

Shawn's first memory of Tom's physics class is the way it began by focusing on a shared classroom experience rather than reading through a course outline and discussing the required assignments. Tom engaged the class both in thinking about physics and in thinking about how to teach physics by using Predict-Observe-Explain (POE) pedagogy (Baird & Northfield, 1992). The procedure is familiar to many science teachers and science teacher educators: A situation is presented to a class and students are asked to make predictions about what will happen, record observations, and suggest explanations. At first the process may seem to be both a metaphor for the scientific method and a way of engaging students in learning to think scientifically.

We have come to believe, however, that POEs transcend an investigation of scientific concepts and go a long way to creating what Sarason (1996, p. 37) has called a "context of productive learning." A context of productive learning emphasizes shared intellectual control between teachers and students and an environment that is conducive to taking risks. Candidates in our physics methods courses typically come from undergraduate degrees such as physics, mathematics, and engineering and they tend to overestimate their conceptual understanding of basic Newtonian physics. POEs help call attention to some of the gaps in their undergraduate learning, with a view to emphasising the importance of exploratory, hypothetical talk rather than stating the correct explanation. POEs are often designed to highlight an unexpected result. We have found that the shared experience of building an incorrect prediction and finding ways to talk productively about how someone might be thinking if they made a particular prediction are early ways to signal our intention of creating a productive classroom environment.

In addition to challenging the cultural tradition of focusing on administration during the first class, beginning the physics methods course with a POE allows Tom to begin developing a relationship of mutual trust. Although candidates may believe initially that the point of a POE is to test their physics knowledge, the way Tom sets up POEs and the subsequent discussions helps to shift candidates' focus toward their learning during the POE process. Candidates are also encouraged to think about how a secondary school student might be thinking during a POE. The following excerpt from data collected at the beginning of our 2006–2007 methods class and first reported in Bullock and Russell (2009) reveals the typical way that Tom begins the year:

> Tom: If someone thought that the mirror would make the light brighter, how might that person explain that prediction?
> [Responses from teacher candidates]
> Tom: Notice that every answer you give is a right answer, because I can't argue with how someone might be thinking. Now, if someone thought that the mirror would make the light darker, how might that person explain that prediction?
> [Responses from teacher candidates]
> Tom: I am going to ask you to do something that will feel strange. Please close your eyes and raises one hand in a fist. When I say that prediction you wish to vote for, please open your hand so that I can count you. [Tom counts the votes for each prediction and then asks people to open their eyes]. That's the wonderful thing about POEs; everyone has taken university courses in physics, yet look at the range of responses.

[Tom moves the mirror in front of the light, revealing that that correct prediction depends on where the candidate's eyes are in relation to the angle of the mirror; for everyone, the area in question appears darker because the direct reflection is on the ceiling.]

Tom: How did that experience make you feel as a student? As you go through the year, remember that school is often a house of right answers. How long does it normally take you to conclude that you gave a wrong answer to a teacher? Most students know in an instant. One of the biggest challenges is how we tell students their answer is wrong. *Conducting a POE means that we don't have to tell students that they are wrong.*

The purpose of doing a POE in the opening minutes of the first class is to send a message: A physics methods classroom can be a safe learning environment in which individuals can offer opinions without fear of being judged as providing a wrong answer. As Holt (1964) observed, the fear of failure dominates many students' experiences of schooling. Post-secondary education is no different, for there is powerful and well-leaerned desire to give the right answer and please the teacher. Tom was careful to form his questions so that teacher candidates could hypothesize about how someone *might* support a prediction without stating how they personally would explain their own predictions. In this way, Tom indicated that he was interested in exploratory thinking and risk-taking rather than in passing judgement on the candidates' background knowledge in physics. Although we believe that Predict-Observe-Explain is both a powerful pedagogy to use in physics classrooms and a useful touchstone for candidates to begin thinking about the messages we are trying to get across, the broader purpose for beginning with a POE is to initiate a productive relationship with teacher candidates.

Teachers new and old are unlikely to adopt new teaching procedures unless they have experienced those procedures themselves and analysed the effects on their own learning.

Most teacher educators are aware of Lortie's (1975) concept of the *apprenticeship of observation*. The phrase has a certain initial plausibility, as we have all observed our own teachers through countless hours of schooling. Because pre-service teachers have little or no experience of teaching, it is easy to assume that they are empty vessels waiting to be filled with the wisdom of teacher educators' own teaching experiences. Thanks to the growing attention to the importance of working with what children already know, we began to understand how and why telling people new ways to teach has minimal impact on how they teach. Only by experiencing new pedagogical approaches personally and then analysing those experiences systematically can we begin to overcome the tendencies of all teachers and teacher educators to teach as they were taught.

The familiar language of *theory into practice* makes it easy for every teacher educator to assume that words will be sufficient to change practices, yet teaching is one of the most difficult practices to change. What we consider to be normal or appropriate is shaped in powerful ways by our own teachers' practices. Anything different makes us uncomfortable and is also likely to make our students uncomfortable. As Macdonald (1973, as cited in Stenhouse, 1975, p. 170) put it, "Genuine innovation begets incompetence. It de-skills teacher and pupil alike, suppressing acquired competencies and demanding the development of new ones."

Reflective practice involves much more than everyday meanings of the word *reflection*. Teacher educators need to teach people how to reflect and to model explicitly their own reflective practices.

Tom's interest in and understanding of the concept of reflective practice (Schön, 1983) was enriched by opportunities to hear Schön lecture at Queen's in 1984 and 1987. Those lectures inspired Tom to build a research agenda on the concept of reflective practice and to focus his research on teacher education generally rather than on teacher education in science. Reflective practice goes well beyond everyday meanings of reflection and focuses on learning from professional experience. Before we can teach others the meaning of reflective practice, it is essential to understand reflection from the perspective of our own professional learning from experience as teacher educators. Analysis of Tom's interviews of his physics methods students in 1992-1993 inspired the concept of the authority of experience (Munby & Russell, 1994), which calls attention to the fact that experience can have authority that may compete with and override the authority of reasoned arguments or the authority of position associated with an experienced teacher's advice to a novice.

The professional relationship between teacher candidate and teacher educator is crucial to the teacher educator's influence on how a teacher candidate will teach.

In one of the first sociological studies of teaching, Waller (1932/1961) argued that schools play a significant role in the transmission of cultural norms, particularly because school culture is characterized by "complex

rituals of personal relationships" (p. 103) between people who engage in a variety of rituals and ceremonies. One of the most familiar ceremonies requires students to sit and listen attentively as a teacher stands at the front of the room and talks about curricular content. Tom disrupts this familiar teacher-student relationship on the first day of the methods course by challenging teacher candidates to take an active role in their learning during predict-observe-explain pedagogy. Bain's (2004) discussion of how the best university teachers treat their students led Tom to renew his attention to the importance of my professional relationship with each person he teaches. This principle is at the core of our professional relationship with each other, a relationship that began in 1997-98 when Shawn was a student in Tom's class and we subsequently published an analysis of that early relationship (Russell & Bullock, 1999).

Our continuing interest in the power of Predict-Observe-Explain pedagogy led us to connect the importance of creating a safe classroom environment with an early and explicit focus on developing a productive relationship with teacher candidates. Another significant way that we build a relationship with teacher candidates is through anonymous feedback that we collect using both index cards and the affordances of course management software. Making "Tickets out of Class" a regular feature of the last few minutes of every class reveals the main messages and questions that candidates are grappling with. As Tom noted, "I have always thought that my teaching required listening to my students and asking them to play back to me the effects of my teaching on their learning" (Russell, 2007, p. 184). Asking candidates to quickly write down a few thoughts about the class has proven to be a simple yet effective way to think about how candidates perceive our teaching. Candidates have also spoken about the efficacy of tickets; one person from our 2008–2009 class offered the comment that "tickets leave us thinking after class." We continue to be fascinated by the diverse range of ideas that candidates take from a given lesson. This reminds us of the significant gap between what the teacher wants from a lesson plan and what the students get out of a lesson. The challenge, for us, is to try to keep that gap as small as possible.

In September, 2009, Tom did something he had never done before, inviting each student (in a class of 16) to meet with him for 20 minutes between the first and second class. His insight into the power of this principle was immediate when he arrived at that second class and realised how different it felt from the first, because he knew each person's name and something about her or him. That early one-on-one meeting paid rich dividends throughout the year. The inspiration for this practice came directly from Shawn's analysis of data he collected for his thesis research. The price in time is high, and the rewards are equally high. Tom has continued and extended the practice by meeting individually with each student (23 in 2010-2011) after the first and second practice teaching experiences. He is struck by the number of students who thank him for the opportunity to meet individually for the purpose of reviewing their professional progress.

Every teacher candidate takes a uniquely personal set of messages from the shared experiences of an education course. The single most important influence on what candidates take away is the tacit knowledge of teaching and learning that they bring from many years watching their own teachers.
Shawn's study (Bullock, 2009b, 2011) of the learning experiences of five candidates in the physics methods course in 2007-2008 forced us to abandon the easy assumption that, if all students experienced the same classes, then they all left with roughly the same messages and understandings. Data from 4 focus groups and 20 individual interviews, conducted at intervals during an 8-month preservice program, illustrated how each individual arrives with a unique set of assumptions about teaching and learning; the data forced us to conclude that each individual leaves with a similarly unique set of understandings in response to the learning experiences that are created in the class. In hindsight, we realized that at least part of the difference between the messages that teacher candidates take from their methods courses arises from the different experiences they have had observing teachers over many years as students.

Renewed attention to the many dimensions of the apprenticeship of observation linked with the evidence from Shawn's research focussed our thinking on the uniqueness of what each candidate takes from shared class and program experiences. Data gathered during the 2007-2008 academic year indicated that teaching and learning experiences in the physics methods course stood in sharp contrast to candidates' school experiences prior to the pre-service program and also in sharp contrast to what they observed during their practicum placements. The candidates were affected in different ways by the teaching strategies used in their physics course, but they agreed overall that the course was a non-traditional educational experience that differed significantly from their initial expectations. One candidate called attention to the importance of starting off a course by building a strong relationship:

> I found that teachers who establish an environment of trust, they're given a break compared to individuals who haven't. . . . [If] you start down the wrong path you're never going to get off it. It's

important to start things the right way, or start out the way that you want the class to go . . . establish the class environment that you want for the semester and model it. (Bullock, 2009b, p. 136)

Another candidate highlighted the foundational importance of relationships in teaching:

> Working towards the relationship is pretty integral. It's not just sort of like a helpful thing, like "This will go better if you like me" or "You'll listen to my lectures more if you think I'm a fun person." But more that that relationship is actually a specific part of the teaching, and that if that relationship's not working, then there's some kind of failure there on someone's part. (Bullock, 2009b, p. 136)

These two candidates viewed the relationship that Tom cultivated with his students as more than a nicety that made coming to class pleasant; it was a specific, foundational part of his teaching. Significantly, when asked what they learned from the physics methods course that was unique compared to the rest of their teacher education program, these same two teacher candidates bluntly replied: "How to teach" (Bullock, 2009b, p. 219). Although he did not want to come across as a "Tom cheerleader," one of the candidates explained: "What I mostly learned from physics class was just the way Tom taught" (Bullock, p. 224). The other four candidates echoed his statement, albeit in different ways. Some candidates were impressed by the range of active-learning pedagogies, such as POEs, used in the methods course, particularly when those pedagogies caused them to rethink how they learned. Other candidates took an early interest in how Tom cultivated his relationship with the class. By the end of the course, each of the five candidates agreed that *how* Tom taught was in fact the content of the methods course, and that the way he taught was predicated on a strong relationship with the class founded on mutual trust.

The 2008–2009 methods course was markedly different from the previous 4 years due to a cluster of candidates whose initial school experiences were in countries from which they later moved to Canada. These candidates compelled us to recognize yet another layer of significance in the apprenticeship of observation, namely, that our own apprenticeships of observation made it easier to predict the assumptions that candidates would have about teaching and learning from their apprenticeships, *provided that they also went to school in Canada.* This extra layer of complexity seems particularly relevant to future research into the effects of the apprenticeship of observation on teacher candidates' prior assumptions about teaching.

CONCLUSION

As we work to help teacher candidates learn to study their own development as learners and as teachers, studying our own practices has become an increasingly important part of giving genuine meaning to reflective practice and constructivist teaching approaches. We believe that characteristics of self-study such as critical friendship and reflection-in-action make sustained collaborative self-studies an important tool to help teacher educators to examine the assumptions underlying their practices and critical features of their pedagogy. Studying our own practice is not an end in itself but a driving force for reframing how we think about our practice in order to develop new, more engaging and productive practices.

By creating a context of productive learning with teacher candidates in their preservice year, we conclude that we can also create a strong potential for meaningful dialogue as the candidates enter the teaching profession. One of the inevitable challenges is that each new group of candidates has not shared with us the events that led to the new practices we develop. This reminds us of the importance of being explicit with candidates about why we believe that specific practices with which they may be unfamiliar or uncomfortable are relevant to their professional learning as they experience the transition from student to teacher.

In closing, we repeat the six principles of practice, this time without discussion so that they may be viewed as a set of principles rather than as individual ones.

1. Learning to think pedagogically is at the core of learning to teach.
2. Recognise the significance of the first class as a unique opportunity to challenge prior views of teaching and learning by making powerful and unexpected pedagogical moves that engage teacher candidates and stimulate conversation about pedagogy.
3. Teachers new and old are unlikely to adopt new teaching procedures unless they have experienced those procedures themselves and analysed the effects on their own learning.
4. Reflective practice involves much more than everyday meanings of the word *reflection*. Teacher educators need to teach people how to reflect and to model explicitly their own reflective practices.

5. The professional relationship between teacher candidate and teacher educator is crucial to the teacher educator's influence on how a teacher candidate will teach.
6. Every teacher candidate takes a uniquely personal set of messages from the shared experiences of an education course. The single most important influence on what candidates take away is the tacit knowledge of teaching and learning that they bring from many years watching their own teachers.

We see these as a set of principles grounded in our practice and subject to rigorous, ongoing, critical analysis through collaborative self-study. To further highlight the fact that these principles are dynamic works-in-progress, we offer some of the tensions that continue to challenge us as we develop, critique, and reframe our pedagogies of teacher education:

1. Each year we work with new groups of teacher candidates who are unique both as individuals and as a group. How do we adapt what we have learned from working with groups of candidates over a number of years while acknowledging that new classes only experience the methods course once?
2. How do we continue to find ways to help candidates quickly and continuously identify their prior views about teaching and learning acquired in their apprenticeships of observation?
3. How can we improve our ability to listen actively to our teacher candidates' individual concerns and work with them to track their progress through the year?
4. Teacher educators and teacher candidates often find it difficult to enact new and unfamiliar pedagogies that are consistent with their vision of the kind of teacher they want to become. How do we turn this challenge to our advantage in a methods course?

Both the culture of school and the related culture of a Faculty of Education can easily mask the big-picture issues of teaching and learning. How can we call attention to these big-picture issues when the pragmatic needs and concerns of teacher candidates often feel so visceral and immediate?

258 - The Impact of Organizational Climate in Schools on the Transfer of Post-initial Master Studies

Marco Snoek

School of Education, Hogeschool van Amsterdam
university of applied sciences, The Netherlands
M.Snoek@hva.nl

Abstract: In the ambitions to upgrade the teaching profession, much attention is given to Master's courses for teachers. As such Master's courses asks for considerable investment in time and money, the question can be raised to what extent the upgrading of teachers to the Master's level will lead to improvement in teaching and learning at schools.

This paper presents the outcomes of a small scale study in which 7 teachers who recently graduated at a Master's program in the Netherlands were interviewed on the climate and conditions they experienced at the workplace in their schools to apply their newly acquired knowledge, skills and professional attitude in their daily work.

This explorative study shows that teachers engaged in a Master's program can meet considerable obstacles within the organizational culture of the school. If they want to earn recognition outside the formal hierarchy of the school, they need to fight these barriers.

Keywords: teacher development, Master's programs, training transfer, organizational culture

INTRODUCTION

In European policies that aim to increase the quality of teachers, much attention is given to the upgrading of qualifications. The Bologna process has stimulated the development of a higher education area with qualifications at Bachelor's and Master's level. In response to the European Council's conclusions on 'Increasing the Quality of Teacher Education' (European Council 2007), many member states have started policies to raise the overall qualification level of teachers. However, the strategies that are used by member states vary. Some member states have decided to raise the minimum qualification level for teachers to Master's level. In other countries the initial qualification level for (part of the) teachers remains at Bachelor's level, while new post-initial courses are developed to create in-service opportunities for teachers to raise their qualification to Master's level. Although this second strategy, focusing on in-service Master's qualification programs, seems less ambitious than the first strategy aiming at ensuring a Master's qualification for all new teachers, the second strategy is important as it focuses on the vast amount of teachers that already work in schools.

The ambition to increase the number of Master qualified teachers requires a considerable effort in time and money. In the Netherlands, the government has initiated a bursary system in which teachers can apply for financial support to follow an in-service Master's qualification course. This support both covers (part of) the annual study costs to a maximum of 3500 Euro and replacement costs for 160 hours per year with a maximum duration of three years (figures of 2010). Until 2010 20.000 teachers applied for these study vouchers which involves an annual budget varying between 23 and 37 million Euro (Ministry of Education, Culture and Sciences, 2011).

This raises the question whether this large sum of money is well spent: to what extent will the increase of Master teachers in schools lead to improvement in teaching and learning at schools.

The impact of training on change at the workplace has been an area of extensive research (Blume et al., 2010; Burke & Hutchins, 2007; Baldwin & Ford, 1988). However, this research on 'transfer of training' mainly focuses on training designs related to daily work procedures and with short duration and low intensity (Blume et al., 2010). Master qualification courses for teachers in school generally have a much longer duration and higher intensity (typically one day a week during two or three years part-time). Therefore the application of the outcomes of research on training transfer to the context of master qualification courses for teachers can be questioned and an explicit study on transfer of master studies to the workplace is justified.

THE CONTEXT OF IN-SERVICE MASTER'S PROGRAMS IN THE NETHERLANDS

In the Netherlands, initial teacher education for teachers in primary and secondary education is provided by the universities for applied sciences ('hogescholen') at Bachelor's level (BEd). Teachers who wanted to upgrade their qualification could follow a postgraduate program at the universities for applied sciences. From 2006, these post graduate courses have been converted into in-service Master of Education (MEd)programs. In 2007 a new master's program was introduced: the MEd program *Learning and Innovation*, which prepares teachers to become an expert in teaching and learning and an innovator and change agent in school (Snoek & Teune, 2006). This MEd program started at several institutions between 2007 - 2010. A second initiative to raise the qualification level of teachers was provided by the Dutch Institute for Masters in Education (NIME), in which the boards of a number of secondary schools are represented. In 2008 they initiated a tender for universities to offer a MSc/MA or MEd Master's program focusing on teaching, innovation, practice oriented research and collegial support (Snoek 2011). Both of these Master's programmes focus on the one hand on the primary role of the teacher with respect to the learning of his/her pupils and on the other hand on the secondary role of the teacher that is connected to Hoyle's concept of extended professionalism (Hoyle & John, 1995; Scheerens, 2010; Snoek, 2011). As the concept of such Master teachers in schools for primary and lower secondary education is still very new in the Netherlands, there is little connection to explicit expectations towards the daily work procedures of master teachers.

EVALUATION OF TRAINING TRANSFER

As these master's programs require substantial investments, it is essential to evaluate their effectiveness. Kirkpatrick (1998) offers a training evaluation model with four levels: participant satisfaction, assessment of acquired knowledge and skills, application at the workplace and impact on the results and outcomes of the organization/company. Kirkpatrick's model emphasizes the actual aim of the training: to have an impact on the outcomes of a company or organization. However, most evaluation instruments focus on participant satisfaction (level 1) as the higher levels in Kirkpatrick's model are more complex to measure. Although Kirkpatrick's model might help to change the focus from participants' satisfaction to actual impact, the model has also been criticized for being too simple as the causal relations between the levels can be questioned and intervening variables that affect outcomes are not taken explicitly into account (Holton III 1996). In the literature on training transfer a wider perspective is used, based on Baldwin and Ford's model for training transfer (Baldwin & Ford, 1988). In their model, transfer of training is defined as the extent to which the learning that results from a training experience transfers to the job and leads to meaningful change in work performance (Blume et al., 2010). Baldwin & Ford's model focuses on the third level of Kirkpatrick's model and provides more detail. In their model, three negotiating elements are identified that have impact on the transfer of training and therefore on the impact of the training on the outcomes of a company or organization. Not only training design factors (e.g. objectives, methods and opportunities for practice) will have an impact on the actual application of learned competences or skills at the workplace, but also trainee characteristics and work environment factors play an essential role in the application at the workplace. Trainee characteristics deal with ability, skills and personality of the trainee, but also with their motivation to apply the learned competences and skills in their daily work. Work environment factors deal with characteristics of the work place and the extend in which the organizational culture invites trainees to apply the learned competences and skills. According to Bunch (2007), much of the effectiveness literature focuses on training design, content and evaluation, but there is 'little recognition of the entrenched values, beliefs, assumptions [at the workplace] that prevent effective training' (Bunch, 2007, p. 145). Bunch emphasizes that positive change will require organizational support. Arthur et al. (2003) emphasize 'environmental favourability' as 'the extent to which the transfer or work environment is supportive of the application of new skills and behaviours learned or acquired in training' (Arthur et al., 2003, p. 242).

INDICATORS OF ORGANIZATIONAL CLIMATES THAT STIMULATE TRANSFER OF LEARNING

Indicators that are identified as predictive factors for positive transfer include strategic alignment between the training program and the strategic direction of the organization, cues that prompt trainees to use the learned knowledge or skills, opportunities (or constraints) to use the learned knowledge or skills, social support and feedback from supervisors and peers, accountability for using the newly acquired knowledge, skills and attitudes and cultural cues that have to do with the (implicit or explicit) importance that is given to training and professional development (Rouiller & Goldstein, 1993; Burke & Hutchins, 2007; Baldwin & Ford, 1988; Clarke, 2002; Tracey & Tews, 2005; Holton III, Bates & Ruona, 2000). An elaboration of these indicators for an organizational climate that supports training transfer is given in table 1.

Table 1: Indicators for an organizational climate that supports training transfer

Main indicators	Sub-indicators	Source
Strategic alignment between the training program and the strategic direction of the organization		(Burke and Hutchins 2007)
Situational cues that prompt trainees to use the learned knowledge, skills and attitudes	Work routines that emphasize the need to apply new knowledge and skills recognition and reward systems and career paths Accountability for using the newly acquired knowledge, skills and attitudes	(Baldwin and Ford 1988; Rouiller and Goldstein 1993)
Opportunities (or constraints) to use the learned knowledge, attitude and skills	A reduced workload to practice new skills The time interval between training and opportunity to perform Match between training content and trainee's work role Available equipment Autonomy to adapt work procedures to newly acquired competences	(Blume et al. 2010; Baldwin and Ford 1988; Clarke 2002; Lim and Morris 2006; Mikkelsen and Grønhaug 1999; Bartram et al. 1993)
Support and feedback by peers and supervisors	Social support and expectations from supervisors Feedback of supervisors Involvement and participation of supervisors in training Discussions with supervisors on the outcomes of training Support from peers	(Baldwin and Ford 1988; Clarke 2002; Tracey and Tews 2005)
Cultural cues with respect to the importance of training and continuous learning as supported by behavioural norms	Voluntariness of training Training seen as an expense or an investment The position and focus of HRM within the organization	(Bunch 2007, Tracey and Tews 2005; Clarke 2002)

FOCUS AND METHODOLOGY OF THIS STUDY
Context and relevance

Given the fact that transfer of training outcome to the workplace is not a self-evident process and the fact that in-service master courses require a considerable investment in time and money, it would be '*unwise to implement new training programs if the work environment does not adequately prepare trainees for the learning process or support the use of newly acquired knowledge and skills on the job when trainees return to their jobs'* (Tracey & Tews, 2005, p. 354).

In this study we look deeper into the transfer conditions that participants at an in-service master's qualification program experience during and after their study. The context of this study is a master's program offered by the Hogeschool van Amsterdam and supported by the Dutch Institute for Masters in Education NIME. This master's program started in February 2009 and in January 2011 the first group of 7 participants graduated. This master's program differs from other master's programs as it has been initiated by school boards in secondary education. At the request of the school boards, the master course is not government funded. This creates a fundamental difference with other master programs. In the government-funded master programs the study is based on a contract between the participant and the teacher education institute, while the NIME-master is the result of a tri-partite contract between the participant, school board and the teacher education institute, guaranteeing the influence of the school on the content and quality of the program. As a consequence, the school boards have to cover the full fee and the costs for study leave (typically one day a week). Through this construction, active involvement and engagement of the school board and the supervisor of the participant is built into the model. Given this construction one might expect that the transfer of learned competences to the workplace is facilitated and supported by the school. On the other hand, the construction requires new roles and relations between participants, schools, and tutors at the master programs to adapt to this new context. As a consequence, transfer of training might not be as self evident as the design seems to suggest.

To evaluate whether the design supports successful transfer of learned competences to the working place, a small scale research study was conducted focusing on the first graduates of the program, on their experiences with applying the learning competences to their daily work and on the factors that hindered or stimulated this.

Although the research population is small, the study has a wider relevance as it can not only provide insight into the effectiveness of the design, but it can also show to what extent the indicators for an organizational climate that supports trainings transfer are also relevant for the context of a prolonged and extensive course like a two years master's course and how these indicators work out in the context of a school organization with a high number of autonomous (semi-) professionals. Moreover, it can provide teacher education institutes and schools with guidelines that can support in creating conditions that stimulate transfer of the competences acquired during the master course.

Research design

The main research question for this study was: To what extent do the Master participants experience a supportive organizational climate that supports them to apply the learned competences within their school?

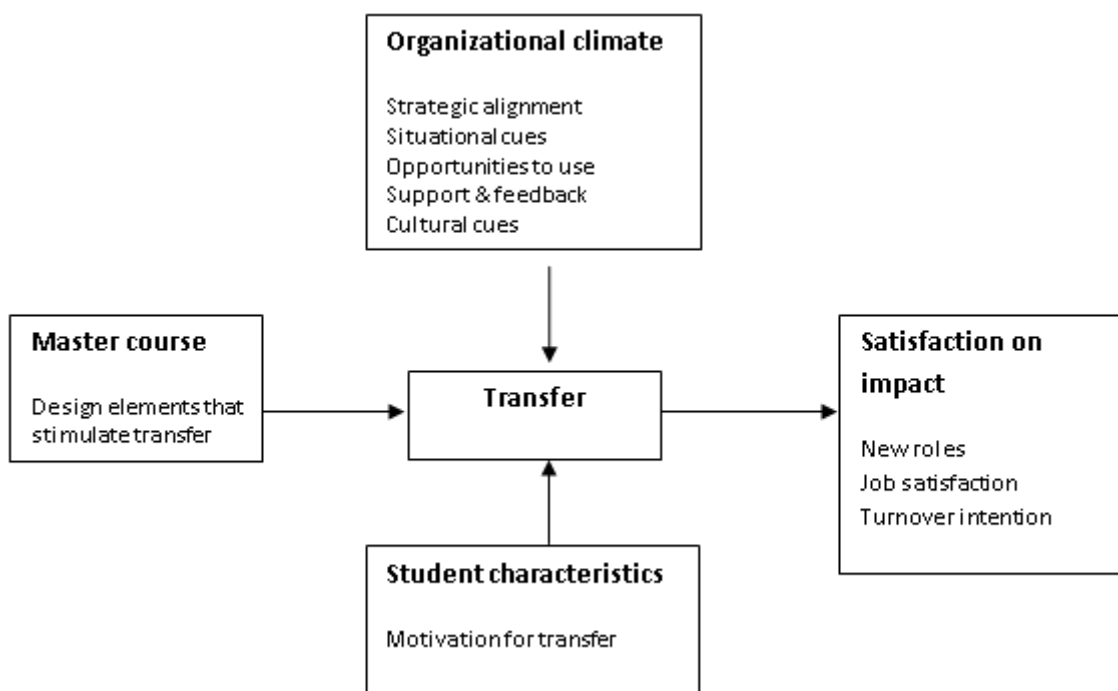
To answer this question, we need to take into account the three factors that influence transfer of training: the willingness and motivation of the participant to apply the learned competences to the working place (Egan, Yang, and Bartlett 2004; Noe 1986), the design of the course with respect to the way in which it actively stimulates transfer, and the organizational climate of the school. This last factor was broken down in separate subcategories, using the indicators for an organizational climate that supports training transfer as presented in table 1. Although the focus of our study is on the organizational climate, we need to take the other two factors into account, as they might influence the extent in which active transfer takes place. Indicators for the success of transfer of the learned competences are new roles or positions that the participants take up in the school, their job satisfaction and their intention to leave their jobs (turnover intention) (Egan, Yang, & Bartlett, 2004; Tett & Meyer, 1993; Noe, 1986). The resulting research model is summarized in figure 1.


Figure 1:Research model

Research methodology

As the aim of the study is to identify crucial elements in the organizational climate in schools that can help to improve the transfer of training outcome, we chose a qualitative design. This fitted also with the small

number of respondents. As the context for our study differs from the contexts in which the indicators have been validated (mostly for short training designs (Blume et al., 2010) and in commercial sector organizations (Clarke, 2002), it was necessary to be open to new elements that might influence training transfer of Master's programs in schools. Therefore we used semi-structured interviews. In the first phase that is reported in this paper, we interviewed the graduated participants two months after graduation, so the participant could reflect on the full program and on transfer aspects both during the Master's course and after graduation. In the second phase we will interview their supervisors.

The interviews were structured in such a way that the different elements of the research design were covered in the interview guideline. Each of the interviews was recorded, typed out and analyzed by the interviewer, using the elements of the research design (figure 1). The seven interviews were compared to draw general conclusions with respect to the extent in which the Master participants experience a supportive organizational climate that stimulates them to apply the learned competences within their school. In the second phase of this study, the participant interviews will be compared to the supervisor interviews to find similarities and differences in the perceptions of participants and supervisors.

Information on the program design was derived from the course documentation that was used in the accreditation process (Centrum voor Nascholing Amsterdam, 2010).

FINDINGS
In this paragraph we will present the outcomes of the data collection, following the elements of the conceptual model.

Design of the curriculum and planned transfer activities
The curriculum focuses on three key competences: *innovation and entrepreneurship*, where the participants develop a deeper understanding in processes of teaching and learning, that can be used to innovate the teaching and learning process; *research*, where participants develop their research skills through practice oriented design research on a topic that is of relevance to the school; and *inspiration*, where participants are stimulated to develop their role and attitude as change agent within the school and to support colleagues in processes of innovation.

Candidates for the Master's courses needed to provide a letter of support from their school leader, indicating that the school leader considered the candidate as a talented teacher in the area of innovation and entrepreneurship, research and inspiration and that they would support the candidate in their study.

To stimulate transfer, their supervisors are invited once during the course, to join a lecture, to be informed about the design of the curriculum and invited to sign a symbolic tripartite contract, explicating the role of each partner in the contract. One of the conditions for the acceptation of the research theme of the participant is support from their supervisor, who has to confirm that the research theme is relevant to the school. The assignments connected to the lectures are designed in such a way that the participants are stimulated to elaborate on the topic from the perspective of their schools resulting in an essay or other type of product that can be shared with their supervisor and colleagues. Every semester ends with an integrative presentation on the main themes of the semester and participants are stimulated to use this presentation in their own school to inspire colleagues.

Participant motivation for transfer of learned competences
In the interviews, all of the participants reported that their initial motivation was at a personal level: to reach a deeper understanding of their teaching and of the learning of their students. At the end of the course all participants were motivated to use the newly acquired competences within their teaching. All of them explicitly indicate their eagerness to share their knowledge with colleagues and to come to a more coherent teaching approach within their team or the school.

> *I realised that the things I heard during the master would be very interesting also for my colleagues. It opened up a whole new world which I was eager to discover. I wanted to share this: my colleagues had to know this*

Participant perceptions of the way in which the organizational climate supports transfer
For most participants signing up for the Master's program was their own initiative. Only two participants were explicitly invited by their school leaders to subscribe to this master. Six of the participants received a

more or less positive response. One participant did not receive a positive response as the program was not part of the formal portfolio of professional development activities that were supported by the school.

According to the participants, explicit policies concerning professional development hardly exist within their schools. In most cases participation in CPD programs is the individual initiative of teachers and a negotiation about costs is necessary.

No explicit expectations were expressed by their supervisors beforehand. Several participants mentioned that the lack of explicit expectation could be explained by the fact that the initial announcement of the program was rather vague. As a result both participants and school leaders had no clear image of what they could expect from teachers who had done this master's program.

The opportunities for participants at the master's program to use the newly developed competencies have largely been created by the participants themselves. All participants see ample opportunities to use their new competencies in the micro-context of their classroom and their work with pupils. They indicate that they have developed a stronger awareness towards individual needs of pupils and that they are motivated to use the outcomes of their research to improve their teaching or to develop their curriculum. Three participants have been engaged in projects or new roles where they are challenged to use their new abilities. They indicate that through these new roles their school leaders have created opportunities where they are challenged to apply their new knowledge.

All participants indicate that they try to use their new knowledge to inspire and challenge colleagues, but four indicate that this is not always welcomed within school cultures which are suspicious towards excellence.

> But there are also colleagues who were negative from the start. "Ridiculous, it costs lots of money, lessons are skipped, what does it have …?". One colleagues remarked "What can I learn from you?". Some people just don't want to learn. And I can understand why: They are just afraid. They have got their position now and are afraid to loose it.

Six indicate that they lack the formal position that gives them the recognition they feel that they deserve. Four participants indicate that they feel that they have to fight for recognition by school leaders by sending their essays, publications etc. One participants expresses the fear that after graduation it is 'back to normal' again.

> I have the feeling that I have to fight not to sink back into oblivion. After graduation I have the feeling "damn I'm all on my own."Everything goes back to normal, like nothing has happened. We've had our party, finished! But that may not happen, that can't be allowed. That is a waste of money, energy, time and expertise!

Two participants indicate that the lack of recognition is partly due to the fact that the master's program does not fit in the regular structure of teacher profiles within the school.

> My supervisor doesn't know the content of the study that I do. It isn't connected to a concrete task or role within the school, like a school counselor or special needs teacher. That is clear. But this course has a completely different content. I think that also the management is struggling with it: what kind of position do they have to give someone who has done a program like this.

Although all participants acknowledge that recognition within the school, either by colleagues or school leaders, is slowly growing, they do not have the feeling that they are held accountable for using their newly acquired competences. Only two of the participants that have new roles within their school feel that school leader and colleagues have new expectations towards their performance.

All participants were facilitated to follow the course: the school paid the course fee and gave them study time. The study leave was used to reduce the number of teaching hours, providing the opportunity to join course activities and to work on course assignments, but hardly left time for deliberate practice within the school.

All participants indicate that they have a large amount of autonomy when it comes to their lessons. In other areas, their autonomy is much more limited.

> *In and around my classes I have a large autonomy. But in areas outside this, I have very little autonomy. I really want that to be bigger. I still get every year an overview: "This is what you have to do". I'm done with that. I want more professional freedom.*

They can take initiatives concerning school or team wide activities, but it is not part of their job description. As a result three participants indicate that they hardly have the time to initiate initiatives that fit to their newly developed competences. One participant indicates that there is no time and opportunity for her to sit and discuss issues with colleagues.

> *What I actually need is more time with colleagues. When you know that we don't even have a weekly meeting moment, you can understand that most has to be done in the corridors and time in between classes.*

The three participants that have indicated that they have gained new roles within the school, indicate that they have autonomy to initiate things that go beyond their teaching role. One participant indicated that she searched for new roles outside the school context as she didn't get the recognition within her school.

> *I prefer to put my energy in things where I can get that recognition and where I am valued. Like the professional association for vocational teachers. And next week I will contribute to a national management conference for vocational education. That is nice to do.*

A large part of the interview focused on the discussions, expectations, support feedback and active involvement from the school leader. Although most participants tried to inform their supervisors on the themes they worked on in essays and research, the number of discussions that resulted from these input was limited. Little initiative came from school leaders and mostly discussions did not get a follow-up.

> *I had asked whether they wanted to read it, but I got a evasive answer all the time: "if it is not too long… Is it useful for me …". These kind of remarks doesn't give you the feeling "Wohh, this is what they have been waiting for!"*

Only one participant indicated that she had several discussions and that her input was used by the school leader.
According to the participants, none of their school leaders had expressed any explicit expectations towards their performance. Six participants indicated that they received no feedback. Only one received explicit feedback.

> *I did get recognition. When I gave a presentation to parents, he said "well done". In personal meetings and performance evaluations he gives me detailed feedback on positive things and on what I can improve. And that is useful for me. He could see my growth, that I could look at the organization with more distance. […] I don't see myself as a leader in the frontlights, but he tells me "You should do that more often".*

Only three school leaders showed their active interest by attending a course sessions where all school leaders were invited and only two school leaders attended the graduation ceremony.
With respect to contact and support from colleagues, involvement often depends on personal relations and on the culture in school. Five participants indicate that they have had frequent discussions with colleagues on elements of their study, on essays they wrote or on the research they did within the school.
Two indicate a lack of opportunities to discuss and share theories and research. Participants on a Master's program can also encounter hostile reactions from colleagues. Two participants give examples of such hostile reactions.

> *I once had the opportunity for 4 – 5 minutes to tell something about my research. And to ask whether they wanted to co-operate. That gave an immediate negative response. They said: "No, I don't want that, you are not allowed to come into my classes". They considered it as very threatening. One colleague said that I had not to interfere with her lessons, The result was that she started a kind of offensive towards me.*

Three participants indicate that they received no support from colleagues. Other were more positive with respect to the support they received from colleagues, in terms of support in editing final texts, willingness to take over lessons, to use questionnaires and collect data in their lessons or in being a sounding boards. One participant mentioned that support was hindered through a lack of formal position.

> *The organizational structure is such that you are either a teacher or you are part of the management. Management is not something that I want to do. If they would organize it in a different way, I could have a different, better role. What I do now, is giving advice on my own initiative, unasked for. And then you often get a response "who are you as a teacher to tell us ..."*

All participant experience renewed expectations from their colleagues, as they expect new theory based contributions and ideas.

> *They expect a kind of educational opinion from me grounded in academic theory and research. When I make a point during a meeting, they accept it. When I say it, they think that it will probably be valid.*

Some participants do not feel confident yet with this role.

> *It is just like your colleagues see you differently. Like you have become some kind of authority. But at the same time it feels uncomfortable that they give you a role, of which I am not always sure that I am able play that role.*

Most participants do not receive feedback from colleagues and indicate that this is a sensitive issue within their schools. Some have received feedback on essays or on their role within the school.

> *During the experiment, we had reflection moments every two weeks. During those sessions I sometimes was corrected by my colleagues: No ..., we had agreed that we would do it together." Then I already had figured out how we should do it, what the plan should be, without consulting and involving them. I had to adjust things in this way, a couple of times. By listening to colleagues. I have learned from that.*

Participant satisfaction of their role and position in schools
Although all participants indicate that they are happy in their jobs, six of them identify elements that they miss within their school, ranging from opportunities to further develop and implement the outcomes of their research, a culture in which they are challenged by their colleagues, a more professional school organization, a stronger position as a teacher in processes of school development, involvement in school based teacher education, to a formal position and acknowledgement through a higher salary scale.
This dissatisfaction can be recognized in the intention to change jobs. Three indicate that they might change jobs where there is an interesting opportunity and four are actively keeping their eyes open for other jobs. Six of them indicate that next to a task as a regular teacher, a new job needs to include a stronger involvement in coaching colleagues, supporting teams or education of new or beginning teachers. Most participants fear that their development stops after ending the Master's course and that they will fall back in old routines. For four participants, the lack of recognition within the school is a strong motivator to look for another position.

DISCUSSION
The findings show that in the design of the course attention was paid to activities and assignments that stimulated the transfer of newly acquired competences to the workplace. However, the contact of the course leaders with supervisors at the workplace was limited and the participants were used as the linking pin. The underlying assumption was that supervisors at the workplace were active partners in the decision for join joining the course. In this first run of the course, the responses from the participants proved this assumption to be wrong.
The initial motivation of the participants was on a personal level, to deepen their understanding of teaching and learning and to be challenged at an intellectual level again. Their motivation for transfer was mainly focused on applying newly acquired competences at the level of their own teaching and their own classes. Only during the course they developed a strong motivation to a wider application of their knowledge towards

their colleagues and towards the school as a whole. This was based on a stronger understanding of organizational issues and a desire to share their knowledge with colleagues.

With respect to the organizational climate, all participants indicate that there was no strategic alignment between the aims of the participants, the aims of the school and the aims of the course. Partly this was caused by the lack of a clear profile of the course and partly by the lack of professional development policy within the school. Situational cues were mostly restricted to the challenges that participants experience in teaching pupils. Only in three cases new cues were introduced through the involvement in new tasks within school that challenged them to use new competences. The participants experienced the formal recognition of their new competences and qualities as very limited. The participants were only given time for study leave. This limited amount of time does not recognize that participants do not only need time to join the course activities, but also need time to try and practice the new competences at the workplace.

Most participants report a lack of recognition, involvement, expectations, support and feedback from their supervisors. Few supervisors were interested in their work, and in most cases participants indicated that they had to fight for attention and recognition. Only three participants got during the course new roles which extended their teaching role and which asked for applying the newly acquired competences.

The participants indicate several cultural factors that limit their opportunities to apply the new competences within their school. The vision and policies with respect to professional development seems weakly developed within six of the seven schools. Within the schools there doesn't seem to be a culture where critical feedback between colleagues is appreciated. As the schools are characterized by a strong culture of equality, influence in school seems to be dominated by formal positions, hindering informal leadership based on personal qualities.

As a result, all participants feel that the qualities that they have developed are not recognized within their school. They indicate that they wish to enrich their daily work with activities that enables them to share their knowledge with colleagues and to contribute to school development. Therefore, more than half of the participants is looking for other job opportunities.

Overall, the participants experience a lack of supportive organizational climate within their schools and they feel not supported in their attempts to transfer their new competences within their school. This lack of support has partly to do with a lack of explicit school policies on professional development, a lack of commitment of supervisors towards the professional development of their teachers and a school culture that does not support informal leadership based on professional excellence. This acknowledges the factors that influence transfer of training that are known from transfer studies in other areas.

This explorative study shows that within its limited design, focusing on the first cohort of a new Master's program, teachers engaged in this Master's program meet considerable obstacles within the organizational culture of the school. If they want to earn recognition outside the formal hierarchy of the school, they need to fight these barriers. If these barriers prove too strong, they might decide to change jobs and apply for a position at another school. On the one hand, this implies a waste of money for their school, while on the other hand it creates opportunities for schools who have a more open climate that recognizes teacher excellence and that can attract these teachers.

CONCLUSION

As indicated above, the design of this study was limited, focusing on the first cohort of a new Master's program. This partly explains the problems that were encountered by the participants. Several participants indicate that the preparation before the start of the course was insufficient. As the Master's program was new, initial alignment between program aims and the strategic agenda of the school could not be made beforehand. This could be remedied in the course of the program as the focus and competences connected to this Master's program become much clearer. We can conclude that the course co-ordinators were too optimistic in their expectations with respect to the commitment of school leaders towards the aims of the course and only limited attention was given to involving school leaders in the design and aims of the Master's program.

Another problematic aspect of the course was that the course did not prepare for an existing teacher profile within the school. Participants indicated that other Master's programs have much clearer profiles: Master's courses that give a qualification for teaching in upper secondary school or master's programs focusing on special educational needs or remedial teaching. School leaders and colleagues have clear and explicit ideas what competences are connected to these Master's programs and what role teachers can have after graduation. The master's program in this research study had a much less explicit profile as it did not prepare teachers for a specific job profile, but focused on 'teacher excellence' without specific relation to the system of job profiles that are used in many schools. This hindered participants to clarify their position and

competences. This is closely connected to the organizational structure and culture in many schools. On the one hand, school organizations in the Netherlands are egalitarian in nature as there is no formal hierarchy between teachers. Hierarchy is connected to formal organizational structures and responsibilities of team leaders and school leaders. This leaves little room for informal leadership for teachers, based on their professional quality and competences.

This study contributed in revealing these obstacles and provides the course co-ordinators with input to strengthen their relations with the supervisors of the participants, contributing to a more supportive organizational climate within the school, and to support the participants in handling the obstacles they meet within their schools. At the same time, the study provides school leaders with insight in obstacles that the organizational structure and culture within their schools create and that hinder the effective use of the competences that teachers acquire in Master's courses. This awareness might help them in supporting their teachers in the transfer of newly acquired competences to the schools, thus contributing to the development of the school as a whole.

263 - Nursing Teacher Formation: Experience-Based Learning

Marlene Fagundes Carvalho Gonçalves[1], Ronildo Alves dos Santos[2], Marta Angélica Iossi Silva[3], and Cinira Magali Fortuna[4]

Ribeirão Preto Nursing School of the University of São Paulo - EERP/USP, Brazil
[1]mgoncalves@eerp.usp.br, [2]ronildo@eerp.usp.br, [3]maiossi@eerp.usp.br, [4]fortuna@eerp.usp.br

Abstract: Ribeirão Preto Nursing School - University of São Paulo, forms nurses and nursing teachers providing undergraduate students with tasks within different contexts in health and education throughout the graduation course. This article analyses those students' experience outside university through the discipline: "Health Promotion in Basic Education", adopting the learning cycle: Immersion in scenarios of professional practice, provisional synthesis, search of theoretical support, new synthesis and assessment. Twenty-one portfolios written by students during this discipline formed the sample investigated. The data were studied following Bardin's theories in the subject of thematic analysis. These portfolios were personal and individual productions, as well as referring to the groups and their experiences. They show students' construction of knowledge and competencies. The importance of such experiences appear during the course, supporting the formation of professionals who are better prepared, critical, responsible and active in the development of programs in health promotion in schools.

Keywords: Professional formation, nursing teachers, experience-based learning, portfolio.

INTRODUCTION

In Brazil, the recent curricular changes in the graduation course of the health area have its sources in two specific moments: the first, with the promulgation of Federal Constitution of 1988. It establishes that "health is a right of all" (art 196), it institutes the Brazilian Unified Health System (SUS), as well as its guidelines: "*decentralization*, with unique direction in each government area; *integral attendance*, with priority to the preventive activities, with no loss to the care services; *community participation*" (art. 198). Moreover, the Federal Constitution assigns to SUS: "to order the formation of human resources in the health area" (art. 200). Since then, it is noted the effort of compromising the university with the construction and consolidation of SUS e with the configuration of new Professional roles, more adequate to the social demands of quality of attention in health, with emphasis in the social integration teaching-service-control (Ceccim, Armani, & Rocha, 2002).

The second moment happens with the promulgation, on December 20 1996, of the National Education Guidelines and Framework Law (Law 9394/1996 – LDB) – when it declares that the school education must be linked to the work world and to the social practice, aiming at the formation at the same time of the worker and the citizen (art. 1º). As an objective for the higher education, LDB highlights: "to form graduates in the different areas of knowledge, able for the insertion in professional sectors and for the participation in the development of the Brazilian society, and to collaborate in its continuous formation" (art. 43). With this purpose, the curricular question gains centrality. It is like this that, in the year of 1997, the Education Ministry calls the higher teaching institutions to present proposals of reformulation of their curriculums for the consolidation of curricular guidelines.

It is in this sense that the main national instance of manifestation of social interests in the health area, which is the National Conference of Health, in its 12th meeting (2004), understands as necessary:

> To modify the model of formation of health professionals, today centred on the disease, reformulating the curriculum of the courses of health professionals, considering theoretical and practical themes related to the promotion, the monitoring and full attention to health, the social control and the multi professional and interdisciplinary character of the health practices (p. 127).

In the specific case of nursing, these concerns with the curricular change, with the new professional profile and the need of a major involvement in the SUS consolidation, resulted in the constitution of discussion forums in the field of National Seminars for Directives of Nursing Education (Senadens), coordinated by the Brazilian Nursing Association (ABEn), since the year of 1994. These discussion resulted with the approval, on November 7 2001, of the National Curricular Directives of the Graduation Course in Nursing (Parecer

CNE/CES 3, 2001), which define the principles, foundations, conditions and procedures of the nurses formation. Therefore the new graduate profile is established: "Nurse, with general, human, critical and reflexive formation." (art. 3º).

From this profile, didactical-pedagogical strategies which enable its implementation are searched – that is, it is searched the overcoming of a traditional pedagogical practice which has shown to be ineffective in provoking a change of behaviours and of practices, demanded by the new modalities of organization of the world of work in health, as well as the challenges of transdisciplinarity in the production of knowledge (Ceccim,& Feuerwerker, 2004; Gazzinelli, 2005; Morin, 2002).

It is in this historical context that Ribeirão Preto Nursing School of the University of São Paulo (EERP/USP) begins, in 2002, discussions for the adequacy of its pedagogical practices to its demands placed by LDB and by the directives of SUS. The new curriculum starts to be implanted in years of 2005, for the course of Bachelor in Nursing (morning/afternoon), and of 2006, for the course of Bachelor and Degree in Nursing (afternoon/evening). Its pedagogical proposal is based in the references of dialogical competence, in the integrated curriculum, in the articulation of the formation to the world of work and problematizing methodology.

It is emphasized that, in the dialogical approach of competence, the construction of meaning presupposes a change of the learning based on the contents for a meaningful learning based on the theoretical-practical integration. It is in the reflection and in the theorization from the professional practice, made in situations of the world of work, that students and professors build and develop their abilities/competences. From this perspective, it is possible to work the contents considering the meanings assigned to them, for the acting in real situations. (Lima, 2005).

Therefore, the EERP/USP, that forms nurses and nurse professors, allows to its student, since the beginning of the graduation course, contact and development of activities in different contexts of heath and education. The student is motivated to learn the knowledge and cause ruptures from reflections, questionings and relationships that he/she establishes in his/her practical experience.

This proposal can be exemplified through the discipline programme Promotion of Health in the Basic Education, taught to students of the second year of the course of Bachelor and Degree in Nursing. The educational practice developed in the discipline is given through pedagogical cycles. Each cycle is composed of five distinct moments, in which learning is constituted:

1) Immersion in reality – moment in which the student, from his/her experiences and knowledge previously acquired, accomplishes activities in the professional practice scenario;

2) Provisional Synthesis – in group, it is accomplished the reading and discussion of the report of each student about the immersion, identifying problems related to the accomplishment of the activities, coming to the formulation of a matter of learning;

3) Search of information/knowledges – individually, survey in varied sources is made, that support the answer to the matter of learning;

4) New Synthesis – in group, reflection about the information/knowledges brought by the students, aiming at understanding the identified problems and reconstructing the professional practice;

5) Evaluation – at the end of each activity, self-evaluation, evaluation of the group and evaluation of the teacher/facilitator are made. (Silva, & Sá-Chaves, 2008).

Each of these moments of the cycle is registered through reports in individual reflexive portfolio. This allows a bigger approximation of the student to the experienced process, while he/she narrates, he/she organizes and reflects about his/her experiences.

As teachers of the course of Bachelor and Degree in Nursing of EERP/USP, responsible for the discipline above, we are directly involved in this process of curricular change, which involves not only its implementation, but, equally, its constant evaluation. One of the strategies for this is the analysis of the students' experiences reported/related in the reflexive portfolios. For containing individual routes, at the same time that they refer to the group, these portfolios bring to light elements so far not observed: the logic, language figures and styles used in each text, which end up pointing the paths of construction of knowledge and competences of the students.

METHOD

It is about a qualitative study, of exploratory-descriptive character. The qualitative researches in education and in the social areas are adequate due to the object nature to be researched: an object that configurates in the social relationships and that are interchangeable. The students are unique subjects, who have a history and critical conscience. Their actions have intention and meaning able to reveal their vision of world and their perceptions.

Therefore, we will search in the qualitative approach, a methodological alternative that will help us understand the reality expressed by these students' opinions.

The qualitative research, according to Minayo (2010), is the one able to incorporate the question of meaning and the intentionality as inherent to the acts, to the relationships and to the social structures. It is supported in the foundation that there is a close and indissoluble between the object and the subject, allowing the emerging not only of the meanings of the question in study, but also the reasons, opinions, beliefs and values of the reality in focus.

In the qualitative research it is searched for a criterion of representativity that allows the generalization of theorical concepts that one wants to test, although worrying less about the generalization and more about the deepening and comprising of the comprehension of the researched group. The qualitative researches have as characteristic the obtaining of descriptive data, collected in the direct contact of the researcher with the studied situation, and it emphasizes more the process than the product, worrying about unveiling the participants' perspective (Ludke, & André, 1986).

The present research is an indenture of the investigation entitled: "The Process of learning in the Degree in Nursing: a study from the students' porfolios". The study followed the recommended ethic norms and it was approved by the ethic committee in research of EERP/USP, with protocol number 0994/2009.

Considering that this research searches to analyze the academics' experiences in the direct contact with the reality, - thus understanding the aspects of the teaching-learning process – and that the portfolios bring, on their said and not said, great contributions for it, it is that this study proposes an analysis of the portfolios for the acquiring of the teaching-learning process in construction and/or transformation, from the lived experienced in the practice scenario.

The portfolio contains registers of the individual course of the learning process and it is also about the other integrants of the group (teachers and students) and still refers to the workers involved in the learning scenario, in this case a State School of Basic Education.

The students' portfolios were analyzed – the names presented here are fictitious – accomplished in the annual discipline: *Promotion of Health in the Basic Education*, taught in the second year of Bachelor and Degree of Ribeirão Preto Nursing School of the University of São Paulo.

The data analysis was made having as reference the thematic analysis technique – a modality of content analysis – proposed by Bardin (2004). Such analysis is situated among different possibilities of categorization, being the *theme* considered a unity of meaning, relevant to study in question.

RESULTS AND DISCUSSION

From the data analysis – portfolios accomplished in the discipline "Promotion of Health in the Basic Education" – it was possible to identify, in the reports referent to the experience in the learning cycles, three greater themes: school approach, appropriation of knowledges referent to the teaching-learning; and the teachers' exercise.

School Approach

The school approach, common space for the students in the students' role, now presents a new possibility. The discipline foresees this meeting with the scenario of the practice in the school of basic education, and this approach becomes something new, almost unknown, generating anxiety and expectatives, like something that mobilizes their experience and history be it personal or academic, like Adélia states, in the report about the activity in class, of discipline presentation.

> *I talked about my experience in teaching biology for the preparation course for university entry exam, and that my greatest expectative is precisely working with a different public, possibly younger. One by one the string was passing and many expectative of the class were mentioned, among them to understand a bit more of the basic education and mainly how the nurse can act in the promotion of health in education. So I realized that these expectatives were mine as well* (Adélia – discipline presentation.)

According to Vigotski (2003) "The personal experience of the student becomes the main basis of the pedagogical work" (p.75). The author already alerted, in work originally published in 1926:

> [...] the passivity of the student, as well as the contempt for his/her personal experience, are, from the scientific point of view, the crassest mistake, such a false rule that the teacher is everything, and the student, nothing. On the contrary, the psychological criteria demands to be recognized that, in the

education process, the personal experience of the student is everything. […] On the basis of the educational process must be the personal activity of the student, and all the art of the educator must be restricted to orient and regulate this activity [...] (Vigotski, 2003, p.75)

Likewise, the dialogical approach of meaningful competence and learning recognize and consider the previous experiences of the student and allow him/her to relate them to the new knowledges in his/her process of construction, rupture and reproduction of knowledges and values which will direct, according to excellent standards socially built, the expected attributes for a determined professional area (Lima, 2005; Araújo, 2007).

The fact that the student arrives with his/her expectatives, added to the previous knowledges about such scenario, seems to prepare them for what they will find, showing them as active in this process. They will be approaching the new scenario as subjects who search for elements for the construction they will make, and not only like passive beings, expecting that something new will be merely absorbed by them. At the same time, they find themselves open to what is new to them, without losing a critical view about what is viewed, like it is observed in Cecília's account, result from the first immersion in the school:

> *During the recognition of the school we realized that there is the need of repairs for the own safety of the children, because some spaces of earth were on a slope and the children played in this space, while the court was closed. These areas could be treated by having small kitchen garden works, and their products could be used in some meals* (Cecília, Immersion 1).

It is also noted in Cecília's statement, the suggestion of possibilities about what was seen. Not only observation or description with someone unaware to the space, but somebody imbued of reflection and pro-activity in the mobilization of resources for the transformation of reality, from what was experienced.

This reflection and mobilization are inserted in the perspective of a teaching process and critical-reflexive learning, from what is possible, in real or simulated situations of the professional practice to guarantee an approximation of the learning to the world of work, what potentiates the construction of knew knowledges.

In the dynamic articulation among work and teaching, practice and theory, teaching and community, students and professors construct knowledges potentially meaningful that qualify better the professional formation (Araújo, 2007).

During this same immersion, all were surprised with the burst of a bomb, which did not let to be one of the subjects in the meeting named Provisional Synthesis, about the experience of immersion, and not in the reports, not only of the immersion but in other stages of the cycle. The following piece relates the occurred in the discussion of the Provisional Synthesis:

> *We started as it was expected talking about the bomb. From this, we discussed about what is normal and what it is not for an adolescent. We talked a lot about the behaviour of the adolescent, which is very specific. And, surely, something which I would like to understand better. There is a certain need among them, like one day there was in me, of breaking rules. Then we talked about the matter of thinking that all of them are slum people and delinquents. I realized that I had seen them like this, elucidating a certain prejudice.* (Adélia – Provisional synthesis, Cycle 1)

The school approach seemed to allow, also, especially by the elaboration of the portfolio, an approach to itself, about the concepts and prejudices brought in, in an experience that was triggered by the situation experienced in the scenario of practice. Cunha (1997) highlights, about the narrative:

> At the same time that the subject organizes his/her ideas about the report – that is written, or oral – he/she rebuilds his/her experience of reflexive form and, however, ends making an auto-analysis which creates him/herself new basis of comprehension of his/her own practice (p. 2).

This is what is observed in Adelia's portfolio: from the student's experience in the school, enriched by the discussion with colleagues and teacher, and favoured by the need of organizing her ideas for the written report, comes an analysis about everything which was experienced, but also about her own view and about herself, resulting in what the student called of "certain prejudice".

According to Ferreira and Bueno (2005) the portfolio is an instrument that improves the reflection about the practice, allowing the construction of knowledge, personal and professional development not only of the teachers but also of the students. They still point that it is about a means which supports the student's growth,

once the objective of the portfolio construction is not centred only in what it is written, but, above reading and elaboration of reflexive and dialogical narratives, from what the student must position him/herself, expanding the search of answers.

For Sá-Chaves (2000), the portfolio highlights at the same time, for the graduate and the educator, self-reflection processes. In it the student can talk about him/herself, contextualize the learnings in his/her history of life, to attribute meanings to his/her experiences and interpret in his/her own way. It is a strategy of formation in which the students build meanings from their own accumulated experience.

From these statements, we can reiterate that in the narratives presented here the reflection, the self-critic and the search for meanings directed and show the potentiality that the elaboration of critical-reflexive portfolio, while a revealing instrument of meanings and senses, which allows the student to build and rebuild, not only his/her knowledge, but also his/her values, contributing for an autonomous and emancipatory formation, from the freedom for the development of reflexive ability, of the expansion of theorical-conceptual basis, of the reformulation of the learning and the continuous evaluation (Silva, & Tanji, 2008).

Appropriation of knowledges concerning the teaching-learning

The experience in the school raises questions that ask for greater foundation, which are being propitiated in the course of pedagogical cycles. They are the learnings about the educational processes which are in focus, as it is observed in the report below:

> *We also discussed the difference between inform and educate, to transmit knowledge and raise awareness. We noted that to educate we will need some methods, which are within the methodology which are three: classical, technicist and progressive* (Adélia - New Synthesis, cycle 1).

We highlight the importance of the discussion about the many ways of teaching and learning and the reflection that this is not a personal choice, neutral of values, principles and directionality because it can answer the proposals of maintenance of the *status quo* and also mobilize for social changes. This can contribute for a integral formation of this future professor and nurse.

> *After the reading of this book (Paulo Freire, Pedagogia da Autonomia) I could note that our nursing school has a curricular structure that is very similar with the autonomy pedagogy, aiming at forming critical-reflexive subjects and this way, as a degree student, when learning this way it is also easier to teach this way, stimulating the subject's autonomy* (Lygia, Lab of Pedagogical Professional Practice, Cycle 5)

In this process, the own experience in the graduation course, in different disciplines and in previous years, allows a significant learning because the student re-visits his/her experience and history. For Lima (2005):

> [...] the meaningful learning requires from the learner a pro-active position which favours the establishment of relationships between the new and already present elements in his/her cognitive structure. This structure represents a set of knowledge schemes constituted of data, concepts, situations, facts, sequence of events, actions and sequence of actions, that can be more or less organized and coherent and that allow the establishment of nets and relationships of different hues of extension and complexity (p. 374).

The search for understanding of the political-pedagogical project (PPP) was made present and we highlight that the approach to this theme from the going to school allowed learnings and reflections, like it is observed in Adélia's account:

> *We then knew the political pedagogical project of the school [...] The project brought as justification to prepare the student for the working market. It presented that the school had low performance in evaluations like SARESP. The objective is to promote education with equity, that is, respecting the individuality [...] The project appeared interesting to me nevertheless idealized. I believe that what is proposed not always come to happen.* (Adélia – Immersion 2)

The student Adélia confronts what she experiences in the school with the directives of the official document that is PPP. And from this experience the group constructed, during the provisional synthesis, a question related to this thematic.

The teacher […] joined us in this New Synthesis, her presence helped us to understand better some aspects of the political-pedagogical project that we did not find. The reports were more focused in the political-pedagogical project, because it was the subject that we tried to deepen ourselves for having had contact in the immersion and it will make part in our professional construction. With the discussion about the political-pedagogical project were put the indispensable aspects in the project, like being a product of democratic collectivity, integration with the community and continuously evaluated. The political-pedagogical project is a search of transforming the recent reality for a better reality. Hence the project does not have an end, it is continuous its process of construction of objectives in the pedagogical work. (Cecília, New Synthesis, Cycle 2)

During the new synthesis we highlight the work of the professor of supporting the students in the systematization of the elements of individual search. For Freire (2007) one of the primary tasks of the professor is "to work with the students the methodic rigor with which they must 'approach' the cognitive abjects" (p. 14). He makes the attentive monitoring through the listening to the experiences, supporting in the confrontation between the most empirical conceptions brought by the group and the theorical elements. It can be noted from Cecília's account that there was an appropriation of the important elements about the political pedagogical project.

It is noted that observed situations in field, end taking to the reflection, to the articulation with discussed themes in other contexts/moments of the course of graduation, allowing the construction of knowledge from critics.

While he presented the lesson he asks the students to MEMORIZE it for the test of the term […] Some students complained that it is not possible to memorize, that it is too much, the teacher says that they have a month to MEMORIZE it. Open parenthesis: Is memorizing a synonym of learning? Learning, knowledge takes place through a process and not of a simple attitude which is the act of memorizing, which passes the false impression of knowledge!
According to Piaget knowledge happens through the imbalance that there is between the subject and the object, in which the subject acts on the object and he/she is attracted, obtaining motivation […].
Mentioning Freire, the students are not bowls to be filled with contents that are put in them, not making any sense to them. From what I observed, the students have no conscience about this fact, it is necessary that they learn to learn, learn to think. It is necessary that the teacher becomes an educator…Close parenthesis. (Rachel, Immersion 4)

We highlight the presence of theorical elements that support the observations of the student indicating an option for a teaching practice that considers the learning as something different from the "memorized" accumulation of theoretical elements. The learning is considered as a reflexive process that needs to make sense and it also requires learning to think and learning to learn.

The exercise of being a teacher

It is part of the proposal of immersion in the school of Basic Education, the development of educational activities that provide the experience of placing yourself as educator. In this situation, new challenges appear about the day-to-day of such tasks, like it is observed in Cecília's account:

The activity I participated, Healthy Eating, was meant to be made at the sports court. […] After we had prepared the posters and the material to be used we called the students informing about the theme and that the classes that will be used as workshops. While we waited for the students in the court, nervousness appeared and disappointment started when the students came close but they quit to enter. But there more people in the workshop we expected, with about fifteen students, when we started the workshop the students accepted well what we proposed, however during the workshop they got easily distracted, we tried another approach but in the end it was very difficult to deal with the students' attitudes without disrespecting them. In the end of this workshop the teachers […] and […] told us that we could use the room of the HTPC, because they had observed our difficult, because the court was an environment of too much freedom. In the second workshop we had between 10 and 13 students, in which the course of it was calmer comparing to the first one, we could explain and discuss better the content we had prepared. In the last workshop I thought we would not have any student, but after we called all the groups we found three students waiting for the workshop to

begin, we started talking to them and to introduce ourselves, then three more students arrived. In this workshop the students seemed to be more involved in the thematic and in this group we could integrate better and we had a more satisfactory feedback. [...] even going through some difficulties I think we could achieve most of our objectives proposed for the activity. (Cecília, immersion 7).

For Vigotski (1984), all learning occurs having as base the concrete social relationships. It can be foreseen thus, the importance of immersion in the scenario of practice for the teacher formation, while the activity, in the context of historical-cultural approach, makes the mediation between the man and the objective reality. According to Libâneo and Freitas (2006), such assumptions

[...] help to understand better the professor's work and his/her professional formation, once the nature and the structure of human activity is approached, the relationship between teaching activity, learning activity and human development. Especially, they make it possible to understand the professional formation from real work, of current practices in the context of work and not from the prescribed work, like it appears in the sight of the technical rationality and like also appears in the common sense conception about formation, which still strongly rules in the schools and in the forming institutions (p. 7).

Therefore, Cecília's experiences allow the comprehension of the activity beyond the prescribed work, challenging her against unforeseen situations or to the initial disappointment for the situation met.
Being in the role of the educator, still in his/her formation process, allows that the new situations can be triggering for the learning he/she accomplish. Zélia's report shows a little about her process:

We realized during the workshop the need of explaining the difference between induced abortion and spontaneous abortion, the girls seemed shocked with the possibility of a possible physiological abortion, one of them said: "if my body wants to expel my baby, I kill my body". I see that making this difference clear was necessary so that there was no false impression that all interrupted pregnancy was caused by the pregnant person's intention, such topic was not recorded in the lesson plan (Zélia, immersion 7).

In this case, the challenging situation to Zélia provoked the reflection about the activity proposed and her own planning, making her think about the possibilities of changes or flexibility of the lesson plan, from concrete experiences in the educational activity.
Vigotski (2003) values and highlights the importance of the student's activity for his/her learning, but not for this reason he despises the fundamental participation of the teacher in this process:

When we grant such an exceptional importance to the student's personal experience are we cancelling the teacher's role? Can we substitute the previous formula "the teacher is all, the student, nothing" for the inverse one: "The student is all, the teacher, nothing?" No way. If, from the scientific point of view, we deny that the teacher has the ability to exert a direct educational influence, that has the mystical ability of "modeling others soul", it is precisely why we recognize that his/her importance is immeasurably greater (Vigotski, 2003, p.76).

The teacher's role that follows the students in formation, as it is the focus of this work, it appears in the sayings already presented: "*The teacher [...] joined us in this New Synthesis, her presence helped us to understand better some aspects of the political-pedagogical project that we did not find.*" or still "*the teachers [...] and [...] told us that we could use the HTPC room, because the had noticed our difficulty.*" Vigotski (2003) points the teacher as the one who creates the condition so that the learning occurs. For the experiences to make sense, the reflection about them is fundamental, and the teacher has an important role in this sense. "The aim of the education is not the adaptation to the environment already existing, that can be done by life itself, but the creation of a human being that sees beyond his/her own environment" (Vigotski, 2003, p.77).
But in addition to thinking about the teachers that follow these students who are in process of teaching formation, it is necessary to highlight that these ones will be future teachers, and their living and experiences, provided by the course, are fundamental in this process. It is learned to be professor by experiences and discussions in this field, and also by the models and relationships that are established with their own professors.

FINAL CONSIDERATIONS

Considering that the main base of the pedagogical work is in the personal experience of the student, which, when shared, creates processes of significance that allow the emergence of knew knowledges, practices, means of acting and participating, the use of pedagogical proposals based in the references of dialogical competence and of the meaningful learning presents itself as a fundamental factor for the achievement of the new professional profile of the nurse: generalist, humanist, reflexive and critical. The analysis of the stories presented here indicates the possibilities of this formative process, form the implementation of strategies as the ones of the pedagogical cycle and the reflexive portfolio. The pedagogical cycle allows a greater articulation of the formation to the work world, while the portfolio improves the reflection about the challenges of putting yourself in the scenario of professional practice. It was from this reflection that emerged the three themes presented here: school approach; appropriation of knowledges concerning the teaching-learning; the exercise of being a teacher.

The stories of the porfolios point the students' reactions against realities little known so far and it indicates the importance of such experiences during the graduation course. The not mere observation or description, but the indicating of possibilities of transforming the experienced, the work with one's own prejudices, are revealing of the reflexive process developed. Moreover, the confrontation of one's own previous experience with the experience of professional practice contributes for the appropriation of knew knowledges about the teaching-learning process. The presence of reflections about this theme in the stories points to the dynamism of this process, explicating some theorical bridges accomplished by the students in the construction of such knowledges. Finally, the demands of the exercise of being a teacher appear with highlights. In this moment of practice, the so called "incidentals", that escape from the idealized situation when planning a lesson, but that make part of the day-to-day of a professor, provide the mobilization of knowledges and ability, through the search of solutions together, colleagues and professors, promoting the construction of competences.

With the experience reported here, we hope to contribute for the formation of a better prepared professional, critical and responsible in the proposition and development of programmes of promotion of health in the basic education schools.

Abstract: This paper presents a research developed in the ambit of a Master in Education, in the area of School Administration and Organization. This research was completed in 2009 and it was carried out in a Portuguese "Agrupamento de Escolas" (a "cluster of schools which includes students from 3 to 15 years of age) aiming at analyzing the political and socio-organizational processes of its creation and development in order to understand the main changes occurred in teachers' work and professional cultures, especially in the ambit of the pre and primary schools which belong to the referred to "cluster of schools".

The theoretical approach focused on the cultural perspectives of organizational analysis, exploring the concepts of school organizational cultures and teacher professional cultures.

The empirical research was supported in a qualitative methodology and developed trough a case study. It was developed both in a synchronic and diachronic perspective, allowing unveil a set of multiple forms of work and teacher cultures that were metamorphosing over more than a decade. Findings show that these processes were traversed by conflicts and negotiations.

Keywords: Teachers' work, organizational and professional cultures; educational reforms

INTRODUCTION

This paper presents some results of an empirical research carried out in a Portuguese "Agrupamento de Escolas" (a cluster of schools which includes students from 3 to 15 years of age), which show deep changes both in organizational structures and in teachers' work and professional cultures. The theoretical component discuss the tendencies of the contemporary educational policies, especially those that led to the creation of the "clusters of schools" as well as the concepts of organizational and professional school cultures, considering the importance of the relationships and the interactions between the members of the organization, not only in which concerns to a single school but to the whole cluster of schools. In methodological terms the research consisted in a case study linked to an interpretive paradigm and carried out through a qualitative perspective.

In Portugal, the "Agrupamentos de Escolas" (clusters of schools) were created under a national legislation, in a generalized and compulsory way, in 1998. Until then pre and primary schools (pupils from 3 to 10 years of age) were separated from the low secondary school (pupils from 10 to 15 years of age). The Decree-Law no. 115-A/98 initiated the generalized process of grouping schools, based on the obligation of each "cluster of schools" prepare a common educational project. As a consequence, a greater influence of the traditional low secondary schools culture occurred, based on a subject/discipline-orientation, as well as a strong tendency towards bureaucratic and standardized processes. These phenomena provoked some turbulence in which concerns several aspects, mainly in the relationships between teachers and their work. For instance, pre and primary teachers' work became more uniform and compartmented, in contrast to their previous cultures and practices which were more flexible and integrated, in curricular and pedagogical terms.

The main changes show the differences of conceptions concerning teachers' work and their professional cultures, either in terms of organizational and pedagogical work or in the administration and management of the "cluster of schools". These changes happened in two phases. The first phase corresponded to the creation of a "horizontal cluster of schools", comprised only of pre and primary schools, which resulted in profound organizational administrative or pedagogical changes, but in a more local-based perspective. Before the formation of this "cluster of schools", pre and primary school teachers worked alone and isolated because schools were small and dispersed, particularly in rural areas like the region where this research was

developed. The creation of the "horizontal cluster of schools" evolves into a situation of a more collaborative work between pre and primary school teachers. The second phase led to the creation of a "vertical cluster of schools", covering schools and teachers from pre-school to the 9th grade, but it was imposed by legal norms and did not correspond to a "desired marriage" between pre and primary school teachers and the low secondary school teachers.

The empirical research was based on ten teachers' semi-structured interviews with two different formats of interview protocols: one specifically aimed at pre and primary school teachers, who accompanied the entire process of forming the "horizontal cluster of schools" and their subsequent transition to "vertical cluster of schools". Another one was oriented towards low secondary school teachers who participated only in the "vertical cluster of schools" formation. The interview protocol addressed to pre and primary school teachers was temporality structured in three parts relating to professional and organizational dynamics: before and during the "horizontal cluster of schools" formation, and later the "vertical cluster of schools" creation. The interview protocol for low secondary school teachers was organized only in two phases: the organizational and professional dynamics before the formation of the "vertical cluster of schools" and the period when it was formed.

In order to protect the respondents' anonymity, fictitious names were invented under the inspiration of the local fauna: These names were used on the vignettes that reproduced the extracts drawn from the interviews. Thus, Butterfly, Dragonfly and Ephemeral were used to identify the three pre-school teachers; Ladybug, Damselfly and Kingfisher were the names used for primary teachers (the last one was the school principal); Barbo, Jay, Hydra and Hoopoe were the names used for the low secondary school teachers who participate in the "vertical cluster of schools" formation.

Findings reveal the specific local context idiosyncrasies and show changes in teachers' work and more deeply in their professional cultures and in the school organizational culture based on the new reality of the "cluster of schools" organization. It should be noted, however, that the process of the construction of vertical cluster school has been also providing relationships and learning situations between teachers of different levels: pre, primary and low secondary school.

These research findings have encouraged the continuation of the research, now through a doctorate dissertation, in order to develop a deeper understanding of the changes in teachers´ work and professional cultures taking into consideration the period of the three decades of successive educational reforms.

THE ORIGIN AND EVOLUTION OF THE "CLUSTER OF SCHOOLS" ORGANIZATION

As a way of promoting the schools' autonomy policies and implementing better coordination and continuity in the nine years of the compulsory education (organized in three cycles) envisaged in the Portuguese Education Act, the creation "cluster of schools" was legally imposed constituting a new organizational matrix. However, previous initiatives had already formed part of these political and organizational perspectives.

To address specific and contextualized problems in certain geographical areas, different political programmes and initiatives had already been developed trough diverse forms of schools' association, some of them with a local-based orientation and other on a centralized way, based on national wide measures.

In a case study conducted by Flores (2005) about the creation of a "vertical cluster of schools", the author asks to what extent the compulsory way of creating the "vertical cluster of schools", considered as "management units", doesn't contradicts the Decree Law no. 115 -A/98, May 4 recommendations, which allows the creation of "cluster of schools" both in an "horizontal" and "vertical" way, it means, clusters of schools attending students from 3 to 10 years of age and cluster of schools attending students from 3 to 15 years of age. According to this author, the political priorities demonstrate an orientation to centralization and uniformity rather than effective school autonomy and diversity. As Flores states, "Although the rhetoric autonomy in the clusters' formation process, it stands the more centralist government logic, seeking to regulate the socio-educational school practice, which is overlaid with features to enhance their influence and authority over the schools" (Flores, 2004, p. 125).

Concerning this type of contradictions between a centralized process of control and the discourse of "school autonomy", the Order no. 13313/2003, June 8 sets out the planning of the education network in 2003-2004, stating in its preamble, which is fundamental to the achievement of the "cluster of schools" process, "a process that is envisaged, follows from Decree-Law no. 115-A/98, May 4, certain key objectives, such as favoring a sequential students' course [...] the rational utilization of resources, ensure the implementation of autonomy, administration and management scheme."

Simões (2005) argues that the "cluster of schools" constitution reveals an "aggressive re-centralization" plan with compulsory and authoritarian indications to form "vertical clusters", against the procedures and wishes of local actors connected implicitly with the structurally different clusters formation.

In brief, apparently, educational policies are moving forward on decentralization and autonomy, however, the educational system has remained quite centralized and bureaucratic. As Afonso (1994) states, "continuing the long country tradition, the key issues as the curricula design, course content, human resources, equipment and budget management remain in the central government hands" (p. 118). This centralized and bureaucratic education governance continues with a strong mark in the "cluster of schools" organizational processes, including school and professional cultures.

THE SCHOOL ORGANIZATIONAL CULTURE AS A SOCIAL CONSTRUCTION BASED ON INTERACTIONS BETWEEN ITS MEMBERS

Organizational culture is a multidimensional and multi focused concept. As regards Duarte Gomes (2000), addressing the culture as a univocal concept would present as like misleading formulation because "they are multiple and controversial concepts of culture" (Smircich, quoted by Gomes, 2000, p. 65). Sharing the view that "the organization shall be understood as a social construct, that is symbolically constituted and interactively reproduced, whose maintenance is dependent on the activity of the organizational actors' communication" (Gomes, 2000, p.165), the concept of organizational culture takes up a heuristic function for presenting the complex reality of the interpersonal relationships of the organization members, including the formal and informal structure.

In the ambit of the companies and business areas, the concept or organizational culture have been uses in an instrumental way, focusing the relations between the members of the organization for being a benchmark for belonging and identification with the values commonly accepted by the group within the organization. However, transposing uncritically this perspectives to the specific school context, adding a modeled image, is not adequate because "not only the organizations are different, not only the school is different from other organizations, but every school is different from any other school" (Costa, 2003, p. 109). The school as an organization has its own peculiarities in its political, ideological, social, cultural and organizational action. Although the "normative and cultural walling", by the national centralized legislation, the schools present themselves as straight-organizations assuming approaches with a "multiple facets"(Lima, 2006, p. 7), revealing a great complexity, which "allow us to identify distinct logical directions, goals and rationalities" (Torres, 1997, p. 55).

This multifaceted view of the school as an organization has become more appropriate for the development of the empirical study which are presented in this paper, given the singular "cluster of schools" context, both in its physical, distinct and diverse location as the fact that they provide for different levels and stages of education, with teachers who have diverse professional identities and cultures. Thus, the concept of organizational culture in the school context can be understood through several different perspectives and approaches. In this research, a conception based on the idea of organization culture as a social construction based on the interactions between members of the organization was adopted, because neither the culture of the school organization results of the social structure, nor the organizational structure, but the actions, interactions and negotiations between various actors in a school organizational context. Therefore, it seems pertinent to note that in terms of epistemological orientation, the privilege does not focus on an analysis of the culture of the school organization but on an analysis of culture in school organizations, where the groups comprising the school organization begin to play an essential role. Summing up, the school organizational culture is conceived as a social and cultural construction of the actors that "live" in its degree of consensus and the actors' intention to change, both internal and externally. Actions, relationships, interactions, conceptions and practices are fundamental for the construction and reconstruction of organizational cultures. Following this train of thought "the genesis and construction of a school organizational culture seem to be, once again, confined within the school physical boundaries developed by interactions and negotiations between actors, who are now analyzed as the protagonists of the cultural creation and recreation." (Torres, 1997, p. 83)

TEACHERS' PROFESSIONAL CULTURES

The "clusters of schools" comprise different levels and stages of education, just different professional groups: pre, primary and low secondary school teachers. These groups belong to very different realities, with singular cultures and identities, not only derived from structural factors that contributed to their separation, but also due to the other factors connected with different worlds of socialization and identity (Ferreira, 1994, 2003). Similarities between pre and primary school teachers' are a consequence of their own cultures,

influenced by the physical conditions, such as the smaller school buildings and fewer number of students; the kind of pre and in-service teacher training; the more integrated or compartmented curricular and pedagogical organization, and also as a result of historical factors which have originated structural and cultural differences between teachers of different school levels. In other terms, differences concerning organizational and professional cultures are linked to: different views about the profession; belonging senses to schools; individual and collective autonomy conceptions; diverse strategies for the recognition of teachers; different orientations towards students' learning, in a more global or more subject-compartmented way, among other factors. It means that teachers do not have a professional identity but diverse professional identities connected to different diachronic and synchronic aspects.

According to Ferreira (1994), teachers of different school levels have several representations of their profession, not necessarily in the sense of a "divided identity", but rather as a "multiplied identity." As Ferreira contends (2003), "the teaching profession can't be seen in a unifying and homogenizing` perspective" (p. 44), whereas there isn`t a professional identity in a general sense, but in the plural sense, i.e., teachers identify themselves primarily with their peers in the same level of education and even more narrowly within their own discipline/subject group. This form of identity is very visible at the post-primary education level, where teachers identify themselves more with the discipline/subject they teach, which is reflected in mechanisms of a mono-disciplinary socialization. The level of school teaching, the discipline/subject they teach, the academic and professional qualifications, the situation of stability or mobility, among others, are several factors that, according Ferreira, contend and compete for that heterogeneity of identity. The concepts of cultures and subcultures have been associated and "often used to account for exactly this diversity and heterogeneity that characterizes the teaching profession" (Ferreira, 2003, p. 44), providing an open and plural approach to the investigation of diversity and different "ways of being professional" (Gomes, 1993, p. 98). Therefore perspective brings into the confrontation, one vision of "unifying professional identity" and a vision "inextricably fragmented"(Ferreira, 2003, p. 46).

On the base of Claude Dubar, Ferreira (1994) argues that the professional identity is a biographical and contextual construction, which is born, grows and matures from the moments that starts and "cultivates" the working relationships between pairs, in their actors' games, with the participation in collective activities and projects developed at the workplace. The greater or lesser degree of the deepening of the above mentioned processes, at different levels and stages of education, prospects for a non-homogeneity image in the social group constituted by the teachers. Remember the "absolutist and centralist" historical way that pre and primary school organization had a trend of teachers' conformity and passivity (Formosinho, 1997), which are related to the Portuguese dictatorship; the traditional centralized and bureaucratic educational system; the small schools with a great percentage with only a teacher which led to the teachers' isolation and hence the tendency towards an individualistic culture.

With the creation of the "cluster of schools", significant changes in teachers' professional cultures were operated. For a better understanding of these traditions and changes, in the next section the typology of professional cultures produced by Andy Hargreaves (1998) will be presented. According to this author, "the culture passed down to his inexperienced new members the solutions historically generated and collectively shared of one community" (p. 185).

Teachers' professional cultures, according the Andy Hargreaves typology

Andy Hargreaves (1998) identifies four broad types of teachers' professional cultures: individualism, collaboration, collegiality and artificial balkanization.

For this author, individualism, isolation and "exclusive" are the peculiar components of teaching culture. Although a variety of aspects can influence teachers' work and culture, individualism continues prevailing. The author reported that the classroom isolation promotes privacy and protection from outside interference, thus, individualism is associated with the defensive of behaviors, mistrust and the possible and "natural" teachers' flaws and failures, as a result of teacher' "uncertainty of work". The individualism as a workplace condition is not perceived as a "personal weakness", but as a result of an "economy of effort and a rational organization of priorities carried out on a desktop hard pressed and embarrassing" (Hargreaves, 1998, p. 191), as a result of the adaptation of a strategy to the desktop.

In brief, in this perspective, not all individualism is "perverse" and constitutes limited professional behavior, because the individuality can support and enhance a creative talent, that otherwise has not got any possibility to manifest itself.

Collaboration and collegiality have been targeted at the rhetoric educational level, as new fundamental paradigms to promote the change of schools, a teachers' professional growth and schools' development from internal initiatives. According to Hargreaves (1998), collaboration and collegiality promote improvement "in

addition to personal reflection and idiosyncratic, or dependence on outside experts, so that teachers learn from each other" (p. 209). They contribute also to the better development and implementation of educational changes externally initiated and introduced. In addition, collaboration and collegiality develop power relationships which, according to Blaise (quoted in Hargreaves, 1998, pp. 213-214), may fall within the micro politics perspectives. This perspective focuses on issues related to power and control and "the use of power to achieve preferred outcomes" emphasizes more the issues with the "differences between groups within an organization than with their similarities" (Hargreaves, 1998, p. 214).

Reflecting on these developments, Fullan and Hargreaves (2000) argue that collaboration at schools presents a fairly limited. The planning of teaching units and lesson preparation can be held together, but after then, there is not, among peers, a mutual involvement in the work accomplished observation in the classroom.

In the "artificial collegiality", as argued by Hargreaves (1998), "collaborative professional relationships between teachers aren't spontaneous, voluntary, to development oriented, and extended in time and space unpredictable" (p. 219); arise, instead, from the administrative rules. According this train of thought the degree of predictability has sometimes perverse and not guaranteed outcomes. The artificial collegiality is a secure administrative simulation to boast the cooperation of teachers. This type of collaboration is "compulsory, not voluntary, limited and fixed in time and space; oriented to the implementation, rather than for development, and designed to be predictable - rather than the unpredictable - in their results" (Hargreaves, 1998, p. 234), i.e., everything is administratively controlled and imposed. Teacher's creativity and initiative are disregarded and, at the contingency moments, the situations that unexpectedly arise tend to be ignored. These authors believe that the main results of artificial collegiality are the "inflexibility" and "inefficiency": teachers are obliged to meet, there is no reason to do so, they do not meet when they need and the partnership work not always joins the colleagues adequately.

Finally, regarding the "balkanization" as a type of teachers' work and culture, the work and organizational relationships established between teachers, namely, cooperation and collegiality, shape cultural typologies of the teacher' profession, both can unite or divide the teachers, within the educational establishment, in isolated groups or subgroups, presenting sometimes adversaries of each other (Hargreaves, 1998). He called this specific type of teachers' work interaction as a *balkanized culture*. Hargreaves notes the following factors to describe this type: teachers do either not work alone, nor with most of their school colleagues, they share smaller subgroups (the subject departments, the pre or primary departments, special education), they behave sometimes as adversaries. In the same sense, Lima (2002: 29) refers that "departments intensified the competition among teachers in schools, leading to loss of an interdisciplinary perspective". Siskin (quoted by Lima, 2002, p. 31) states that "the school's social world has expanded so much that finally ended up, or splintered, to the point of the department, more than the school, which effectively marks the most teachers' main interactions ties." The department "creates borders within the schools and present barriers to possible interaction patterns at the educational establishment level" (Lima, 2002, p. 31).

Although the Andy Hargreaves typology has been performed in the secondary school context, it seems pertinent to use it in the "cluster of school" context. The underlying policies which support this new organizational and administrative unit (a cluster of schools), which comprise different school buildings belonging to a specific geographical area, intends to improve the continuity between different school levels and link the teachers articulation, concerning their organizational and curricular work, based on the assumption that the development of joint planning work fosters a more collaborative actions and collegiality among teachers, questioning the isolation and individualism. Thus, some issues arose, such as exploratory research hypotheses.

- Has the "cluster of Schools" formation involved the local dynamics of teacher's work?
- Have the interactions between teachers of different educational levels promoted the isolation and decrease the individualism?
- Have collaboration and collegiality begun with the "clusters of schools" formation developed spontaneously and voluntarily or were administratively imposed?

Answering to these main questions was the objective of the empirical research carried out in the ambit of a master dissertation which is currently in progress in the ambit of a doctorate at the University of Minho.

THE DYNAMICS OF THE CREATION OF THE "HORIZONTAL CLUSTER OF SCHOOLS": A LOCAL INITIATIVE

This section analyzes the origins of the process, which consisted on the creation of a "horizontal" cluster of schools. The presentation of data includes the quotations of the interviewees.

For a long time a school principal "dreamed" of a new organization for the pre and primary schools of his county. "There arose the possibility, of their own volition and own nomination, constitute the cluster", refers Kingfisher (the fictional name given to the school principal, as above mentioned). He states as well that "it also exists on the Regional Administration, including the Director, some willingness to experiment, to get this experience." As reported Kingfisher, "the teachers were then consulted. We had a general meeting, where pre and primary teachers were stakeholders." Kingfisher recalled with smile, what happened on that day.

> "At this meeting I am reminded of a phrase that a teacher stood up (pause), there has been a stalemate there ... When you go for something new there's always some reluctance, not completely at ease, it seems to me that it's human. I remember one teacher stood up and said – to worse it will not go, certainly, so let's try it." (Interview, Kingfisher)

The first stone was laid for the "cluster of schools" formation, encompassing the pre and primary schools. It has long been known, that lived almost back to back, but with the possibility of understanding, a gentle nudge was enough to "trigger the process."

> "We launched this challenge to ourselves. We made the writing proposal to the Regional Director. He approved. It triggered the process: the selection of the Executive Group to launch after the whole organization. "(Interview, Kingfisher)

Then also some other occurred questions, as reported by the Ladybug teacher: "I was one of those who came with a bit expecting and put some doubt if it would work, because possibly it could be a project with a political feature, of local policy ...." This doubt was related to the Mayor's interest and presence meetings. Ladybug's fears were linked to the fact that the Cluster "was not in the real school, students and community interests." Such fears have dissipated later with the teachers' work developed in the terrain.

> "After, this show us who we're completely wrong, because greater responsibilities have been given to us. Monthly meetings, on the teachers' councils, we specifically talk about pedagogical issues. At the time we didn't make much lesson plans, but carried out projects, we analyzed documents, at the time we were outside, entirely out from the legislative part, because this paper was made by the Delegation School. Now we're building our project and we have been given new responsibilities."(Interview, Ladybug)

The "horizontal cluster of school" formation was not a simple task, despite the motivation, however, revealed. There was no legislative backing to provide the organizational structures array for the pre and primary "cluster of schools". It was a bit difficult because it was something new, similar cases not abound in the country where they could seek suggestions. But among teachers, there was awareness that was necessary change, work and organizes themselves in different way.

> "We ended up going into the wave, because it was something new and we also had some curiosity in change, because all that innovation is also interested in [...] everyone was aware we needed to change ... in our view it would be for the better. (Interview, Dragonfly)

Kingfisher notes that they departed "even from scratch. But it was a funny experience because deep down we had a better effort, but I think it paid off. Roll up our sleeves and started working differently. "Despite initial uncertainties, the teachers were involved in "cluster of school" organizing, created new structures. They were hopeful in finding other work forms that would lead to a better situation. They created the Poles / Councils of Teachers, the teaching group, by nature, where the joint work between the pre and primary schools were started to develop.

> "In the beginning [...] it began to print a dynamic work [...] already thinking in the teaching and how much work had to do [...] the meetings of the School Council [...] were Poles now." (Interview, Ladybug)

This change from the old structure - the School Council - for the new set up structure - Polo / Council of Teachers - wasn't easy to achieve. It was recommended a geographical restructuring, embracing schools of

two or more parishes. Likewise, shaped in the same Pole / Council of Teachers the pre and primary schools of the same parish, whether they worked in the building attached or separately.

> *"We thought it was a funny experience, the pedagogical link, essentially pedagogical, between pre-school and primary. There're two different realities, back to back, and so there was a culture of some isolation from, each do for him. So we have proposed ..., and were accepted. "(Interview, Kingfisher)*
> *"It began to exist some experience exchange, [...] more extensive between the two levels. They're programmed some joint activities at the teachers' council, instead of being in separate form. It began to be a greater sharing and interaction among teachers. "(Interview, Dragonfly)*

The Teachers Councils have been trained according to the geographical identification zone, consisting of the pre-school and primary. Gathered together and monthly.

> *"At first, it was funny. Some colleagues at the preschool said: "this is difficult because at primary school talk too much of legislation...." At the time we commented "well that's great. They are two completely different realities. We must find some balance here because the two things are necessary" and began to work better and successfully. We could end up with the barrier between the preschool and primary school. "(Interview, Kingfisher)*

The creation of this educational structure has emerged to greater coordination, collaboration and participation in the pedagogical activity. For teachers was important the "horizontal cluster of schools" constitution, especially in the pedagogical work organization, in the whole cluster.

> *"There was a greater sharing of professional knowledge and greater disclosure of what each level of education did. Some establishments more isolates have to be more in touch with others. The new ideas and projects were valued that were presented and developed. They made up more joint projects, involving more primary schools and kindergartens. (Interview, Butterfly)*

If before the "horizontal cluster of schools" formation the work way in preschool, resulting from the achievement of an annual work project created and participated by the all county kindergarten teachers, not 'contagious' the primary school teachers. The "horizontal cluster of schools" formation changed the teachers' behaviors. The kindergarten teachers "influenced and motivated" the primary school teachers to change their practices and to develop council projects with the participation of all schools.

> *"Ephemeral said that the primary teachers have enough gained with the formation of Teachers Councils because they went to witness the way they prepared the preschool activities and what was taught there. Then, they also began to develop their teaching supported in the work project. It began to see a greater coordination and sharing between them. "(Note from the field, 21 November 2007)*
> *"The Teachers Councils staged a union of teachers and educators. There were changes from the moment they have got Poles. But, it was not easy in the beginning because we did not have the same interests and work with children was different. We adapted a lot of things and we adjusted the work form to create a certain joint. "(Interview, Dragonfly)*

This view is shared by Butterfly:

> *"The changes that occurred more frequently were linked with a substantially improved interaction and coordination between the two levels of education. The educational part was fairly valued because the teachers could share their experiences, their beliefs and anxieties. There was a greater sharing of professional knowledge and greater disclosure of what each level of education made. "(Interview, Butterfly)*

In the first two years of the horizontal cluster, the executive director empowered to appoint the representatives of the main organs of senior and middle management that would create from scratch, such as: the Executive Council, the School Assembly, the Pedagogical Council and the various Poles / Teachers Councils.

"We had lots of training abroad, [...] we worked a lot with decrees and laws, [...] now we have a broader vision, [...] later became necessary to form the School Assembly, I were responsible [...] I contacted some colleagues, who I knew and I saw that they were dynamic people and could contribute better, [...] on one side was an invitation, but willing of all to participate."(Interview, Ladybug)

The Teachers Councils emerged from the need for joint and collaborative work between the kindergarten and primary teachers. Kingfisher opted to create a structure where teachers and educators were included, and this was quite innovative. He recalls that, at first meetings, the minutes reflect the teachers' attitude of passivity, postulated by the proposals absence made by them, which indicated also a no participation culture; they were accustomed to mere compliance with the guidelines set by superiors. Gradually they have developed greater involvement culture in the organizational structures of the cluster, which contributed to give visibility to some autonomy built.

This section ends with Ladybug teacher statement, reflecting the teachers' professional evolution and "growth".

"Many teachers seemed passive people (...) they proved to be great professionals, in terms of dynamics and the suggestions that appeared, projects which we started to develop together (...). Later, the people recognized that teachers were more open with each other, we had not so many fears, we exchanged many ideas and work dynamics. "(Interview, Ladybug)

In brief, the "horizontal cluster schools" formation supported a great transformation of the organizational and professional culture. With the creation of the new structure emerged a greater coordination, collaboration and participation in educational activities of the "cluster of schools" management by educators and primary school teachers. While in the initial training of Poles / Teachers Councils could encourage a collegial artificial, driven by the Executive Director, the teachers quickly found favor in working collaboratively, following the methodology previously developed by the educators.

THE "VERTICAL CLUSTER OF SCHOOLS" FORMATION: AN UNDESIRABLE MARRIAGE
The formation of the "Vertical Cluster of Schools" resulted by a national normative regulation, i.e., it has not made from any desired local stakeholders.

"The Regional Direction (DR) imposed compulsorily the formation of the "vertical cluster of schools". At this time we did not understand the goal purpose of its creation, because was not very logical itself. People in both sides did not identify very much with it. However, as it was mandatory, it had to be built. "(Interview, Kingfisher)

The passage to the "vertical cluster of schools" took on a forced marriage character, for convenience of Education Ministry (ME), without the main stakeholders' agreement.

"It was wrought by DR, with guidance issued by the ME, in a time that nationwide intended to create clusters of schools. As our county is small [...] the decision did not become from the bases, but top down, enjoying the ME toward DR created "vertical cluster of schools" immediate." (Interview, Jay)

Indeed, organizational change, with the passage to the Vertical Cluster, did not reveal either a substantive change nor modified the *modus operandi* of the two progenitor organizations. The separation between the teachers was obvious.

"Have you checked *how the teachers organized themselves in Pedagogical Council? You enter and see on the left side the pre and primary schools representatives, on the right side the low secondary school teachers and to separate both the President of the Pedagogical Council. "(Field Notes, November 21, 2007)*
"Apart from aspects of collaboration informal gathering is almost nonexistent."(Interview, Barbo)
"The collaboration was rarely before, very rarely, but there are not many now." (Interview, Hydra)

Given this reality, and in order to dilute this "unwanted marriage" there were aimed some actions that stimulated a broader integration of all teachers.

> *"I think this school is privileged over other in this respect. I hear comment from my colleagues of other schools where I also worked. It is not easy to find a school where people give as well as this ... It notes by the participation in lunches and dinners, especially the pre and primary school teachers. They are a very assiduous presence. "(Interview, Hoopoe)*

Informal means of integration, including lunches and other recreation, formation of joint working teams, seemed to please the teachers and facilitated among all a better interaction and integration.

CONCLUSION

Before the formation of the "horizontal cluster of schools", the pre and primary school teachers were separated by an 'imaginary boundary' supported in the educational level difference. There was an isolation culture, "keeping to himself" the good teaching practices, sharing no experiences. The work was only carried out within the closed-classroom, without the educational community involvement.

With the construction of the "cluster of schools", in order to increase a participative and collaborative culture, sharing, joint work and promotion of the Teachers' Councils activities, Kingfisher made a point of be present at meetings where aid and abet this culture, among teachers. If the Teachers' Councils adding educators and primary school teachers, promoted greater joint planning and greater pedagogical link, the existence of several and different Teachers' Councils, also consubstantiates a balkanized culture, contributing to micro political development, small conflict manifestation and "struggles" for better conditions of participation and financial support to submitted projects. The collaborative work in the Teachers' Councils, because administratively imposed, by the need of joint planning and pedagogical link, can configure also an artificial collegiality, co-opted with guidelines and superiors hierarchical.

With the "vertical cluster of schools" formation, the Curriculum Departments / Teachers' Councils continued working separately with the same organization which they had already before.

In summary, the imposed creation of the "vertical cluster of schools", despite the attempts of successive Vertical Group executive bodies, to encourage greater interaction and network among the different levels of education teachers, they did not yet see themselves, in this organizational form. There is, in practice, a balkanized culture, with each education cycle working alone, disjointed, did not quite knowing what projects are developed by each one. In general, teachers' contacts and relationships come informally, occurring during the gatherings that are implemented usually throughout the year.

Some questions left open in this research concern to the pre and primary students and teachers' concentration in "Schools' Centers", i. e., new larger school building were recently created for pre and primary levels and the more rural and small schools were closed. Therefore, new research questions emerged, such as: does the teaching in the same school bulging and environment, educators and primary school teachers, foster greater interaction and collaborative work, opening their traditional closed classrooms? Does the teachers' work balkanization, in which concerns to the different teachers' school levels, will dilute and lead to a more coordinated and collaborative work and culture? Will these new organizational changes promote sequential work between the three cycles of "basic education" (until the 9th grade)? What kind of collaborative work will be developed in the new circumstances, if the administrative organization maintains a departmental-based perspective instead of a more flexible curricular and pedagogical organization in order to overcome the centralized and bureaucratic organizational and professional cultures?

270 - The (in)Visible Body in the Nation-Wide Syllabi Parameters – Elementary School

Cristiane Pessôa da Cunha Lacaz

1 Instituto Tecnológico de Aeronáutica [Aeronautical Technological Institute] – ITA, Brazil – Students' Division
clacaz@ita.br

Abstract: This thesis stems from reflections on the manner in which the body is represented in the Nation-wide Syllabi Parameters [Parâmetros Curriculares Nacionais] – PCN's, for Elementary School, in light, for the most part, of Foucaultian references. As a health and education professional, I sought to develop this survey as a result of my musings about how I think about the body as a concept and the ways in which I would like to see it represented in school. PCN reviews showed noticeable differences between the guidelines on the body, in the subjects that were objects of research. The truths about the body have been pieced together by way of a discourse produced on the borderline between several pedagogic avenues. They exert the effects of power and knowledge on each one of us: students, teachers, parents, other family members and professionals of several areas. Being able to become familiar, in greater depth, with Foucault's writings on the body, power, knowledge, discipline and self, has triggered, in me, other possibilities, of resistance, struggles, reflections, with regard to what lies before us. It has also enabled me to devise other ways of thinking and working through education of and in the body.

Keywords: Body; Nation-wide Syllabi Parameters; Elementary School

INTRODUCTION

In the mid-1990's I had the opportunity of going through a number of professional experiences that caught my attention and piqued my sensitivity. Back then, the work was being conducted, for the most part, within institutions and service entities whose purpose was to serve Rio de Janeiro city – RJ - public-school children and teenagers. As a nurse and a teacher, my job title was coordinator of the "The Child, The School and Myself"course – offered in the first semester of the undergraduate program at the Ana Nery Nursing School [Escola de Enfermagem Anna Nery] of the Rio de Janeiro Federal University [Universidade Federal do Rio de Janeiro] /UFRJ – whose practical content was based on the students' health condition diagnosis, proposing solutions and, performing research on situations found within the internship scenario.

This was what triggered, back then, my approach to public education at the elementary and secondary school level. By the same token, the reflections on those activities were, in fact, the seeds of my ideas for doctoral research work.

Based on a few assumptions, I outlined, as the **scope of my study:** "Contents on the human body proposed in the Nation-wide Syllabi Parameters – PCN's – for Elementary School".

The Nation-wide Syllabi Parameters were written in the mid-1990's by a group of Brazilian researchers/educators in order to provide more breadth and depth to the education-related discussions and to kick start a change for the better within the Brazilian educational system (BRASIL, 1997).

This study's track record was organized in two instances: explicitation of subjects which are part and parcel of the Nation-wide Syllabi Parameters; Elementary School, which contemplate body-related contents, a review of the contents listed in step (1), in light of the concepts studied by Foucault: body, power, knowledge, discipline and self.

- **Natural Science in the PCN's – The absent body**:

The workbook associated with Natural Science recommends that the body not be compared to a machine. Nevertheless it uses comparisons between man and other living beings, as will be ascertained in several excerpts of the PCN's.

An analogy between the human **body** and a machine is commonplace. It is common but inappropriate. As is the case with all living systems, the **body** can reproduce, perform exchanges with the

environment and self-regulate. These features, for the most part, set it apart from a machine (Brasil, 1997, p. 62).

Nevertheless I notice that under certain circumstances in day-to-day life at school, some body parts are explained by using some machinery and gears, and this does not adversely affect the understanding and the specificity one wishes to convey, for instance about the organ ("the heart works like a pump which makes the blood flow"; "the venous system is like a complex plumbing network"; the brain is a complex central computer).

The document indicates contents on the transformations that take place during growth and development, focussing on the main features — relevant to the body, behavior and attitudes — throughout the various phases of life: "Special attention is given to the study of the essential requirements to ensure the child's health, measurements for the prevention of contagious infectious diseases, especially **AIDS.** These issues are also dealt with in documents on Sexual and Health Counseling" (Brasil, 1997, p. 50).

In the record above, AIDS is highlighted. Thus I notice, in addition to the strong impact that the outbreak had in the 1990's, that is, when the PCN's were prepared, the control and the focus on the sexual themes, and the connection, in many instances, between the "sexuality" theme with the possibility of becoming ill.

> AIDS has carved itself a special place in the body's history throughout the XX Century, even though it only left its mark in the last two decades of the century. Just like syphilis, which is associated to the New World exploration, and cholera, associated to the acceleration of transportation and colonial expansion, it brutally denied the century the bragging rights for eliminating infectious diseases (Corbin, Courtine, & Vigarello, 2008, p. 33).

The PCN's – Science, on several occasions, propose the study of the human body based on comparison with the bodies of other animals, both from a physical and from a behavioral standpoint.

> In addition to establishing **comparisons** between various human beings, it is interesting to **compare them** to a number of animals. The general structure, the **body's** surface, the upright stance, limit and reach of the means of environmental perception (issues inherent to the sense organs) may be exploited (Brasil, 1997, p. 51).

I see such comparison with reservations, since I believe the study of man's body should be more specific and seen under certain perspectives that are not comparable in other living beings (cultural, ethic, social, economic, historic, among others).

In this cycle, teachers are also confronted with the need for studies on male and female reproductive systems, throughout puberty[74]:

> In this cycle, the studies about male and female reproductive systems and the changes that boys' and girls' **bodies** he go through during puberty. The observation of one's own **body** (what it is like, what it was like, what changes are going on now) and the comparison of these data with the development Standards – which may be obtained from **health workers** [...] (Brasil, 1997, p. 65 - 66).

In more than one opportunity, the PCN's suggest that the school seek further health-related information in other environments and with other professionals, the health workers[75]. Such a proposal, in addition to undermining the teacher's position, bestows on the health worker, whose professional qualifications are quite modest, great responsibility, and, to make matters worse, is based on the assumption that the health center

---

[74] The study indicates the poor training of Science teachers in sexual education lectures. This was ascertained by educator Cláudia Ramos de Souza BONFIM, who presented her doctoral theses on this issue at School of Eduction [Faculdade de Educação] (FE) of Campinas State University [Unicamp] (Thesis: Sexual Education and Biology Teachers' Training: contradictions, limits and possibilities) [*A Educação sexual e a Formação de Professores de Ciências Biológicas: contradições, limites e possibilidades*]), advisor: Prof: Sílvio GAMBOA. Fonte: Jornal da UNICAMP, Campinas, 25 a 31 de maio de 2009, p. 04.

[75] Law # 10.507, sanctioned in July 2002, regulates the profession of Community Health Worker. The requirements are: one has to live in the area of the community one will serve and one must have completed elementary school.

has the availability to play host to groups of children and teenagers, when, in fact, it is overburdened with work and has to deal with a number of difficulties.

- **Art in the PCN's – The sublime body:**

With the preparation of the PCN's, the task of teaching Art was broken down into four modes for elementary and secondary school: visual arts, dance, music and drama. The school has to choose which of these modes will be a part of its syllabus, and on which moment of these phases of the school experience they will be present.

Dance is highlighted in the PCN's for the 1st through 4th grades, as part of several cultures and integrated in work, religion and leisure. Likewise, dance is part of a child's life since an early age, having a role in play and as a development stimulus.

> [...] The dance activity at school may develop, in the child, an understanding of one's movement capability, since the child will grasp a better understanding of how his/her **body** works. Thus, the child will be able to use his/her body in a more intelligent, self-assured, responsible and sensible manner (Brasil, 1997, p. 49).

That is, in agreement with Lelis (2004), Art, today, encompasses more roles:

> These days, art at school contributes not only to the development of subjectivity, but also to professional development. Large numbers of school graduates seek professional positions in the sales environment (advertising, marketing, design). This is only made possible due to the analytic capacity to appreciate art in its historic context, These issues are inherent to the teaching of art. (LELIS, 2004, p. 43).

Communication and expression through music are suggested in the PCN's through the perception and identification of the musical language elements in production activities, translated by employing the voice, the body, and sound-making materials and instruments available (p.55). Body language is also explored in the PCN's through drama-related activities:

> Experiments and articulation among **body,** material and sound expressions. Exploration of **body** capabilities and drama creation. [...] Understanding of the theatric creation's **body,** text, visual, sound expression contents (Brasil, 1997, p. 59).

The possibility of art being explored in closer proximity with cross-functional themes –cultural plurality – can be seen in several excerpts of the document, such as:

> Artistic expression comprises vivid examples of peoples' cultural diversity and shows the artists' all-time creative wealth from everywhere. While in contact with such productions, the elementary school student can make use of his/her cognitive, sensitive, affective and imaginative capabilities, brought together around the artistic and aesthetic learning. At the same time, his/her **body** moves, his/her hands and eyes acquire skills, hearing and speech are enhanced, while the individual develops activities in which the interpersonal relationships are constantly intertwined with the social experience (Brasil, 1997, p. 74).

The excerpt above suggests that the teaching of art must establish the concept of contribution to the educational process, respecting the school community's and the family's cultural and aesthetic standards, and at the same time, work to expand the concept of art in the sense of cultural plurality.

> In order to help students think and act in a responsible manner with regard to the **body** and to sexuality, there are artistic and aesthetic processes that can be worked on in the art class. On this issue, one can review critically the concepts and prejudices that stand out on: similarities and differences in preference and rejection with regard to taste and personal choices, for example, on wardrobe, beauty enhancements, men's and women's **body** expressions at various ages, within various ethnic groups and at various times, as they present themselves in art and in day-to-day life (Brasil, 1997, p. 40).

Through art, the PCN's may redeem themselves of the sexuality issue, since in science, the approach to the theme almost always occurs from the standpoint of disease. Here, the proposal is that sexuality is seen through an integrating notion, respecting the differences between men and women.

There is no question that art is not the only way to reflect on the body with the students. Rather, it is but one of the avenues. Art does not depend on specific knowledge only. It also depends on the experience one has with the senses, perception and sensitivity, that is, with the body.

- **Physical Education on PCN – The articulate body:**

Physical Education, according to the MEC's [Education Ministry's] indication, should be taught at all grades, from 1st to 8th, and not only from the 5th to the 8th grades, as was the case previously.

> The Physical Education work throughout the initial grades of elementary school is important, since it enables the students to have, since an early age, the opportunity to develop **body** capabilities and to take part in cultural activities, such as games, sports, wrestling, gymnastics and dance, for leisure and to express their feelings, affect and emotions (Brasil, 1997, p. 15).

The body, in the context of the Physical Education document, gradually takes shape, as other contents and reflections are introduced in the teaching process. As a matter of fact, the knowledge of the body makes it possible to understand the associated subject matter.

> The knowledge on the **body,** its growth and development processes, is pieced together along with the development of **body** practices. These processes and practices provide the subsidies for the acquisition of good nourishment, hygiene and physical activity habits, and also for the development of the individual's body potentialities. They enable the individual to understand such potentialities as fundamental human rights (Brasil, 1997, p. 25).

According to the PCN's, the contents must be approached from experience, that is, the student must, by means of a variety of exercises, analyze and understand the changes that take place within his/her body, such as, for instance, during and after physical activity.

> Analyses can be performed on short-, medium-, and long-term changes. In addition, from the standpoint of perception of one's own **body**, the students will be able to review their movements in time and space: what their displacement is like, what is the speed of their movements, etc. (Brasil, 1997, p. 36).

In spite of the fact that the body phenomena (anatomical, physiologic, bio-chemical) have to be approached in the context of Physical Education, the document does it so as to incorporate these aspects to the perception of one's own body (by analyzing movements and reactions, observing development and changes, etc.)

Such care is necessary and corroborated by means of Nóbrega's statement:

> In order to know the body, breaking it down into parts or functions is not enough, even when one recognizes the contribution that various specialties, such as anatomy and physiology, have added to such understanding. The body is not a thing, or an idea. Body means gesture, sensitivity, creative expression (2007, p. 88).

Isto significa pensar na Educação Física com o apoio das contribuições de Almeida, quando afirma que: "O que se pretende afirmar é que o corpo tem uma grande capacidade de criação; logo, é possível pensar as práticas corporais criadoras, produzindo assim uma existência intensa" (Almeida, 2006, p. 11).

The body in the PCN's – Physical Education – is seen in an articulate manner, balancing biological contents with other instances that are also so necessary – emotional, aesthetic, ethical, and creative. This means thinking of Physical Education with the support the contributions by Almeida, who states: "What one intends to state is that the body has great capability for creation; thus it is possible to think about the creative body practices, thus producing an intense existence" (Almeida, 2006, p. 11).

- **Cross-Functinal Themes – Ethics in the PCN 's – The controllable body:**

Reflecting on this theme with Foucault's theoretical foundation, I noticed that, for the author, ethics ceases to be the study of the moral judgements associated to human conduct based on a code to be the manner in

which the individual puts her/his own self together as the subject of his/her own actions. In addition, he states that ethics of care is a life exercise, pervading the whole process of our existence, personal and social development principles, which start with the care with ourselves and progresses alongside with our duties in society.

> The individual, for a long time, was authenticated through others' reference and through the statement of his/her attachment to others (family, loyalty, protection); at some point (the individual) started being authenticated by the discourse of truth that he/she was able to (or was obliged to) have about him/herself (Foucault, 2007, p. 67).

The exercise of sexuality was dealt with in the official document with the use of examples according to which, according to the PCN's ethical behaviors would or would not expressed.

> [...] The expression "**sexual abuse**", for instance, means to take advantage of another person, seeking pleasure in a selfish manner. In this sense, it does not encompass only the violent acts, such as rape, but can also be present in more ordinary ways, such as, for instance, disregarding the partner's wish for caresses and pleasure. The serious sexually transmitted disease, **AIDS,** also brings about very clearly the moral value of mutual respect. To protect oneself from the disease is not only a commitment to one's own health, but also to that of the sexual partner, since contamination is possible (Brasil, 1997, p. 82).

Even though sexuality is mentioned, the approach is quite superficial and sexual abuse, which is such a complex issue, is mentioned in a purely technical manner, limited to the meaning of the term.
Sexual abuse has a very significant impact on the child's and on the teenager's physical and mental health. It leaves marks on the person's development, with damage that may be lifelong in character. It should be seriously discussed in all segments of society, including at school and in the family.
Thus, the PCN's opportunity to deal with something so complex, and unfortunately, present in our child population, is lost. Something similar occurs with AIDS, which, even though it also appears in the PCN's of other areas, pegs sexuality to the idea of risk, without taking care to show possibilities of discussion of the various questions involved in the context of the syndrome.

- **Cross-Functional Themes – Health and the Environment – The untouchable body:**

Among the great current challenges in the health sector is the one related to the transformation of the concept, which is still thought of and taught from the disease point of view and with a vision that is totally biomedical and mechanical, into a perception that would encompass, for instance, cultural aspects.
The challenges are no smaller with regard to health in the school environment which, historically, was built according to a doctrine that only seeks to reduce the dropout and fail rates, and provide medical care for the "deviants". It is believed that thus, proper conditions for learning are assured.
The official document provides some recommendations on health, for the students and for the teachers themselves, with a note to the effect that the indications should not be an imposition: "One important guideline is that one should avoid a prescriptive approach, as if the institution's goal were to normalize the student's private life and standardized behaviors" (Brasil, 1997, p. 18).
With regard to the teacher's capability to deal with the concepts of health and sickness, a number of studies make it clear that the education sector has failed to provide this support.
For all practical purposes, what one normally sees are contents on the theme offered based on the teacher's own perceptions, that is, common sense concepts.

> [...] in the absence of proper training, these programs are developed, for the most part, based on the teacher's "common sense". Such "common sense" is, in fact, a composite of common sense concepts bundled up with the middle class ideology about the living conditions and the knowledge of the social groups which occupy a lower position in the economic totem pole (Collares, 1985, p. 14).

Education in health, as I see it, is always associated to the idea of change, that is, prescriptive contents that are meant to change something, working on the assumption that previous knowledge is necessarily wrong. This appears in contrast with other bodies of knowledge which are pieced together based on incorporating, enhancing, adding, acquiring.

The body appears in the Cross-Functional Theme – Environment, only due to the possibility of integration into the Physical Education course, in which the relationship with the environment is highlighted: "[...] Physical Education, which helps so much towards an understanding of the body's expression and self-knowledge, of the relationship between the **body** and the environment and the development of sensations" (Brasil, 1997, p. 194).

Thus, one notices that several possibilities of discussions about the body and the environment were ignored (the relationship with nature, with the outcome of the climate change, sustainability, among others).

- **Cross-Functional Themes – Cultural Plurality and Sexual Orientation – The helpless body:**

According to Macedo (2006), the PCN's highlight cultural plurality. Nevertheless, contemplating the theme at several instances within the document does not mean, necessarily, as the author cautions, that the required underpinnings are there for the construction of a difference policy.

> One cannot deny the importance given by the PCN's to cultural plurality. In addition to a cross-functional theme dedicated to this issue, there is, throughout the document, from the minister's initial speech and onto the scope of elementary school and of most courses, a concern to highlight the cultures make up the country's foundations (Macedo, 2006, p. 164-165).

It is clear that Brazilian society is not made up only by different ethnic groups, which is facilitated by the country's continental dimensions, but also by immigrants of a variety of countries, who bring the cultural diversity of their origins. By the same token, one knows that the regions within Brazil have considerably diverse cultural characteristics and that the relationship between groups in the various cultural environments is often marked by prejudice and segregation.

> The theme of Cultural Plurality is about knowing and valuing the ethnic and cultural characteristics of the various social groups that share the country's territory, the socioeconomic inequalities and the criticism to the **discriminatory** and **exclusive** social relationships that pervade Brazilian society, offering the student the possibility of knowing Brazil as a complex, multifaceted and sometimes paradoxical country (Brasil, 1997, p. 19).

For the body, the text provides possibilities through the various cultural expressions:

> Going on to the study of world visions, relationships with nature and with the **body,** within different cultures, introduced in different manners at different times, it will be possible to explore the creative and innovative potential that is a characteristic of the human being (Brasil, 1997, p. 55).

With regard to sexuality, it is present in several spaces in our day-to-day life. It is present at school, at work, during informal conversations, and pervades, at an increasingly early age, the life of children, thus becoming a subject to be dealt with in the classroom; it is a theme of chapters of the schoolbooks, as well as of music, dance and play at the schoolyard during recess.

> There is also the clear presence of the **sexuality** of the adults who work at the school. One can see, for instance, the students' great disquiet and curiosity brought about by a pregnant teacher. [...] The **school,** whether it wants it or not, faces situations in which it **intervenes.** Be it in the classroom's day-to-day activities, when it forbids or permits some behaviors instead of others, be it when it elects to let the parents know about their children's behavior, the **school** is always conveying certain values, more or less inflexible, depending on the professionals involved at that particular moment (Brasil, 1997, p. 77).

For some researchers, the fact that sexuality corresponds to one of the Cross-Functional Themes, means the possibility of advancement. Nevertheless, for Altmann (2001) it is possible to criticize the PCN's text in a number of ways. For the author, sexual orientation in the PCN's is perceived as being, basically, something for information purposes, and sexuality is seen as a mere "piece of information on nature". Sometimes the expression "basic requirement" is mentioned, as opposed to a historic and cultural perspective on the issue:

It is seen from the biologic standpoint, pegged to the hormonal functions. With regard to the erotic experimentation, curiosity and desire, these are considered common when dealt with alongside with a partner. The erotic potentiality from puberty onwards is seen as being centered around the genital area, while, only a pre-genital exploratory character is accepted during childhood (Altmann, 2001, p. 581).

Even though sexuality is dealt with in other subjects and Cross-Functional Themes – Natural Science, Physical Education, Arts, Ethics and Health, the contents that deal with conception, gestation and childbirth as normal body processes, are approached only in Natural Science and in the Cross-Functional Theme Sexual Orientation (for the 4 cycles) and in the Cross-Functional Theme Health (only for the last cycles).

> With the same degree of care, the **body** transformations that occur during puberty, the **conception, pregnancy and childbirth** mechanisms, as well as the existence of **different contraceptive methods,** and their action in the male and in the female **body,** must necessarily be dealt with. All these items are worked on so that, while they refer to a person's individual **body** processes, one can also think of them in the relationship with other persons, emphasizing the aspect of the ties established throughout one's life (Brasil, 1997, p. 97).

In the same manner associated with the explicitation of contraceptive methods, that comes up only twice in the PCN's: in the document related to Natural Science from the 1st to the 4th grade (which mentions contraception without specifying any method), and here, in the Sexual Orientation Cross-Functional Theme (for the 1st to the 4th grade, the term "condom" appears, and from the 5th to the 8th grades the de terms "condom" and "rubber" appear). This is an indication of something quite astonishing and contradictory, since the document refers, countless times to contagium in the context of sexually transmittable diseases and to the occurrence of unwanted pregnancies during the teen years.

Nevertheless, in spite of the fact that AIDS, STD's and unwanted pregnancies are mentioned in most documents herein reviewed, the contraceptive methods, and specifically the condom, are not mentioned in most PCN's, and curiously even the Cross-Functional Theme associated to Health goes unmentioned.

As I see it, it looks like there is clearly a denial of children and teenager's sexual activity, and, instead of coming up with contents on what could be effective prevention, there has been a choice for silence in the PCN's.

The PCN's, in addition, highlight something that indicates the school's as well as the teachers' difficulty in dealing with the issue:

> **Sexuality** within the school's environment is not only written all over the toilet cubicles' doors, internal and external walls. It **"invades"** the **school** by way of the students' attitudes in the classroom and the social interaction among them. Sometimes the **school** issues a request, impossible to be complied with, that the students leave their **sexuality out of the school's premises.** (Brasil, 1997, p. 292).

The document presents the teacher with yet another significant challenge: it proposes that the Sexual Counseling work also help prevent serious problems such as sexual abuse.

> In order to prevent **sexual abuse** among children and young people, one must favor the appropriation of the **body,** promoting the awareness that one's **body** is his/her own, and should only be touched by another person with one's consent or for reasons of health or hygiene. This helps strengthen self-esteem, and, as a result, the inhibition of submissiveness to others (Brasil, 1997, p. 293).

Upon suggesting such objectives, as I see it, the PCN's minimize the problem of violence against children and hold them responsible for something that, as a number of researchers indicate, is happening with increasing frequency, within the home environment, involving people that are close to the children, and people who the children trust.

With regard to the image that the child pieces together of his/her own body, the PCN's show some influence of the standards imposed through several means, highlighting, especially, the power of the media.

> The educator may use a number of materials to this end (didactic, scientific, artistic, etc.), reviewing and comparing the approach to the **body** from the standpoint of science and advertising, for instance; discussing and questioning the use of a certain **aesthetic standard** promoted by the media. The

educator may also encourage the production (both individual and as a group) of the representations that children have of the **body,** by means of drawings, assemblies, models, etc. (Brasil, 1997, p. 98).

In more than one opportunity herein, I was able to discuss the issue of appearance, of the standards promoted by the advertising industry and pursued, but not necessarily achieved, by people. By the same token, this is about what being a far cry from the model sought may mean to people.

> The human body, the last territory to be conquered, understood and controlled, thus presents itself as a preferred field for the trials of biotechnology and the market economy investments, exactly as it is strengthened by a paradox that characterizes industrial societies: on the one hand, there is the cult, the infatuation, the high value assigned to appearances and health; on the other hand, the fragmentation of the organism and the expanding therapies, the dispersion of cells, genes and organs, in addition to the large-scale marketing of these materials (Sant'Anna, 2001, p. 76).

It is of utmost importance that the syllabus promote an education that leads the student think, in a critical manner, about everything that is offered to him/her, passing judgement, assigning value to whatever brings growth and personal development. Thus, education may lead the individual to achieve better knowledge of his/her own body, making him/her sensitive to the singularity of his//her sensations and enabling him/her to have a higher degree of body identity.

- **Cross-Function Thenes – Work and Consumption – The shaped body:**

The existing relationships among men in society may be analyzed in several ways. Such diverse relationships define, as time goes by, what will be essential, turning into na object of desire. The PCN's deal with these issues as a Cross-Functional Theme to be thought from the 5th to the 8th grade.

> The discussion over work and consumption at school seeks to define the social relationships in which the needs and desires arise, and the services that will meet such needs. Knowing and discussing ways to achieve and organize work and consumption, understanding their relationships, dependencies, interactions, the associated rights, the contradictions and the values associated to them, will help the individual reach an understanding of his/her own reality, and put together a favorable image of him/herself, as well as a critical attitude, to enhance the value of forms of action that facilitate better distribution of socially produced wealth (Brasil, 1997, p. 344).

It is important that young people discuss their expectations with regard to work. Many of them have already taken part in the job market, in one way or another, and are going through the expectation of the beginning of the definition of a professional avenue or the quest for the first job.

The relationship between the body and the work was dealt with in a paragraph of the official proposal, as a warning on the possibility of accidents:

> It is important to know, for instance, that a workplace accident is the one that happens while performing the work in the employ of a company, or while special policyholders are working, resulting in **physical injury** or **functional disturbance** that leads to death, loss or reduction of the ability to perform work, either temporarily or permanently. (Brasil, 1997, p. 399).

The official document proposes that the Work and Consumption Theme be, once again, developed by the Physical Education area, while mentioning aspects on the body's appearance.

> In Physical Education, the Work and Consumption Theme appears to be contemplated starting with its scope: one of the capabilities to be achieved by the students is the recognition of **working conditions** which undermine the growth and development processes, not accepting such conditions for him/herself or for others and claiming decent living conditions; another capability is related to the knowledge of the diversity of **health, beauty and body aesthetics standards,** which are present in different social groups, reviewing the standards promoted **by the media,** avoiding consumerism and prejudice. (Brasil, 1997, p. 370).

This body model recognized and legitimized by the media values, for the most part, physical characteristics, adding no value, for the construction, alongside with youth, of the need and the quest for reflective, critical references, sensitive to other features.

On this issue, Fischer (1996) contributes, clarifying that:

> [...] the need for an analysis that may place us in this present juncture in which the image, the fact that something "has been seen on TV" or has been awarded any space in the newspapers and magazines printed media", empowers, causes an effect on people, pieces together a special kind of truth (Fischer, 1996, p. 126).

Thus the various media provide a ready-made idea of what we should be, what we should consume, how we should behave, and maybe, what is really important for us to know.

Given the fact that the students' and even the teachers' references are pieced together based on the images and data shown by the various media, pedagogical practice shows that an education that does not have a face-to-face dialog with these elements may become innocuous.

Nevertheless, the biggest problem appears when, instead of promoting dialog, of approaching the student's day-to-day life, education only begins to duplicate the media's discourse, strengthening stereotypes, discourse, lifestyles, failing to encourage a critical reflection about whatever comes in through our eyes and ears, and, in fact, about whatever comes into our body.

CONCLUSION

Public policies entered into the Nation-wide Syllabi Parameters embody the commitment to produce certain types of individuals. This is a complex process, pieced together from diverse interests and having, as its foundation, a massive production of truths, powers and bodies of knowledge originating from a variety of fields.

If, within the school, the biomedical discourse is still given priority and assigned to body issues (anatomy, physiology, organs and systems) at the present juncture, one must think of the syllabus while showing commitment with social changes and discuss the body as one's own space, considering age, race, gender, creed identities....

PCN reviews showed significant differences among the body-related guidelines contained in the subjects studied.

The truths about the body have been pieced together by way of a discourse produced on the borderline between several pedagogic avenues. They exert the effects of power and knowledge on each one of us: students, teachers, parents, other family members and professionals of several areas.

Being able to become familiar, in greater depth, with Foucault's writings on the body, power, knowledge, discipline and self triggered, in me, other possibilities, of resistance, struggles, reflections, with regard to what lies before us. It also enabled me to devise other ways of thinking and working through education of and in the body.

In the hybrid entity that make up the PCN's the body becomes an issue of option among the various possibilities presented to the students.

Natural Science, Physical Education, Art, Health, Environment, Ethics, Sexual Orientation, Work and Consumption, Cultural Pluralism – in this subdivided space, the body is inserted, presented whole, master of its own self. At other times is appears to be shy, hesitant, uncertain of its own existence.

Ethics sets out to control the uncontrollable. In the same discourse, it attacks and defends standards and rules, without, nevertheless, giving away any space so that the students may develop attitudes that are more solid and in keeping with day-to-day reality.

The PCN's for Sexual Orientation show, between the lines, and in what is left unsaid, the strangeness that this issue generates within the school environment. The discourse's intent becomes evident – to control sexuality through fear and the concept of fear, thus exposing a helpless body. In the Cultural Plurality, a relationship among the differences is proposed but they do not dovetail.

Health and Environment refer to an untouchable body. That is a body pulled away from reality, from daily life and from the school's challenges. Health, which constantly warns about AIDS and unwanted pregnancy, falls silent when it comes to recommend the use of condoms. In Environment, there is little emphasis on the body's actions in nature; by the same token, the consequences of the environment's actions on the body are precariously discussed.

The shaped body found in the Work and Consumption Theme warns the school to the effect that it must not reproduce the media's discourse, which prescribes a way of life. On the other hand it fails to show how the

institution will be able to encourage critical reflections on the theme, among the students. Furthermore, many discussions that have already taken place on the workforce, capitalism, the exploitation of man, challenges for the youth in the job market, among so many other struggles of our time, are ignored.

The Cross-Functional Themes also made me think about the manifold responsibilities of the teacher, who, being provided with qualifications that are often restricted due to several issues, will also have to deal with the contents of others areas.

In the body's sweetness-utility, multiple selves are imbedded; they adjust themselves to the invisible alignment; producing truths and questioning – as much as possible – power and knowledge; make headway while having their underpinnings and quirks reviewed, by the examining device known as the school and remain under the watchful eye of the panopticon which the PCN's often become.

273 - REFORMULATION OF UNDERGRADUATE COURSES IN BRAZIL: NEW DIRECTIONS?

Joana Paulin Romanowski[1], Pura Oliver Martins[2], and Simone Manosso Cartaxo[3]
Pontifícia Universidade Católica do Paraná – PUCPR
[1]joana.romanowski@gmail.com, [2]pura.oliver@pucpr.br, [3] simonemcartaxo@hotmail.com

Abstract: This paper contains the investigations results related to the research project, The disciplines in teaching undergraduate courses: Tensions and priorities initiated in 2007 linked to the research line: Theory and Pedagogical Practice in Teacher Education of Graduate Program in Education of the Pontifical Catholic University of Parana - Research Group: Educational Praxis - Dimensions and Processes. The research focuses on the reformulation of under-graduate courses in universities in the state of Parana, Brazil. The research problem arises in the context of reformulations in the under-graduate courses encouraged by the demands of current educational policies for these courses, with the following questions: What changes to current policies of teacher education were produced in the organization of under-graduate courses? What features characterize the proposed articulation of pedagogical training with training in specific disciplinary perspective of professional development? The overall objective was to analyze the reformulations of the under-graduate courses in relation to established priorities and the implications to the professional development of teachers indicating the tensions caused in this process and to indicate alternatives that contribute to the improvement of basic teacher education. The methodology of the study considers the assumptions of the theory as practice of expression (Martins, 1996; Santos, 2001), performs the analysis of educational legislation, organization of curriculum matrices of under-graduate courses at universities in the State of Parana and includes interviews with coordinators and teachers from the course. Preliminary results show that the courses differ in the composition of the curriculum matrices in each of the institutions examined. This means that the tensions and priorities generated at each university in the constitution of the identity of the under-graduates courses are disparate from the proceedings in which these courses are instituted because of the institutional clashes priorities. It is noteworthy that the reformulations in private institutions meet the recommendations of the legislation, while in most public reformulations occur with less intensity, however, changes are restricted to enhance technical training, also found in studies of Terrazan (2004); Diniz Pereira (2010), Dias-da-Silva (2005). The performed reformulations extend the amount of teaching time for teaching practice, starting from the first year of the course, in the form of professional practice and in the final years the completion of supervised practice. However, the university remains far removed from the elementary school, the academic disciplines do not articulate these practices. It is noteworthy that the under-graduate courses in Brazil have been the subject of debates and proposals, since the 1980s (Candau,1988; Ludke,1994; Pimenta,1993) related to the conjuncture of teacher devaluation, offer of lighter courses, disjointed from basic school and agravated with the little institutional interest in these courses.

INTRODUCTION

THE CONTEXT

The courses and policies for teacher education in Brazil since the establishment of teacher training courses (normal schools) to train teachers for primary education in the mid-nineteenth century, and undergraduate programs in 1934, have the institutional organization and defined curriculum by government agencies, as well as control and evaluation of its operation. Research, studies and analyses performed in recent decades, investigate and analyze these policies and training practices conducted by these courses regarding the institutional conditions, the formative processes, the curriculum organization. The research identifies problems in supply conditions, practice tendencies.

Research conducted in the 1990s[76] confirm the criticisms and complaints made since the 1980s[77] about the degree courses, indicating the permanence of the departmentalized university structure preventing collective

---

[76] The state of the art on theses and dissertations on Romanowski (2002) course degrees presents a set of analyses carried out on theses courses.

[77] The studies of Balzan and Paoli (1988) on the disintegration between the areas of content and of pedagogical training, the study of Candau (1983) published under the title of New Directions of the Degree Courses, examined the views of teachers and under-graduates, the experiences developed in the courses, aiming subsidies for the overhaul of the course.

discussions to overcome the existing dichotomies. Not even the institutional restructuring has allowed an organic articulation of the degree courses, in some cases they have reduced and restricted the inclusion of teachers in the pedagogical area in the definition of the degree courses, augmented by an expansion with lower costs, as Taffarel (1993) points, by the power struggles within the institutions Diniz-Pereira (2000).

The curricula are linear, giving value to the pragmatic and immediate training, priorizing training for "training". Summary of the issues prepared by Pimenta (1993, p. 129) points that:

a) training in specific areas has not been considered as part of teacher training process. Consequently, the Institutes have, in their curricula, separate teacher preparation and professional preparation in the specific area, concerned more with the latter and delegating the first to other bodies, not assuming it as their responsibility;

b) consequently, teacher training has been under the sole responsibility of the Colleges of Education. This view, brings with it a split between pedagogical training and the specific training in the area, when the desirable would be the articulation between the two;

c) within the pedagogical part, it is also found the various dimensions, be among the very foundations of education, be between them and didactic-methodological foundation, and still between those and the practice of teaching;

d) often, the undergraduate courses have ignored the reality of the professional practice, losing sight of the social demands for the same.

The consolidation of this structure has turned these hybrid and desintagrated courses (Gatti, 1997), resulting from the division into two training areas (the specific content and pedagogical content), organized in two stages (theoretical foundation and professional initiation done during internship), two training areas, the training institutions and professional work. All of this is aggravated by the historical devaluation of the teacher's profession.

In many institutions the bachelor degree courses are the first created, that is, they are the ones which allow the origin of the institutions, ensuring their sustainability and institutionalization, however as they are expanded they are being bequeathed to the background, and other courses of higher social prestige become more valued, both in the distribution of resources in the institutional budget as well as in the demand of students.

In addition, the learning of specific content by students do not get satisfactory results. This situation occurs mainly in the exact sciences area handicapping future professional activities of the undergraduate. The mastery of the specific content by the students, does not happen during the training course, either by the approach directed to the training of the BA, or by the own learning condition. Research have shown discouragement, disbelief in the expanding profession evasion. Teacher education programs are among the least disputed as shown by the indexes candidate / vacancy for college entrance exam (vestibular[78]), the ones with the least institutional prestige as pointed out by Pereira (2000). Adding up, there is also the socio-economic condition of the students who need to work during their studies, but which is not always related to education. Census data confirm that the expansion of enrollment in the new training courses for teachers is more pronounced in isolated institutions, of a private administration, offering courses at night (Romanowski, 2003).

In the 1990s, a new Law of Directives and Bases of National Education – LDBEN was approved and promulgated, LAW 9394/96. The changes defined by this law, related to teacher education, include the requirement for graduation in college courses, degree courses, for teacher practice in elementary and middle schools[79].

Once the new law was approved, a long debate was established. involving the Ministry of Education - MEC and the National Education Council - CNE, associations of researchers and institutions to establish new guidelines for teacher training courses. These guidelines were defined in accordance with Resolutions 1 and 2 of the CNE in 2002, and higher education institutions were responsible to reshape their courses.

In the historical evolution of the degree course the author shows the conflicts of the passage of the Philosophy Colleges to the Education College, done in the education reform of the 1960s, emphasizes Valmir Chagas' technical view package.

[78] *Vestibular* refers to the generic name of the selection process exam for the access to higher education, to which students with high school education are submitted.

[79] Pre-school includes childhood education from 0 to 5 years old, elementary and middle school lasts 9 years and high-school lasts three years.

Among the major changes in undergraduate courses, Resolution CNE/CP No. 1 indicates in its article 3 as guiding principles of teachers preparation for professional practice:

    I – competence as nuclear conception in course orientation;

    II – coherence between the offered training and the expected practice of the future teacher;

    III – research, as focus in the teaching and learning process, since teaching requires, both to have the knowledge and to mobilize it for action, like to understand the process of knowledge construction.

These principles refer to a training process in close relation with the context in which the professional practice is effected. This became evident with the approval of Resolution CNE/CP No. 2 which deals with the minimum credit hours of the undergraduate teaching courses, as well as their distribution in theoretical lectures, practices, internships, and complementary activities which were defined as follows: Courses credit hours will be effected by the completion of at least 2800 (two thousand and eight hundred) hours, as follows: 400 hours of practice as a curricular component, experienced along the course; 400 hours of supervised curricular internship starting at the beginning of the second half of the course; 1800 hours of classes of the curriculum contents of a scientific and cultural nature and 200 hours for other forms of academic-scientific-cultural activities.

THE RESEARCH

The research done focuses on the reformulation of teaching courses held in public and private universities located in southern Brazil. The purpose of this investigation was to analyse the reformulation of the undergraduate courses in relation to established priorities and the implications with the professional development of teachers indicating the tensions originated in this process as well as to indicate alternatives which contribute to the improvement of teacher training.

The methodology performs the analysis of the educational legislation, organization of curriculum matrices of the undergraduate courses, includes interviews with coordinators and teachers of undergraduate courses. For the analysis, it considers the theory premises as an expression of practice, theory is the expression of a specific practice and not of any practice (Martins, 1996; Santos, 2001). In this paradigm, the practice is not driven by theory, but theory is going to express the practical action of the subjects. They are the modes of acting which will determine the thinking ways of men. "The theory thinks and understands the practice about things, not the thing. Hence, its only function is to indicate possible ways, never to govern the practice" (Bruno, 1989:18). The base of knowledge is the practical action that men carry through social relations, by the institutions. The basic assumption is that "man does not reflect about the world, but he reflects his practice about the world. (Bernardo, 1977, v. 1, p. 86). Thus "... knowledge is always knowledge of a practice, never the natural or social reality. "(Santos, 1992:29). The data were collected during 2008 and 2009, and they were taken as reference to the instruments used in the research "Dilemmas and Perspective for the Educational Innovation in Basic Education and Teacher Training (DIPIED)", coordinated by Professor Eduardo A. Terrazan

We investigated five universities, thirty seven undergraduate courses. The courses examined are indicated as follow: (i) Portuguese-English Languages and Literature; Portuguese-Spanish Languages and Literature; Pedagogy[80]; Biology; Philosophy; Physical Education and Mathematics from ALFA[81] (ii) Biology; Physical Education; History; Portuguese-Spanish Languages and Literature; Portuguese-English Languages and Literature and Mathematics of BETA; DELTA Visual Arts, Pedagogy, History, Portuguese/Spanish Languages and Literature, Portuguese/French Languages and Literature, Portuguese/English Languages and Literature, Music, Physics, Geography, Mathematics, Chemistry, Biological Sciences, Physical Education, Long-Distance Geography, Long-Distance History, Long Distance Portuguese/Spanish Languages and Literature; in EPSILON the Pedagogy courses, History, Portuguese/French Languages and Literature, Portuguese/English Languages and Literature, Music, Physics, Geography, Mathematics, Chemistry, Physical Education, Philosophy. The interviews involved seventeen course coordinators and ten teachers.

---

5 The Pedagogy course is aimed at teacher training for early childhood education and for the five initial years of the elementary education. The remaining undergraduate courses are for the last four years of the elementary education and for the three years of high school, but these teachers can also teach in early childhood education and in the first four years of the elementary school.

[81] For this work the investigated institutions are shown by Greek letters, since the group opted in not identifying the institutions in order to preserve the anonymity and secrecy of the information. For this, Greek letters were used. Care was also taken not to present the information in the same order in that the research is contextualized.

In the analyses it was considered the curriculum composition around subjects and their workload, as well as the testimony of coordinators and teacher from undergraduate courses through interviews. The interviews involved seventeen course coordinators and ten teachers. In the sequence, the text expresses the synthesis of the results and the analyses performed on an interim basis.

THE ANALYSIS: Which changes signal the reformulations of the undergraduate courses?
The aspects which were considered in the analysis were directed to indicate: the constitution of the identity of the undergraduate courses in the institutions researched; the priorities in teacher education introduced in the composition of the curriculum matrix; and the appointment of new areas of teacher education as training for the inclusion. The examination of proposals for undergraduate courses divulged in the researched universities disclosed the following: the distribution of the specific disciplines and of the pedagogical disciplines; the workload for each field of training; the distribution of practices and supervised internships; and the offer of academic and cultural activities.

The preliminary results of the investigation undertaken up to now, indicate that the courses differ in the composition of the curriculum matrices in each of the institutions examined. This means that the tensions and priorities generated at each university in the constitution of the identity of the undergraduate programs are mixed: three universities established a general coordination to monitor and promote the redesign of undergraduate courses and three left the redrafting in charge of the collegiate course.

The curriculum organization of the undergraduate courses from one of the universities (ALFA) has a higher workload of about 3200 hours, 400 hours more than in the workload defined in Resolution No. 2, CNE/CP, 2002. In this resolution the workload is of 2800 hours. This larger number of class hours is due to the inclusion of institutional disciplines which are compulsory in all courses of this university. These disciplines aim to provide a humanistic and social welfare education.

In another private university the courses strictly adhere to the guidelines recommended of 2800 hours. In the other public institutions, the load is varied: some courses have a workload of 2800 hours, some other courses have a higher load of up to 3700 hours in the Pedagogy courses.

The emphasis of the curricular proposals in this institution has the same logic of distribution in the fields of training in specific disciplines, around 60% of the workload; the pedagogical disciplines revolve around 12%, covering the disciplines of Foundations of Education, Organization and Management of School, Learning Fundamentals, Curriculum and Teaching Building Action and specific Teaching Methodology. The disciplines of professional practice add up to 400 hours, around 14% of the total course load. The internship also sums 400 hours. Thus, the practical disciplines make up almost 30% of the course load. This accentuated practice load may emphasize a training directed to practical rationality, focusing on know-how, an economistic perspective devoid of political, critical and analytic training (Moraes, 2003).

The Pedagogy course – at ALFA University presents a different workload considered the nature of the training disciplines. There are 126 hours of professional practice disciplines, 360 of internship, 100 hours of cultural-academic activities and the institutional disciplines. The pedagogical disciplines total 2000 hours emphasizing the teaching methodological disciplines which total 1134 hours.

Beta University, a private institution, has a distribution with the following discipline characterization: the ones for research training, the ones specific for research, the ones for teacher training for working with students' special needs, the pedagogical ones, the cultural-academic activities, the ones for internship and the ones for interdisciplinary studies. It is pointed out that the curricular organization is not the same for the set of courses, even though the majority presents a workload of 2800 hours.

The Biology course at BETA University, has a total of 3100 hours which are divided in 108h of training for research, 270h of pedagogical disciplines, 108h for the academic-cultural activities, 1836h of specific ones, 414h of supervised internships, 166h of specific ones for research, 18h of disciplines for special needs and 180h of interdisciplinary studies.

The Physical Education course has a total of 2800h among them there are 630h of pedagogical disciplines, 108h for the academic-cultural activities, 1332h of specific ones, 414h of supervised internships, 106h of specific ones for research, 18h of disciplines for special needs and 180h of interdisciplinary studies.

For History at BETA University there are 536h of pedagogical disciplines, 216h for the academic-cultural activities, 1386h of specific ones, 414h of supervised internships, 72h of specific ones for research and 90h of interdisciplinary studies.

For the courses of Portuguese-English Languages and Literature and Portuguese-Spanish Languages and Literature there are 2800h, distributed in 432h of pedagogical disciplines, 216h for the academic-cultural activities, 432h of supervised internships, 54h of specific ones for research and 90h for interdisciplinary

studies, which is different from one to the other, as there are the specific disciplines where in Portuguese-Spanish there are 1512h and in Portuguese-English there are 1548h.

And finally, the Mathematics Course has a total workload of 2800h, of which 1206h are for specific disciplines, 486h of pedagogical ones, 216 for the academic-cultural activities, 432h of internships, 72h of specific ones for research, 18h for interdisciplinary studies and for specific ones.

BETA institution complies with what is determined in the resolutions about the undergraduate courses and maintains an offer of a minimal workload of 2800 hours. It is highlighted the offer of a discipline directed to inclusive education with a restricted workload, but it allows to the undergraduates to have contact with the question. It is also highlighted that in this institution the curriculum contemplates the offer of interdisciplinary disciplines, which configures a curricular innovation.

DELTA University has a composition of the curricula of the undergraduate courses indicating Visual Arts, Pedagogy, History, Languages and Literature, Music, Biology, Physical Education with a workload of approximately 3,300 hours, that is, it is superior to the indicated in the Resolutions of CNE/CP n° 1 e 2, 2002. For these courses the workload is of approximately 3,300 hours. Geography, Chemistry and Physics courses are the ones which have the lowest workload, of about 2900h.

At DELTA University the workload distribution in the disciplinary areas present a significant variation. In the Visual Arts, Music, Mathematics courses there are approximately 900 hours of disciplines destined to the pedagogical training and 1450 hours of specific disciplines. In the History and Language and Literature courses the pedagogical disciplines are about from 200 to 270 h.

In regard to the professional practice disciplines there is also a variation among the courses, since History, Mathematics, Physics and Chemistry do not have those; the Pedagogy one includes 102h, Languages and Geography have 272 hours of practice. In these courses the amount of hours is lower to the one determined in the resolution about undergraduate courses. Other courses exceed the recommended amount, like, Visual Arts with 680 hours, Biology with 748 hours, Physical Education with 816 hours, and Music with 1020h. It is necessary to verify if these professional practices are specifically directed to teacher training. For example, in the case of Biology the laboratory practices expand the knowledge in the specific area. This knowledge do not oppose to teacher training, since they are necessary knowledge to the teacher, however, they reinforce the bachelor's performance where the practices are destined to the development of research and are not articulated to the necessary practices of teaching Biology.

Regarding the internship of all courses at DELTA institution they are adequate within the number of hours, with a workload of 408 hours, the same occurring with the academic-cultural activities with 200 hours.

It is emphasized at DELTA, that the majority of courses has training hours research, being that the Pedagogy course is the one which presents the highest number of hours for this activity: 306 hours. Still, it is worth noting that this institution offers undergraduate courses in the long-distance mode in the areas of Geography, History and Languages and Literature.

This way, the majority of undergraduate courses at DELTA meets with what is recommended by Resolution n° 2/2002 from CNE, even though some courses have not been adapted since hours have not been destined in the curriculum for the development of the professional practices activities.

The exam of the curriculum composition of the undergraduate courses of the EPSILON institution presents the following configuration: all courses have a higher workload than 2800 hours, being that the lowest number hours of 2852 hours in the courses of Philosophy, Geography and Physics. The other courses add up over 3200 hours and Pedagogy is highlighted by the sum of 3702 hours.

The distribution in the areas of training at the EPSILON University presents a variation in the courses. So, the hours destined to the specific knowledge disciplines add up to 1440 hours in the Geography course and 2508 hours in the Chemistry course. Due to this, the Chemistry course is one of the lowest one in the number of hours in the pedagogical disciplines with 238 hours, and the Geography one is of 544 hours. Among the courses with the lowest number of hours to the pedagogical disciplines there are History, Chemistry and Philosophy, being that this last one offers a lower total workload in relation to the others.

Regarding the number of hours destined to the professional practices, the History course only has 68 hours, Music 272 hours, Physics has 160 hours and Chemistry, Physical Education and Philosophy have 136 hours. However, the courses of Pedagogy, Languages and Literature, Geography and Mathematics comply with the resolution's recommendation. In regard to the number of hours destined to the internship, the only one lower than 400 hours is the Geography course; the others have 400h or more, as in Mathematics with 510 hours and Music with 544 hours.

In regard to training for research, only the Languages and Literature course does not contemplate a specific discipline; the other courses include some research discipline, being that Pedagogy has 306 hours. Still, about the academic-cultural activities all the courses include 200 hours or more for these activities.

This way, it is verified that at EPSILON the majority of courses in relation to the curricular organization is adequate to what is defined in Resolution nº 2/2002 of CNE. However, the area of professional practices is the one which presents the biggest deficiency in regard to the recommendation.

In the data collection for this research it was observed that two universities created a general coordination for the undergraduate courses whose role is to articulate discussions and propositions for these courses. In one of the universities, an undergraduate forum is maintained, a space in which the propositions from the various courses are analyzed, searching for a bigger articulation. Indeed, the creation of a general undergraduate coordination, a way found by the institution to reorganize the undergraduate courses considering the new CNE requirements, has favored some advances in the search of theoretical and practical articulation. The agents involved try to minimize the dichotomy between theory and practice existing in this development.

So, in the institutions group, it is highlighted the importance of the disciplines of specific training, with a high workload destined to them, which in some courses it reaches 75% of the workload. This way, even though there has been the inclusion of other training areas and the distribution of the pedagogical training happens along the course, this level of specific training predominance is close to the model 3 + 1.

In the interviews done during the research, it was possible to highlight some points which complement the undergraduate courses curricula analysis. They are the following:

- The main change happened in the distribution of the workload of the undergraduate courses expanding the disciplines for professional practice and internship with an increase to 800 hours. This resulted in a small decrease in the disciplines of knowledge of the specific areas and the maintenance of the same amount of hours in the disciplines of pedagogical fundaments.

- Another change happened in the organization of the distribution of the disciplines during the course. The disciplines of pedagogical training happen concomitant to the specific disciplines, during the course since the first semester. However, there is no intentional and programmatic articulation among the disciplines, when the articulation occurs it is isolated and circumstantial.

- The formulation of initiatives in working the relation between theory and practice during the course and inside of each discipline which composes the curriculum and integration of the disciplines of common fundaments to all the undergraduate courses can be considered an innovation.

- Regarding the professional practices proposal, some institutions try to maintain an integration among the disciplines for professional training and the internship, strengthening the practice and theory articulation among the fundament disciplines and the action of the student in the school. Some practices are specifically destined to the teacher's professional training, but some practices are destined to the graduate's professional training.

- The internship done in the schools – maintains the previous form of these practices, which are: the observation, the participation in the classroom together with the classroom teacher and finally teaching in the classroom. These internships happen in public and private schools. None of the universities checked have their own school. The agreements are done between the education departments in the cities and state, however, the school may not accept teacher-trainees. This way, each internship supervisor teacher establishes a partnership with the schools so that their students may perform these activities. The students go to these schools only one day of the week.

- The articulation with the practice from the beginning of the course is done through the Professional Practices disciplines. Indeed, this solution found by the courses coordinators and teachers groups discussed in collegiate and Undergraduation Forums, maintained by the institutions, constitutes an advance in the search of the articulation between theory and practice. However, it maintains the emphasis on the internship from the fifth period and logic of the theory as a practice action guide. This logic, which is in the basis of the scheme 3+1 still prevails in the different institutions, being that the private ones manifest a movement of search to alter it.

- Within the researched public universities, one of them, makes it explicit the maintenance of the scheme 3+ 1. The majority of the coordinators from this institution said that, in order to comply with the resolution, they created practice disciplines and expanded the internship workload in the last two years. The Languages and Literature coordinator points out that the disciplines workload was reduced because of the increase in the amount of hours for the internship. In the speech of one coordinator it is noticed the worry with the theoretical fundaments in the initial years for the later pedagogical training implying in the student's option after two and half years of course.

- In regard to the teacher's training for inclusion, in the Pedagogy courses the disciplines for LIBRAS (*Linguagem Brasileira de Sinais* / Brazilian Sign Language) for communication with hard of hearing students were included. In some institutions, LIBRAS discipline was included in undergraduate courses, besides some complementary lectures.

- Regarding the training for research, teachers have showed concern that in some institutions they offer disciplines for research methodology, although teaching with research is not done. They are initiatives of some professors. Besides this, in some courses the students do a final course paper (TCC).

Final considerations

Upon completing this text, we reiterate that the analyses presented are interim, but denounce the urgency of a policy commitment to teacher training. Decisions at national level although they recognize the need to develop a solid proposal for the undergraduate courses, provide a lightweight training and poor conditions; in the articulation between the teaching systems of higher education and elementary education; and in the support to students with encouragement to incentive them to more dedication to training.

In this perspective, a first aspect that we can perceive is that the private institutions try to meet the determinations of CNE while the public ones, using their autonomy, do not meet them totally. It is observed a movement in the private institutions in the sense of creating spaces for discussion for the agents involved in the courses.

Regarding to the basic education guidelines in Brazil, it is found that the guiding documents define for each one of the teaching modes a specific direction. This way, the guidelines for the various teaching modes besides the national curricula parameters set which include all the basic education. An interlocution between the propositions of these documents and the undergraduate course proposals demand a deeper study than this text covers. However, there is evidence of fragility in the undergraduate course proposals, since the relation with the basic education is more intense only during the internships.

The internships are understood more as a demonstration of what a future teacher is capable of teaching "classes", since in a general way the procedures include to observe teachers' classes in community schools, to plan classes and to be observed in the teaching of these classes. The study of the curriculum of the basic education is not much emphasized as a specific discipline in the courses, the preparation for teaching is focused in the didactic discipline and on the specific didactic disciplines, with little time dedicated to this study. Some courses do not include these disciplines.

Gatti and Barreto (2010) in considerations show that the universities do not assume as priority the teacher's training, and as a result, the course proposals weaken the comprehension of the questions related to the teaching organization, to the education fundaments and maintain the pedagogical disciplines disarticulated from the specific ones and vice-versa. The author calls attention of the propositions related to the internship which are inconsistent without indicating the approach policies and agreement with the schools.

Likewise, Diniz-Pereira and Viana (2010) point out to the current risks of emphasizing the training of teachers as a process of speeding up and improvisation, reinforcing the same problems denounced along the years of estrangement from the basic education and academic disrepute of the teacher's training in the university. Novoa (1992) states that teachers training is influenced by various factors, which should be studied in a way which allows to interfere in a constructive manner in the training of the graduates who in the future will be conducting didactic activities in the classroom. Training that gives to teachers the means of an autonomous thinking besides a participative self training.

It is highlighted that Martins and Romanowski (2010) specifically analyzing the didactic training of teachers in the undergraduate courses proposals find indicators that these courses do not offer the discipline of General Didactics and start to offer the methodologies of specific teaching. This way, the knowledge worked in the course about the teaching process is restricted to the comprehension of one area of knowledge, and not to the process in their totally.

Dias da Silva (2005) in his study about the conflicts triggered starting from the requirements of the undergraduate courses, points out to the fragility of the training role of the educational knowledge and for the deprofessionalization of teachers. He points out central aspects of these Resolutions of *Conselho Nacional de Educação* (CNE- National Education Council), where the implantation in the undergraduate courses "can have result in the negation of the training role which belongs to the Education area, resulting from the trivialization and/or negation of the educational knowledge." In the words of the author "The new legislation impacted the universities" for being a process of imposition of duration and the workload, the compulsory compliance of curricular credits destined to the performance of activities of a "practical" nature, 1000 hours destined to: 400 hours of "practice as a curricular component", 400 hours of "supervised teaching curricular internship", plus 200 hours of "other forms of academic-scientific-cultural activities". Dias da Silva (2005, p. 6) stresses that the "central question became arithmetic: impregnated by legal organizational culture, used to the establishment of minimal curricula for undergraduate courses, allied to the eternal clashes between bachelor's degree and degree course, the immediate result of these resolutions for our universities were

reduced to the allocation of hours in the curriculum, with disastrous consequences for the knowledge construction of future teachers".

The obtained indications in the research in focus in this text point to similar results. Undergraduate courses are in ambiguity with the bachelor's degree; striking conception that a solid theoretical training guarantees a consequent practice. The referrals, with rare exceptions invariably locate the moment of the practice in the final years of the course, preceded by the theoretical training; inconsistency in the internship propositions, with unavailability of effective guidance to students, the modulation of classes with an excessive number of students; the training proposals rarely include innovations in the articulation with the current basic education demands like inclusion, diversity, violence, which maintain the training centered in the academic domain of the specific knowledge, more articulated with the bachelor's degree; it is still outstanding the conception that a solid theoretical training guarantees a consequent practice. The referrals, with rare exceptions invariably place the practice momentum in the final years of the course, preceded by the theoretical training.

The dissonances accent the devaluation of the teacher training processes in contradiction to the crescent expansion of the education value as a permanent, continuous and universal process, condition to social life and for the development of social groups and of economic life. The challenge goes much beyond of the reformulation of curricular proposals!

281 - The Teacher Training Literacy: Approaches, Processes and Practices

Simone Regina Manosso Cartaxo and Pura Lucia Oliver Martins

Strictu Sensu Graduate Program in Education of the Catholic University of Parana- Curitiba-Brazil
simonemcartaxo@hotmail.com, pura.oliver@pucpr.br

Abstract: This research aims think over the processes that were outstanding at the continuous formation practice of the teachers at Municipal Teaching Section in Curitiba, Brasil. The method used is the quality approach in the mode study case and it includes placing, recovery, selection, organization and documentary sources analysis at the Public files, University libraries, private files, besides the semi structural interviews. For such investigation, we searched for: Identify how the teachers´ moments of the continuous formation are featured at public schools; Identify which theoretical approach of literacy were part of the continuous formation course of the teachers; Identify which theoretical references have been used at the continuous formation of the Public schools teachers; Analyze the processes of continuous formation that have been constituted at the public schools. The analysis has been accomplished having as a theoretical support Martins (1998), who defends the angle of the theory as expression of the practice and Santos (1992), who discusses the matter of the production and distribution of knowledge. Mortatti (2000), Maciel and Soares (2000), and Soares (2003, 2004) assisted by looking at the literacy most specified matters. The fundament about the continuous formation of the teachers were based on García (1999), Imbernón (2002), Marques (2000), Alarcão (1998) and Veiga (1995, 1998). The study revealed that, since the Municipal Teaching Section in Curitiba was formed, different approaches have been adopted at literacy, based on specified theoretical references, which determined the processes of formation of the teachers. In the analysis of the formation processes, some determining issues have been identified, having their origins in the need of: Institute and systematize a literacy approach, abandoning "the old" and choosing "the new"; Considering or not the practice of the teachers in the process of formation, the perspective of distribution of the knowledge was set mostly when a new teaching approach was imposed on the teachers, depriving them from their practices. For the field of knowledge production, moments are set showing that the processes of formation are based on teachers´ practicing and they are inserted in a co-authorship process. However, these movements are not unaware by the teachers, since they have already shown responses by building their inquiry.

Keywords: Teacher education, processes and practices of formation, production and distribution of knowledge.

THE THEORETICAL INTERLOCUTIONS

In this research, Martins (1998) and Santos (1992) provided the subsidies to make the reading of the background and analyze the moments which set up the teachers' training.

Martins (1998) defines experienced historic moments in Brazilian education which served to organize the data collected in this research. There are three key moments - which are part of a whole - from the outlined teaching practice developed by teachers, the theoretical refletion analysis as well as theses and dissertations on teaching.

The first moment is the *political dimension of the pedagogical act* and covers the period from 1985-1988, marked by social movements in Brazil occurred in the late 1970s and the first half of the 1980s, which constitute a new work organization, repercuting within schools. Teachers complain about the participation of eminently political decisions about their pedagogical work (Martins, 1998).

The second moment concerns the question of *organization of work at school* (1989-1993). Social movements are organized, leading to changes in the various institutions, as well as in the production relations, although in an initial way. Teachers, now union members, actively participate in the assertion movements and try to change the established social relations, develop more collective work. It is characterized as a transition period which enables new forms of organizations arising from new initiatives which circumvent the current norms.

It is the third moment, since 1994, that the emphasis falls on *the education problem as a production process and collective systematization of knowledge*. The student is emphasized as a bearer of a social practice and with self-interest, not being able any longer to be ignored by school. This moment is related to the two previous issues through the interdisciplinary problem (Martins, 1998).

Following on with his studies, Martins (2008, p. 14) presents a fourth moment, in which we would be experiencing, characterized by an emphasis on *learning: "learning to learn"*, whose central issue is that students *learn to learn* specific skills established as *competences,* previously defined in learning programs, in line with the demands of the labor market.

Martins (1996, p.85) further explains about the content-form referred to progressive proposals regarding education. According to the author, they are twofold: a concept that views the practice as a result of theory dominion, being the "*theory of practice guide*", and another concept which defends the idea that theory expresses the subjects practical action, meaning the "*theory as an expression of practice"*.

The first concept is based on the Marxist vertent, called *historical materialism*, which is a "conception of history in which the scientific rational has the party as holder of knowledge concerning the *historical mission* of the working classes and transmits it, showing which way it should be followed" [author's emphasis] (Martins, 1996, p. 86). From this standpoint it is considered that a solid theoretical background is a guarantee of a consequent practice.

The second concept is based on the Marxist vertent which "sees the social transformation as a process historically built in and through the struggles of workers " (Martins, 1996, p. 87). In the struggle of classes, there are the practice contradictions and, in this sense, the theory will express the practical action of the subjects and breaking with the idea that theory guides practice.

With this look, what we see is that in the processes and practices of teacher education, the processes of knowledge production are often disregarded, favoring the drive shaft – content assimilation. As a result, it ignores that the teachers have a knowledge about their own existential situation, which was generated in everyday social practice and follows their interests and practical needs.

This analysis initially comes from the defense made by Santos (1984) on the issue of production and distribution of knowledge. The author defends the idea that the school has placed itself in the field of distribution of systematized knowledge, contributing to maintaining the current division of labor and ignoring thus the crux of the problem.

He questions the logic of the organization of systematic knowledge, their parameters, their goals and believes that this "*knowledge consists of products of human practices within the social relations of a concrete social formation and responds to practical human needs*" (Santos, 1984, p . 5).

About this, Santos (1992) explains that a group takes over a specific knowledge, organizes and distributes it, nor taking into consideration the group that receives it can also produce knowledge.

> The structural basic field of these ideologies is the field of distribution of goods. It is this field defining its ideological elements. In it is structured their ideological systems. They all focus on one common element: the unequal distribution of goods and, with respect to education, the distribution of systematic knowledge. Consequently, the analyses of these educators tend to be restricted to cases of the transmission processes of systematic knowledge. They will concern themselves primarily with one point: reformulating methods, and assuming that, from the effectiveness of these methods, are able to achieve an equal distribution of 'educational goods' (Santos, 1992, p. 26).

According to Santos (2004), school, and therefore the student is within a conditioning framework where social institutions are structured, and their existence, form of organization and roles are determined by social relations in the mode of capitalist production.

To explain his theory, the author points out that the relationship between the economic processes and educational processes are not linear and should be understood considering the dynamics of different patterns of capital accumulation as well as the transformations that capitalism is undergoing, and thus the worker's training is inserted into the capitalist system.

By taking an epistemological model in which theory is conceived as an expression of practice and the problems of the concept of borgeous economic theory as an expression of capitalist practice in the field of movement, it is assumed the commitment to guide the teaching practice from which the subjects possess the knowledge they have, how it was produced, its practices and needs.

THE METHODOLOGICAL JOURNEY

The study was based on a qualitative research approach, case study method which according to Andre (2005, p. 16) it is not a specific method of research, but a particular form of study. It also says that the case study is not a "methodological choice, but a choice of the object to be studied" (Andre, 2005, p. 16). He also explains that the knowledge produced from a case study is different from other reseach because it is more concrete,

contextualized, focused on the interpretation of the reader and based on reference populations determined by the reader.

Triviños (2007) still defines the case study as a research category whose object is a *unit* that is analysed deeply, which characteristics are given mainly by two factors - the nature and the scope of the unit - as well as the theoretical framework which serves as a guideline to the researcher.

Based on these ideas is that RME in Curitiba was chosen as object to be studied, with its characteristics and particularities.

The definition of instruments for the research was based on the possibilities of doing an analysis of the object of study in its entirety. Therefore, we chose to do a document research of primary sources and through semi-structured interviews as a way to better investigate the data collected in the documents.

The collection of documents for this analysis was varied. Among the documents collected in schools, municipal archives and private papers belonging to teachers, are: newspapers produced by the Municipal Education Secretary (SME), the RME curriculum proposals; listings, reports and course planning, textbooks, personal writing with course records.

The "conversation" provided with the documents was done in order to be able to ask the appropriate questions to elicit responses which could really contribute to research.

For the interviews, the teachers selected were who met certain criteria. The first criterion specified that the teacher should belong to the RME's own framework of teaching. The second criterion specified that the teacher should have participated in SME activities, in a direct or indirect way for the development of literacy courses offered to teachers. And as the third criterion, at least one teacher would be selected to represent each of the periods defined during the development of the research.

The organization of the data was done in periods whose definition was given from the ideas set out by Martins (1998): the political dimension of the pedagogical act; the practice issues; the organization of work at school; the problem of teaching burdening on the production process and the collective systemization of knowledge; the view of the student as an individual carrier of a social practice and with its own interests; and the intensification of learning in order to "learn to learn ", in which specific skills and competencies are defined as previously defined learning programs.

Five periods were defined, arranged in decades. This organization serves a didactic role which helped organize the ideas and does not intend, thereby, to define historical periods. The delimitation of compelling ideas for every moment does not take away the possibility of finding them in another, because it is considered that the time of production of ideas follows a self movement and it is not still.
Considering, then, the above explanation, it was defined as follows:

  a) *the 1960's* (1963-1969);
  b) *the 1970's* (1971-1979);
  c) *the 1980's* (1980-1989, subdivided in 1980-1985 and 1986-1989);
  d) *the 1990's* (1990-2000);
  e) *the 2000's* (2001-2008, the present in question).

The first period starts in 1963, the year the first public school is built and teachers' training activities within the school itself begin. They are private initiatives to meet immediate needs.

The second period covers the 1970s, when there is a standardization of teacher education through training courses in literacy methods.

The characterization of the 1960s and 1970s took place primarily having as reference the interviews and private documents, since it was not found in the municipal archives the records of the courses concerning these years. The periods which follow had as their main source the municipal archive documents with the crossing of the data obtained in interviews and also documents present in schools.

The third period is the 1980s divided into two main blocks: 1980-1985, which corresponds to the continuity of the processes established in the previous decade but begins to manage a movement for change, and 1986-1989, which corresponds to the change process itself, arising from the national post-dictatorship movement. That's when it identifies the political dimension of the pedagogical act, teachers demanding more space for participation and the approach to literacy begins to receive influences from linguistics and from the writing psychogenesis studies.

The fourth period covers the entire 1990s, when emphasis is placed on working with literacy resized by the linguistics studies. The moment is focused on the organization of work in school, looking back to the practice issues and to the problem of education which lies with the process of production and collective systemization of knowledge, and the student starts to be seen as an individual carrier of a social practice and with self-interests.

And the fifth period, which addresses the current situation (2001-2008), with a systematization of the courses up to 2005 and the interviews. Marked by the early absence of a new approach to literacy, but which ends with elements that characterize the intensification of learning in order to "learn to learn", in which specific skills are defined as previously defined skills in learning programs. To literacy, it is set up a more focused approach to phonological awareness agregated to previous approach.

ANALYSIS OF PROCESSES AND TRAINING PRACTICES

In the 1960's and 1970's it is possible to identify that the focus is on literacy techniques training based on different methods and proposals that were being worked with teachers: *Caminho Suave*, *Método Misto*, *Erasmus Pilotto*, conditioned and repeated speech. It is recurring the use of the terminology "techniques training" for the courses offered, regardless of whether they referred to literacy or not.

This approach refers to the tecnicist pedagogical conception arising from the education reform by Law No. 5692/71. It has as main element the rational organization of means with the operationalization of objectives, the mechanization of the process and the division of the pedagogical work in order to seek efficiency by minimizing subjective interference. The standardization of teaching takes place through a plan formulated in advance, which determines to the teacher and to the student when and how to do it.

In this view, the role of the school becomes "the training programs repeater", as Veiga (1995, p. 21) examines it. At this point, no space is given for the school to take over the management of their processes and do not value the knowledge that teachers have of their pedagogical practice.

For Braggio (1992), the methods used in literacy classes bring a conception about the nature of the language isolated from the "totality of the linguistic phenomenon and disconnected from a socio-cultural-historical context which gives its origin" (pp. 7-8). Its acquisition is based on a vision of man as a being isolated from society, passive and uncritical, unable to "experience the internal contradictions of changing himself and the society which surrounds him through its *praxis*". Society is conceived as static, homogenous and devoid of antagonistic values and of class struggle.

Thus, it can be assumed to focus discussion on the best teaching method for literacy is the same as homogeneous classes training to facilitate the teaching process disregarding other determining factors.

In search of a solution for the high failure rates, the RME Department of Education has imposed the implementation of Eurico Back's proposal in public schools. This implantation was followed closely by administrators from the school network. By the way, teacher Liza says:

> And city hall has forced schools to use it. So the people who were in the Department of Social Welfare[82] were on a Saturday at school and we had to sign a term commitment, of responsibility, assuming the results that the school would have for not using this method [...]. It was our luck, because it was too complicated. First we had a great meeting to pass something that absolutely nobody had heard until then; second it was an imposition; third no one asked anyone what we thought about it. It was a method that did not work, I think with two, three years or even less, it finished. No one ever spoke about it again. We had stacks because city hall, even without we using it, sent all the material (LIZA).

Another attempt to specifically address the issue of literacy was done. The work of Professor Erasmo Pilotto[83] was already known by some people of the state and city school network and presented a methodology for literacy. The teacher had already made an experience, around 1950, and had had good results. The proposal signaled a rapid methodology because, as was recalled by teacher Liza, he always said: "*We do not have much time to teach writing, we have to be fast.*"

In the 1980s, in addition to the training courses focused until then, it is possible to see some movement in the proposals that address the broader issues. The words "training" and "techniques" begin to take less space and now words such as "seminar", "meeting", "study group" are used – although in literacy this movement begins to be felt only in 1984, when there is the first reference to "reflection", and in 1985, with "new alternatives" and "meeting".

---

[82] The first initiatives of City Hall in the educational context date from the 1950s. In 1955 was created the Education and Culture Section, which was part of the Department of Education, Culture and Tourism. In 1965 was created the Department of Social Welfare, and the Board of Education now started to have sections in accordance with the new units that were being created. The City Department of Education was created later.

[83] Professor Erasmo Pilotto contributed for the education in Parana through his work as a professor, writer and Secretary of Education and Culture.

With regard to teacher training courses, it is also shown those who describe themselves as "newalternatives to literacy", whose content focuses on the student's knowledge and the pedagogy of Freinet, with the same principle. It is considered that the resulting ideas were being managed with the new local and national configuration.

In the period 1986-1989 the focus of the national context on approaches related to literacy begins to undergo a change. Proof of this is the abandonment of an approach based on literacy methods and the search for new alternatives for the pedagogical work. The national context is marked by an intense social participation, and the courses considered as a background have as a guiding axis the discussion on the historical-critical pedagogy. This discussion is also based on the literacy approach.

It is in this context of openness, of collective participation of the popular people that there is a significant change in the content of the courses offered to teachers starting in 1986. Teacher Liza justified:

> *Because we, around 78/79 back in school, we were discussing a lot this issue of child reading, of the child understanding, of the child being able to express him/herself. Then the mixed method was no longer coming. Erasmo Pilotto was no longer coming. We were searching other materials, reading other materials, then what we had in the early 1980s was already another level of production, it was another type of work. You were starting to have a Cagliari[84], which you heard talking from time to time [...]* (LIZA).

The change occurred in the course content it is being managed during the previous years and starts to show its face only now. The political context which was being experienced, according to Martins (1988, p. 62), happens inside schools and teachers complain of participating, featuring an eminently political moment.

The background discussions brought in its base the historical-critical concept. This concept has become focused in the areas of knowledge and literacy. For the reorganization of the pedagogical work in schools, teachers claim for more study time. It is during this period that is is created the teachers' statute. On this, teacher Liza says:

> *Joined with the statute, joined with the assurance that the statute gave that city hall was responsible in offering at least an annual course for the teachers. Then came the Pedagogical Studies Week, which was the City Seminar on Literacy. There was a moment that the issues of literacy in fact began to be discussed, shared, socialized in the network. It was beginning to have this discussion in Brazil* (LIZA).

In the early 1990s, it was configured what Martins (1998, p. 62) pointed as a strong mark of the moment, the collective work organizations, where the teacher asks for room for discussions. Consequences of this are the courses which deal with the theme "Basic Curriculum"[85] and the "pedagogical doing" conducted within the schools themselves, with each one working according to their specificities.

In the general context, the central discussion themes are the courses which address the pedagogical doing, the organization of the pedagogical work and of the Basic Curriculum, and the courses designed to literacy are present within these broader themes.

Cycles of learning implanted in 1999 at RME sought to bring a reorganization of the pedagogical work, transforming the serial school organization into learning cycles.

Another aspect to be analyzed during this period, notably in the 1990s, was the question of practice. Martins (1998, p. 35) characterizes this scenario whose eyes turn to practice issues as the new watchwords. About this, teacher Elen says:

> *In the 1990s the city government changes and with it changes one way of seeing this. It started to be said the following: it is worth more who has the practice than who has the theory, and we who were in possessiom of the theory end up not even knowing how to say..., we were on the sidelines of this process, because a new group arrives at the Department and brings with them people who were in the classroom. The practice, to them, was who was working there on the floor, and then what happens, we thought and they performed. There was this moment of who thought and who performed [...]* (Elen).

---

[84] The teacher refers to Luiz Carlos Cagliari, master and doctor in Linguistics and author of many papers in the area of literacy, besides being professor at *Unicamp*.

[85] The Basic Curriculum was done in the 1980s and represents the first guiding production of the knowledge areas of the basic education.

The teacher also explains that this positioning - the practice as a watchword - it was intentionally defined by the Department of Education.

> *That was verbally placed, by the departament head, was the policy of bringing people who had the practice. Today it is clear that these people who had the practice, had already appropriated the theoretical issues, could already review what they did and of course also advanced, but at that moment it happened that way* (Elen).

When the studies about linguistics arrive, the writing psicogenesis and the RME Basic Curriculum, breaks up with the literacy approach focused on the methods.
It is during this period that the pedagogical practices begin to give voice and opportunity to the student. It is tried from the students knowledge to develop the work in the classroom. Research developed on writing psychogenesis follow in this direction, on how the student learns to read and write. About this look for the subject, the teacher says:

> *Yes, if you get before the 1980s, you will get just that, then when it appears, when it starts the entire discussion that the issue is not how to teach, but that behind that there is a subject who learns, and that when he/she arrives at school already has a way that he/she traveled and what he/she thinks about this object is the light of the work of Ferreiro* (Elen).

SME concentrates efforts to convince the teacher that they should work in another way. Well, this conviction was the result of theoretical discussions and when it comes to practice, many problems begin to happen. The children ended the year without knowing how to read or write. The older teachers, despite what the Secretariat proposed, they continued to do this as they knew, and the younger, who participated in the training courses of SME, they worked only with the new approach to literacy. The "old teachers" had the specific student's material to show to the "Secretariat", the didactic guidance as determined by them, but they also had exercises that they themselves drew up, the so-called "slush fund", and believed that it worked. On this, teacher Liza tells:

> *They became the guardians, the keepers of time. The teacher who was longer there, he/she was the slush fund, so he/she had the material for the Secretariat and he/she had the slush fund. The new teacher did not know about the slush fund. It was then that there was a collapse of the work on the first grade, at the time, because there is a moment that it downed on us, because the child would come out of 1st grade without knowing how to write, without knowing what was the purpose of the letters* (Liza).

In the 2000s, resulting from global capitalism, the municipality starts to manage the computing processes in the network and to articulate ways of achieving ecological actions, since it carries the designation of Ecological Capital and the issue is widely discussed in the global context. A product of that is the investment devoted to training teachers between the years 2001 and 2004 in these two sectors in detriment of working with other areas of knowledge.
During this period it is noticed a movement that also emphasizes the ways students learn and the specific skills are defined as competencies and they are previously defined in the learning programs.

> *In the guidelines we have evaluation criteria for the cycle. So, it has been a long time that teachers have asked that we say exactly what the child has to learn during the year. So, there were the general cycle criteria and the school was organized according to what was selected and that would be worked in each year* (Alice).

Already the *learning to make* focused on the productive subject as characterized by Martins (2008) is found in the teacher idealized by Ana, where she explains what is necessary for the teacher:

> *This entire staff has brought a conceptual discussion about evaluation, and now we need two other things: the procedural teaching and teaching attitude. We need teachers who know what to do, when, how, besides why. [...]* (Ana).

INTENTIONS OF THE CONTINUING TRAINING COURSES

In 1988, we lived at RME a time marked by an intense collective movement and many ideas were being developed. The construction of the Basic Curriculum brought as a mark a critical-historical philosophical concept and, in a parallel way, an approach to literacy marked by "conceptual revolution", which broke with methods that were being disseminated in the form of training workshops.

The need to establish a new philosophical concept generates a collective movement, calling teachers to be coauthors of the process. As for the approach to literacy, it is necessary to create situations of "re-form" the teacher to know, understand and then be able to apply the new knowledge originated from the conceptual revolution. These needs have to be addressed by offering continuing training courses.

It is seen, then, in 1988, the duplication of course offerings. In the five previous years, the amount does not exceed 94 courses per year: in 1987, 77 courses were offered; in 1988, the total jumps to 154. The focus of the courses are the contents and methodologies from different fields of knowledge.

In 1992, teachers start to have in their hands an extended and reformulated curriculum. A new team is formed at SME, with the permanence of some from the previous group. The reorganization of the curriculum is justified, in the words of the director of the Department of Education, for the need to comply

> [...] with the indicators given in the monitoring in the work of the schools; with the advising which showed the difficulties and needs by the teachers; with the valuable contribution by the local consultants and from other parts of the country; with the aid and cooperation from various sectors of the SME, particularly from many education professionals from our school; [the team from SME] who prepared this edition – which registers the progress made up to now (Curitiba, 1991, p. 12).

By bringing new material into the hands of teachers, it is necessary to work with the ideas present in them. It is understood, then, that in 1992 there is a quantitative leap in offering courses. During 1991, there are 124 courses offered, and in 1992, the offer goes up to 277.

In examining the titles of the courses, it is identified a focus on the curriculum. In order to illustrate, there are titles as: *SME Basic Curriculum; The Basic Curriculum under discussion; Curriculum proposal 92 - study and analysis; Basic Curriculum, a new education proposal; Basic Curriculum: reflexion for a new practice; Basic Curriculum: a new perspective on teaching.*

In 1995, an even bigger jump is observed: there are 310 courses offered, being that in the previous year there were 137. One explanation for this is made by teacher Elen:

> In the 1980s the issue was more about quality, because it was discussed theoretical, basic, fundamental issues [...]. In the1990s the municipal government changes and with it changes one way of seeing this, it started to be said the following: it is worth more who has practice than who has theory [...]. Then the learning and teaching laboratory appears, and by then it is already 1990, and in this learning and teaching lab the people who were in the classroom working with the student began working with the teacher, and then the training courses appear by the quantity, by the pounds [...] (Elen).

The comparison done by the teacher about the 1990s in relation to the previous decade indicates the change of the municipal government and the overlap of practice related to the theory as factors which determine the need for new courses. The approach to literacy, with a greater focus on linguistics, occurs in terms of theory as a guide to practice.

Teacher Liza says that during the 1990s, working with 1st grade was compromised due to literacy data referrals:

> It was then that there was a work collapse in 1st grade at the time, because we have a moment where you realise that the child would come out of 1st grade without knowing to read, write, without knowing what letters are for. Was it general? No, it was not general, but it was the majority, the result was very complicated and it was a process which lasted a long time [...] (Liza).

The problem identified by teacher Liza is serious: the children were not learning to read and write, they did not know what the letters were for. You could not teach syllabication to children, it was forbidden. The guidance given was towards the work from the text.

Then, the need to show practice on how to teach children literacy skills from the text became the motto. And so the courses take place "*by the quantity, by the pounds ...*".

In 2007/2008, the intent of the courses offered to teachers, in the words of Alice, is:

> *To work with phonics and the textual approach. Both the text macrostructures and the textual microstructures so that literacy really become effective. It is subsidizing the teacher so that he/she has the practical and theoretical part... Then we work within this need, of the teacher understanding that he/she needs to use both approaches to teach literacy. There are some rescue issues, of things that were left out [...]* (Alice).

The continuing training courses conducted in the RME points to the need to subsidize the teacher in his practice as a literacy teacher. However, it emphasizes the idea of using these training areas for the consolidation of a new literacy concept that, at times, become impositions.

FINAL CONSIDERATIONS

The conclusions concerning the processes and training practices of the literacy teachers are based on a question concerning the formation of areas of training, which can be constituted as spaces of *production* or of *distribution* of knowledge. By constituting themselves as *production spaces*, it is considered that the knowledge that teachers bring from their practice serve as a starting point for reflection and they walk towards *theory as practice expression*. On the other side, the *distribution spaces* of knowledge are characterized by the formation of a group which appropriates knowledge, organizes and distributes it regardless that the group which receives can also produce knowledge, thus, they walk towards the *theory as a practice guide*. From this viewpoint, we noticed a movement between the production field and knowledge distribution in the various periods discussed in the research. The perspective of knowledge distribution is mainly imposed when a new approach to literacy was imposed on teachers, ignoring the knowledge which they bring to their practices. For the field of knowledge production, moments are marked where training processes start from a teachers' practice and these are inserted in a process of co-authorship. However, these movements have not gone unnoticed by teachers, since they showed reactions when making some inquiries.

In moments when it was instituted the imposition of a new approach to literacy, there was also a reaction by teachers seeking to ensure their practice, and clashes were fought by requiring a positioning. Such conflicts are characterized by the need to make a choice: "either this or that".

To make reading of what has been done so far, it is the thought of Alarcão (1998) ideas that reinforce the need to see the teacher as producer of knowledge. She said:

> Teacher's knowledge is not merely academic, rational, made of facts, notions and theory, nor is either a knowledge made only of experience [...]. It is a knowing act in a situation [...], refusing outright the idea that the teacher is a mere technical bureaucrat, a yes man from the system and from the government, a mere executor of directives issued from above[...] (Alarcão, 1998, pp. 104-105).

Marques (2000) points vocational training as a challenge, as it must be based on other requirements, considering that professional practices are the training space. "If before the theory could be built in anticipation of future practices, the practices now anticipate the theory, require to be better understood to be better exercised" (Marques, 2000, p. 206).

The continuing education can happen in different ways: specialization courses, workshops, educational meetings, seminars, congresses; however, regardless of form, it is clear that teacher training takes place largely by stripping himher of his/her knowledge.

Therefore, it is considered that in the processes of teachers' continuing education it is essential to have them as coauthors in the process of knowledge production, considering their practices and taking as the central axis *the theory as expression of the practice.*

288 - Teacher Development Through Iterative Processes – Learning Study and Design-based Research

Mona Holmqvist[1] & Clas Olander[2]

University of Gothenburg, Sweden
[1]mona.holmqvist@gu.se, [2] clas.olander@gu.se

Abstract: Research on teachers' professional development usually aims to support meaningful and sustainable shifts in practice, which Butler, Novak Lauscher, Jarvis-Selinger & Beckingham (2004) claim require analytical theories on learning. Such shifts can be made by the use of models such as the iterative process developed by Butler et.al. (2004). The model includes concrete activities and access to mentors during a period of two years. Even more, the professional development usually aims to have some kind of impact on pupil outcomes. In a study on the impact of school leadership on pupil outcomes, one of the found perceived challenges is to "personalize the learning experience of the students" (Day, Sammons, Hopkins, Harris, Leithwood, Gu, Brown, Ahtaridou & Kington, 2009, p. 193). In our research we have focused on teachers' professional development in relation to the pupils learning outcomes (Holmqvist, 2010; Olander, 2010) using different models to achieve sustainable shifts in practice. In this paper we present the result from four of our studies in which we have used different models; learning study and designed-based research. Both are a kind of action research and the teachers are co-researchers in the iterative processes. The studied objects are formulated by the teachers in both models. However, a learning study relays on a theoretical framework and aims to capture what it takes to learn a specified phenomenon (Holmqvist, Gustavsson & Wernberg, 2007). By that, a learning study do not focus on the design of the lesson, it rather focuses on the content and in what way the features of the content are varied to make the pupils discern all needed parts. In the learning studies presented in this paper variation theory is used as a theoretical framework (Holmqvist, Gustavsson & Wernberg, 2008). One aspect which differentiates learning study from design-based research is the latter's focus on developing a theory that characterizes the design. Further on, the focus is more on the design of the lessons (methods and instruction) than the features of the content. However, both of them make improvements both on teachers' professional development and the pupils' outcomes. The results of the learning studies show how the teachers' understanding of how to use contrasts when presenting the object of learning resulted in significant better learning outcomes (Holmqvist, 2010). In the reported design-based research study (Olander, 2009) the experimental group had a significant better outcome than the national sample concerning if they are in line with science theories. Comparing three answers in a science test, 43% of the answers in the experimental group were in line with the theoretical explanations, but only 9% of the national sample had three answers in line with the theoretical explanations. In the paper we discuss the results in relation to the different models to explain what features seem to be of importance to teachers' professional development in relation to pupils' learning outcomes

Keywords: Action Research, Learning/lesson Study, Design-based Research, Literacy

INTRODUCTION

Research on teachers' professional development usually aims to support meaningful and sustainable shifts in practice, which Butler, Novak Lauscher, Jarvis-Selinger & Beckingham (2004) claim require analytical theories on learning. Such shifts can be made by the use of models such as the iterative process developed by Butler et al. (2004). This model includes concrete activities and access to mentors during a period of two years. Even more, the professional development usually aims to have some kind of impact on pupil outcomes. In a study on the impact of school leadership on pupil outcomes, one of the found perceived challenges is to "personalize the learning experience of the students" (Day, Sammons, Hopkins, Harris, Leithwood, Gu, Brown, Ahtaridou & Kington, 2009, p. 193).

In our studies we have focused on teachers' professional development in relation to the pupils´ learning outcomes (Holmqvist, in press; Olander, 2009) using different models to achieve sustainable shifts in practice. In this paper we present the result from four of our studies in which we have used different models; learning study (3) and designed-based research (1). Both are a kind of action research and the teachers are co-researchers in the iterative processes. The studied objects are formulated by the teachers in both models and aims to capture what it takes to learn a specified phenomenon (Holmqvist, Gustavsson & Wernberg,

2007). However, a learning study relays on a theoretical framework about learning. By that, a learning study do not focus on the design of the lesson, it rather focuses on what it takes to "learn the content and in what way the features of the content are varied to make the pupils discern all needed parts. By that the design of the instruction is subordinated.In the learning studies presented in this paper variation theory is used as a theoretical framework (Holmqvist, Gustavsson & Wernberg, 2008). One aspect which differentiates learning study from design-based research is the latter's focus on developing a theory that characterizes the design. Further on, the focus is more on the design of teaching strategies that communicate the critical features of the content (Mortimer & Scott, 2003). However, both of them make improvements both on teachers' professional development and the pupils' outcomes, but it is not only the iterative process or the teachers' knowledge that makes the pupils learn more.

The results of the three learning studies show how the teachers' understanding of how to use contrasts when presenting the object of learning resulted in significant better learning outcomes by the pupils (Holmqvist, in press). In the reported design-based research study (Olander, 2009) the experimental group had a significant better outcome than the national sample concerning if they are in line with scientific theories. Comparing three answers in a science test, 43% of the answers in the experimental group were in line with the scientific explanations, but only 9% of the national sample had three answers in line with the scientific explanations. Our main question in this paper is - in what way can the teachers' and pupils' developed knowledge be related to the iterative processes used in the two different models? And as we can see differences in the groups of pupils – what features of the iterative process seem to be of importance? Our hypothesis is that it takes more than an iterative process to make those changes, but the iterative process might be an important tool to use when searching for features needed to develop teachers learning.

THEORETICAL FRAMEWORKS

Action research

Coulter (2002) claims education and action in fact get little attention in educational action research. Instead there is a strong focus on the relation between theory and practice. However, there is no clear connection between good practice and application on theory. Coulter (a.a.) means it takes more than theoretical knowledge and experience to create good practice. Knowing what to do might make the teachers talk in a much initiated way about their practice, but this do not mean there necessarily has been any changes in it.

> Deciding what counts as good practice – understood as *praxis* – involves more than the application of theory or the exercise of skill. Determining what is the right thing to do in the right way at the right time – and actually doing it – involves a particular kind of judgment: *phronesis,* a term variously translated into English as 'prudence' (Betner, 1983), 'practical wisdom' (Reeve,1992) and 'practical judgment´(Steinberger, 1993).[…] Teachers with *phronesis* must not only know what to do: they must do it. (Coulter, 2002, p 191)

Analyzing results from an educational action research project should be based on other data than interviews, observations and field-notes only, to capture what kind of changes actually occurred. Otherwise the teachers' way to talk about their changes or development in practice, the participants' enthusiasm noted by the observers and the expectations all have on what they will achieve might guide the results in a much more positive direction than what is reasonable. Even if the teachers have both theoretical knowledge and are experienced, it does not mean they are able to use their abilities in a way that develops practice. Herr and Andersson (2005) present different kinds of approach in action research, and in this study we take our departure in what is called technical action research, as we use empirical data to describe our results. We have a strong interest to make the implicit features in practice explicit to develop practice. This means we do not only base analyzes on data from the participating actors expressed statements of changes or developments. In fact, we have in studies noticed how the teachers misjudge learning situation as more developing by contrasting their expressed assessments of learning with data where the pupils' knowledge is documented (Ljung-Djärf & Magnusson, submitted). Our departure is that a reliable result about developed educational practice should include more than personally expressed feedback from the participators, as the main aim is to develop learning.

Design-Based Research as an iterative framework

Design-based research is an approach within a larger family of *design research* (Plomp & Nieven, 2010), and design-based research is characterized by Sandoval and Bell (2004) as a "theoretically framed empirical

research based on particular designs for instruction" (p. 199-200). The Design-Based Research Collective (2003) propose a methodology where the design of learning environments and theory development (from ´prototheories´) are intertwined. The working process is iterative; using continuous cycles of design, instruction, analysis and re-design. Furthermore, the work has to include active participation of practitioners, the designs have to be assessed in authentic practice and "also focus on interactions that refine our understanding of the learning issues involved" (The Design-Based Research Collective, 2003, p. 5). The study presented in this paper basically followed the methodology of *design and validation of topic-oriented teaching-learning sequences* (Andersson, Bach, Hagman, Olander & Wallin, 2005) where researchers and teachers collaborate in an effort of making science learning more sustainable. In this approach an area of school science is chosen, preferably one that is considered problematic in relation to students´ long term retention, for example optics, state of matter or evolution. In a design phase (see Figure 1) the teachers and researchers scrutinize what it takes to learn the chosen topic, which is an exploration that considers nine aspects of which one is connected to the scientific side of the chosen topic, the character or the core scientific aspects of the topic. The reasons for teaching the topic are considered along with a selection of relevant content for the actual group of students. The students and the teachers current ideas (starting points) are investigated along with an analysis of local circumstances and the actual curricula and syllabuses. Furthermore is a review of research literature in science education made in order to find examples of current teaching practice and already performed interventions; in this respect the database from Reinders Duit (2009) especially helpful. The work in the design phase leads to a suggestion of goals for the sequence along with a tentative teaching sequence of approximately six to ten lessons. This sequence is enacted by the teachers in their own classrooms (meaning that the tentative sequence is adjusted to e.g. the age of the students and other local circumstances). The sequences are documented in various ways, for example by log books, tests, video recordings, and this documentation forms the basis in the next step which is an evaluation that leads to a re-design which is enacted, documented, evaluated etc.
Figure 1: Working process

Learning Study as another iterative framework
Learning study (Holmqvist, in press) is a theoretical based lesson study (Lewis, xxxx; Toschida, xxxx) where cycles are used to develop knowledge about what it takes to learn in different subject matters. The model is flexible and should be adapted to the object of learning, which means it can consist of one single lesson per group or several lessons per group. However, the cyclic process is important as the results of one lesson are used to further improve the lesson design to develop an increased learning outcome. In the studies we discuss in this paper variation theory (Marton & Booth, 1997; Holmqvist, Gustavsson & Wernberg, 2007) is used as the theoretical framework. The model used consists of an iterative process where the design of the first lesson is based on the results of the screening and the studies in subject didactics. The second lesson is revised based on the learning outcome, i.e. the assessed knowledge in the pre-test compared with the assessed knowledge in the post-test. By that we can describe what seem to have been possible to understand and what still seems to be hard to gain knowledge about. This will be repeated one more time, which means the Learning Study Cycle consists of three research lessons, as shown in figure 1 below. The iterative process gives the teachers possibilities to gain knowledge about both the students' learning, learning about the subject and learning about instruction. The process also includes video-observations where the teachers study both their and colleagues' teaching and the interaction in the classroom. However, the main aim is to study how the object of learning is handled in a classroom situation and what the students' seem to discern of it. Learning study is a theory-based model, and the theory used so far is variation theory (Marton & Booth, 1997; Holmqvist, Gustavsson & Wernberg, 2008). Variation theory is based on the assumptions that discernment, simultaneity and variation are all required in a learning situation. You have to discern the phenomenon you are supposed to learn about, and the discernment is possible because of simultaneously

awareness of varying aspects. When you decide if a person is tall or short requires the simultaneously awareness of varying lengths, if everyone was exactly the same size length would not be discerned.

Figure 1: The learning study cycle.

The theoretical framework is used to design the instruction, and the teachers are introduced to the theory during the learning study cycle. This means their knowledge about the theoretical framework hopefully develops during the process and results in a gained knowledge after each cycle.

METHODS AND PROCEDURES

Design-based studies
The project group consisted of two researchers, four teachers, their 180 students (in grade 5 – 9) and the working process (see figure 2) took place during one school year.

May/Aug/Sep/Oct	Nov/Dec	January	Feb/March	May/June
Design meetings	Teaching 1	Evaluation 1/ new design	Teaching 2	Evaluation 2

Figure 2: Working process during the two cycles

The topic we chose was biological evolution, partly due the rich literature in science education on students difficulties to appropriate the topic in a scientific way (cf. Bishop & Anderson, 1990; Kampourakis & Zogza, 2009). We started with four design meetings where we explored the nine aspects (see previous section) ending up in a teaching goal focussing the use of a scientific theory as a *tool* (Mortimer & Scott, 2003). This was formulated as: the students should be able to explain the evolution of life on earth using the meaning of the terms heredity, variation and selection. Our ´prototheory´ in relation to teaching strategy was informed by research that, of very few, show positive effects in students learning; specifically literature on students use of language (cf. Lemke, 1990), the use of peer group discussions (Jimenez-Aleixandre, 1992) and dialectic argumentation (Asterhan & Schwarz, 2007).

Learning studies
English as second language is the subject in the three learning studies reported in this paper. Three different objects of learning have been studied; (a) possessive pronouns, the infinite verbs (b) to be and (c) to have. One learning study was implemented per semester (Learning Study A, B and C), for a total of three semesters, which means that three different learning objects were focused upon. In this study, three micro-cycles form a macro-learning study cycle (Learning Study A includes lessons A1, A2 and A3). The participants in the study were six teachers, their pupils and researchers. The teachers were included in a team at a school for pupils aged 10-12 years. The numbers of participating pupils in the first learning study were 54 (23 boys and 31 girls) in school year 5. During study two 64 pupils were included (29 boys and 35 girls) in school year 4. In study three 48 pupils participated (26 boys and 22 girls) in school year 4. Each cycle starts with 3-5 meetings to discuss the theoretical framework (variation theory) and define the object of

learning. Each learning study started with a screening, which means the students' previous knowledge is analyzed. Based on these results the tests and design of the first instruction is planned. By that the lesson is jointly designed. Before the lesson the students' take a pre-test, and after the lesson they take a post-test. This makes it possible to measure the development between the two assessments. The items in the test are designed to capture if the students' have discerned the needed critical aspects (what it takes to learn the phenomenon) to understand the object of learning. The result is used to design the second lesson, which is implemented in a new group of students. This iterative process is repeated one more time (in total three lessons per learning study). The lesson is video-documented by two cameras.

Measurements and analysis

Design-based studies
Analysis in the study was conducted in two ways; on the one hand a macro analysis and on the other hand a microanalysis. The macro analysis is more concerned with learning outcomes (the product of learning) estimated with a pre- and post test design generating quantitative data pointing towards generalization as knowledge claim. The micro analysis is more concerned with the learning process estimated as language analysis of student interactions in peer groups generating qualitative data pointing towards situative knowledge claims.

In order to validate the intervention in relation to students´ learning outcome a pre- and post test design (Olander, 2009) was used. The pre-test was given a few days before the instruction started and the post test approximately three months after the teaching ended. Some of the questions where the same in both tests and served as tool when estimating whether the students had changed their way of answering; an indication of gained sustainable knowledge (at least three months). This paper will especially focus three questions given in the delayed post-test because they serve as a kind of control. The study did not make use of control groups in the sense that a comparable group where given "ordinary" teaching. This relies partly on our doubts whether educational research can use the standard idea of control groups (for example another group in the actual school) perhaps there are to many invariants that biases the idea? On the other hand educational research should be prepared to make knowledge claims that are possible to generalise. The study presented in this paper made use of a previous national assessment in Biology for compulsory school (National Agency of Education, 2004) as a kind of control. This assessment was performed by the Swedish National Agency and given to a random sample of Swedish ninth graders (fifteen year old). In the assessment there were three questions (out of twelve) about biological evolution and these three were given to the experimental group in their delayed post. Both groups, the national sample and the experimental group, answered the questions under similar circumstances, for example as unprepared individual writing assignments and the students answers were assessed by the same standards in both groups.

The analysis of students talk in peer group discussions (Olander & Ingerman, 2010) was performed in order to get an indication about the ways the intended teaching strategy (see ´prototheory´ in previous section) was enacted in the classroom and appropriated by the students. The analysis of students talk was guided by an idea from the work of Vygotsky (1986) concerning the tension between the *meaning* and *sense* of a word or utterance. Vygotsky made a distinction between the stable zone (*meaning*)of a word, i.e. the zone that points towards the generalised, collective and lexical meaning of a word; while *sense* is more situated and dependent on the context of the talk, thus pointing to the local, personal, and creative zone. In the present study teachers and researchers (in the first design phase) decided that the scientific story should be communicated with the key terms: heredity, variation and selection. These terms are close to what Vygotsky define as meaning. i.e. lexical, generalised and collective interpretation. The analysis of students talk focussed the ways the students made use of these terms, i.e. the sense of the terms (the personal and situative zone).

Learning studies
All lessons were video-recorded and transcribed verbatim. The analysis of the instruction was made after each lesson and compared with the results of the tests taken by the pupils (pre-test, post-test and delayed post-test). This process was repeated three times in each cycle as there are three lessons per learning study. Finally, all the three learning study cycles (including three lessons each; n=9) were analysed and compared with each other, as well as the discussions during the meetings with teachers and researchers.

RESULTS

Design-based studies

Two types of validation and comparison (χ^2 -method with p<0,01) of students learning outcome was performed, internal and external validation. The internal validation made a comparison within the intervention, between students answers before and after the intervention. The students in the experimental groups significantly (p<0,01) improve their way of answering from pre-test to delayed post-test, and this was the case irrespective of the age of the students (for a more thorough description see Olander, 2009). The external validation made use of a control consisting of a random sample selected and assessed by the Swedish National Agency (2004). This assessment was done in grade 9 and therefore our comparison is more thoroughly done in relation to the 83 students in the experimental group that were in grade 9 (see table 1).

Table 1. Consistency among three answers in grade 9 (p<0,01)		
	No answer in line with theory of evolution	One or two in line with theory of evolution	Three answers in line with theory of evolution
National sample (n = 620)	59 %	32 %	9 %
Experimental group (n = 83)	16 %	41 %	43 %

Nearly 60 % of the students in the national sample do not give any answer (out of three) in line with the theory of evolution which points at the fact that the topic is problematic to appropriate for Swedish students. In that light it is interesting that more than 40 % of the students in the experimental group was able to answer all three questions in line with the theory of evolution.

The intention from the teachers were, as earlier mentioned, to communicate the scientific story of the evolution of life on earth with certain key terms as tools: heredity, variation and selection. An often occurring teaching strategy was to let the students discuss and explain phenomena related to evolution. The pupose was that the students should make use of the introduced key terms – but the students hardly ever used the terms in verbatim. Instead they made recontextualisations and our analysis (Olander & Ingerman, 2010) turned to these recontextualisations. The theoretical underpinning relies on the assumption that the key terms reflect the meaning of the words and the students recontextualisations reflect the sense of the words (Vygotsky, 1986). It turned out that the students made use of paralleling, transferring and delimiting strategies. In summary: the key term variation was recontextualised as ´difference´ or ´dissimilarity´ (paralleling); heredity was expressed as ´lives on´/ carried on´ (transferring); and selection was mostly referred to as ´survival´ (delimiting). All these recontextualisations have their merits and drawbacks in relation to the meaning of the key terms, but they all informed the teachers actions, for example, they often used the expression ´difference´ instead of variation (and it turned out to be equally good). The teachers were also able to start a conversation about whether ´lived on´ or "survival capture all the nuances that heredity and selection signify – this is an example of teachers employing formative assessment.

Learning studies

The focus in this paper is not mainly on the students' results, it is the effect of the iterative process which is highlighted. However, it seems as the cyclic process develop the teachers' abilities to design instruction in a way which makes the students' understand the object of learning in a better way during the cycles. By discussing and analyzing both the lessons and the students' learning outcome with colleagues and researchers the teachers seem to gain knowledge about what it takes to learn. In the three learning studies reported here a pattern of variation in contrasts was used. The more able the teachers seem to be to handle contrasts to make the students learn, the more increased knowledge. In Holmqvist (in press), the outcome of the learning studies have been analysed and described as in figure 2. The results show how the experimental group showed increased knowledge over time when exposed to the design where the contrast pattern was used. Even if this is not an explicit finding which supports the hypothesis that iterative processes gain

knowledge about how to design instruction - which in turn gives increased student learning outcomes – the results points at more developing learning situations.
Figure 2: Differences in learning outcome in short (pre-post) and long term (post-delayed post) and between control and experimental groups.

DISCUSSION

With the four exemplified studies we have shown that the students who participate in the interventions significantly improve their ways of answering written questions concerning the taught topic; the object of learning. The four studies have certain features in common, for example the working process is iterative, conducted in authentic practice and recognize the contribution of the teachers both in planning, enactment an evaluation of the interventions. Furthermore, the aim in these studies is to make conclusions not only grounded on statements from teachers, but also on test results from students and from in-depth analysis of design meetings and classroom interactions. In our view this opens several ´black boxes´, for example teachers´ planning (intended), interactions during instruction (enacted) and students´ learning outcome (lived). We claim that our approaches enhance the possibilities to make conclusions about important features of teacher development. Our studies indicate that an iterative process in collaboration with teachers assessed in authentic practice has an impact on teacher development.

However, we would like to point on some issues that are not equally focused in learning study respectively design-based research; mainly the issue of ´content´ versus the ´language´ that the content is communicated in the classroom. The primary aim of a learning study is to explore how the object of learning is handled through the lens of variation theory (discernment, simultaneity and variation); meaning that the content is primarily focussed (and then language). In the design-based approach described in this paper the primary aim is to investigate in what ways the scientific theory works as tool in the students sense-making process; meaning that language is primarily focussed (and then content).

Abstract: This study seeks to understand the importance and significance of Veredas Project for teachers' participants from perception and reflection of them on their teaching practice. This field research was conducted with five teachers that Project participants engaged in the teaching profession in the State schools of the city of Viçosa – Minas Gerais; two teachers' tutors and a teacher teaching Coordinator of the Instructor Agency (AFOR) of Federal University of Viçosa, through a roadmap of semi-structured interviews and backed in documentary analysis. We emphasize participants did and still do an exercise of reflection on its formation and its practice in the classroom, given the proposed for the course, the development in the practice of triad action-reflection-action. The course made this process of reflection of participants about their own practice and, moreover, can be seen that they continue their studies seeking specialization courses.

Keywords: Training of teachers, Veredas Project, teaching practice, reflective teacher.

INTRODUCTION

This study's[86] inserted into the debate about teacher training, discusses how object study training and pedagogical practice of teachers under the Veredas Project – Higher Education of Teachers (Veredas Project, shorthand).

The context of research was the first Veredas Project version deployed by the State Government, State Department of Education of Minas Gerais (SEE-MG), sponsored by international bodies, including the World Bank (BIRD) . Started in February 2002, completed in July 2005, the course was intended to enable and qualify at a higher level 15.000 (fifteen thousand) teachers of early elementary (called teachers participants or just participants). Were effective partnerships with eighteen higher education institutions (IES) mining, public and private, called Agency Instructor (AFOR) realized training and certification of participants. The in all, AFORs professional tutors were 851 which took the teaching-learning activities of participants of Veredas Project throughout the State.

Specifically, what if you wanted was to discuss the formation of teachers under the Veredas Project, identifying the perception of the teachers' course participants about the influences of this course in its pedagogical practice during the course and those five years after its termination. Sought to verify participation in a course of initial formation in service specifically in Veredas Project, meant and still means in reflections on the teaching of the teachers course participants, through discourse analysis of five teachers participants, a teaching Coordinator and two teachers belonging to the Instructor Agency of Federal University of Viçosa (AFOR-UFV).

SCENARIO THE VEREDAS PROJECT IN INSTRUCTOR AGENCY OF FEDERAL UNIVERSITY OF VIÇOSA

To understand the reasons that surround the goals and the entire Veredas Project planning is important to contextualize the scenario of education in Brazil from the Law of guidelines and Bases of education – LDB-law n ° 9394, established on December 20, 1996 (Brazil, 1996). The LDB in his Art. 62, indicates how minimal training required for the exercise of the teaching in the elementary grades, higher level training in undergraduate degree course full. Aware that many teachers-in-Office in the public schools of the country hasn't had superior training, Art. 87 of the law adopts provisions concerning the training of teachers in exercise, using features of distance education as a means to meet the training of teachers.

---

[86] Funded by FAPEMIG - Foundation for Research Support of Minas Gerais.

The Veredas project incorporated the guidelines modernization for teacher training – in service and the distance – and the necessary political and ethical dimension to intellectual formation of new type, according to the ideas, ideals and hegemonic practices. Understanding the function of the school is to train the human being, which implies "work, in addition to cognitive development, aspects of affectivity, citizenship training, ethics, sexuality, anyway, all dimensions of human beings" (Minas Gerais, 2002a, p. 74), the teacher's training may not be just "technical and academic", although these aspects are indispensable. The new type intellectual, required to deal with all matters in which the school is involved, assumes the "cultural transformation that in turn implies lobby interior of the need to change the pedagogical process" (Minas Gerais, 2002a, p. 75).

To articulate the theory and pedagogical practice, we practice as a central element of the course. The emphasis on the centrality of practice is to situate educational action figure of the teacher and the classroom. Despite the bill states that the importance of theory cannot be diminished, it's a knowledge built on experience, i.e., contextual knowledge and returned to practice in the classroom.

The teacher who acts in the grades of elementary school is expected as features the ability to be familiar with the curriculum content, plan and develop teaching-learning situations, stimulating situations in which your students can interact socially with tranquility, which administer the situations in the classroom that respects the cultural diversity of the students and learn to deal with them. With these features the teacher "appreciates knowing that produces in their daily work, shall own improvement and is aware of his dignity as a person and as a professional". State Secretary of Minas Gerais (Minas Gerais, 2002b, p. 3).

Within the proposed Veredas, the professional who seeks to form is the one that seeks dialogue theory and practice, a teacher who not only teaches the contents, but it reflects on them, taking as reference its experience in the classroom and the social context in which it is inserted.

In this context the professor makes a personal investment in your training process itself, through the work critical-reflexive about their praxis and rebuilding your personal identity, resulting in customer experience knowledge.

In the perspective adopted by the Veredas Project, as a pedagogical proposal, the teacher prepared to act in the early grades of elementary school is characterized as a professional search tools necessary for competent performance of his duties and has the ability to question their own practice, critically thinking about it.

To implement a superior training course, teachers were provided five integrated systems to ensure its execution in all its organizational levels. They are:

Instructional System - responsible for the operationalization of the curriculum - defining areas, disciplines and workload, seeking to ensure the use of instructional materials. Sets the curriculum. As for the curriculum Veredas it was organized into three main sections: Core Content Elementary School, Center for Knowledge and Pedagogical Center for Integration.

Operating System - responsible for the arrangements for carrying out activities - general screenings (candidates, AFOR, tutors, materials) planning and coordination of activities (classroom and collective).

Tutoring System - which provides support for educational activities (individual, distance driven and pedagogical practices), planning and implementation of recovery activities for learning, development of support materials to participants, planning and monitoring of tutors.

System Monitoring and Performance Assessment - responsible for evaluating the program, check its quality and the learning of the course participants - collecting data: processes of implementation, expected outcomes and impacts on teaching practice, and the development of assessment tools.

Communication and Information System - responsible for contacts and information flows - organizes reception centers and Portal Veredas on the Internet. It is this core of computer science AFOR that will provide access to the Internet, with information relating to the course, to mentoring, to news, the curriculum, agendas and records of assessments. Computing and audiovisual media, along with guides, will help bridge the gap between teachers and students.

The Pedagogical Veredas in the AFOR/UFV - covers the poles 8 and 11[87] - specifies that the Project will last for 3,200 hours and will be developed in seven modules of 457 hours, covering a range of activities. The

[87] The poles 8 and 11 of AFOR, respectively comprise the following cities: : 1- Abre Campo, 2- Acaiaca, 3-Alvinópolis, 4- Amparo da Serra, 5- Araponga, 6- Barra Longa, 7- Cajurí, 8- Canaã, 9- Diogo de Vasconcelos, 10- Dom Silvério, 11- Guaraciaba, 12- Itabirito, 13- Jequeri, 14- Mariana, 15- Oratórios, 16- Ouro Preto, 17- Pedra Bonita, 18- Pedra do Anta, 19- Piedade de Ponte Nova, 20- Ponte Nova, 21- Porto Firme, 22- Raul Soares, 23- Rio Casca, 25- Santa Cruz do Escalvado, 26- Santo Antônio do Grama, 27- São Miguel do Anta, 28- São Pedro dos Ferros, 29- Sem Peixe, 30- Sericita, 31-Teixeiras 32- Urucânia, 33- Vermelho Novo, 34- Viçosa. 1- Alto Caparaó, 2- Alto Jequitibá, 3- Antônio Prado de Minas, 4- Barão de Monte Alto, 5- Caiana, 6- Caparaó, 7- Caputira, 8- Carangola, 9- Chalé, 10- Conceição de Ipanema, 11- Divino, 12- Durande, 13- Espera Feliz, 14- Eugenópolis, 15- Faria Lemos, 16- Fervedouro, 17- Lajinha, 18- Laranjal, 19- Luisburgo, 20- Manhuaçu, 21- Manhumirim, 22- Martins Soares, 23- Matipó, 24- Miradouro, 25- Miraí, 26- Muriaé, 27- Mutum, 28- Orizânia, 29- Palma, 30- Patrocínio do Muriaé, 31- Pedra Dourada, 32- Reduto,

interaction strategies are developed through individual and collective activities, some in person and others from a distance.

One such strategy is to Face Intensive Phase. In these meetings, which occur at the beginning of each module, the AFOR, present themselves to the course participants' contents and activities for the period, developing work plans and participating in the activities Contemporary Culture. In this phase the teacher students have to stay a week in AFOR, participating in various activities like lectures, social gatherings, cultural activities, and to prove every six months.

THE CONCEPT OF REFLECTIVE TEACHER IN VEREDAS PROJECT

The material produced by the Veredas Project for the training of teachers was based on the concept of reflective teacher as a reference, especially as authors Nóvoa, Perrenoud, Schön.

Besides Nóvoa, Perrenoud, Schön, other authors also address this theme, such as Alarcão, Bolivar, Contreras, Girox, Pepper and Zeichner, among others, there is no unanimity in relation to that concept, and in some respects their opinions converge, in others they diverge.

In the discussion of these authors, the training of teachers has shifted from an approach focused more on the academics for a professional ground-centric perspective (Nóvoa, 1992). And that shift brings with it the need to understand how this professional thinking, his actions and his actions from their training and their daily practice.

This is how some authors highlight the emphasis on the concept of reflective teachers in different countries, mainly from the movement of teacher development that marked the years especially in 1990 (Pimenta & Chedin, 2005).

The leading proponent and pioneer of this concept, the American teacher Donald Schön that through study and observation, he realized that the professional degree from a curriculum that offers the first science, then its implementation and, finally, the application of that knowledge technical professional, is not able to respond to the demands that arise in daily work, because they go beyond the knowledge produced by science and the technical answers that could have not yet formulated (Pimenta & Chedin, 2005, p.19).

This perspective is that Schön (1992) propose a training based on the epistemology of practice, i.e., "the enhancement of professional practice as a moment of constructing knowledge through reflection, analysis and questioning of, and recognition of tacit knowledge, this the solutions that the professionals are in action " (Pimenta & Chedin, 2005, p.19).

Perrenoud (1993) highlights the need to train teachers reflexive:

> "The professional mobilizes a capital of knowledge, know-how and be not stalled, on the contrary, grows constantly accompanied the experience and reflection on experience" (Perrenoud, 1993, p. 186).

From the postulate of Perrenoud can think that a reflective teacher is one who develops his practice taking a posture analysis and problematization permanently in action that plays, mobilizing for both, the knowledge acquired in your training as well as those generated in their practical experience.

Understanding the teacher as a reflective practitioner, the context becomes fundamental to your training process. Continuing training that advocates the professional workspace, in the case, the school becomes a privileged environment because it allows the explicitation demands stemming from this context, where teachers can put themselves forward needs and dilemmas of teaching. View by this prism training continued advances in terms of initial and continuing training, where the school context-space and activity of teacher- become privileged spaces for fostering such training.

The Veredas Project, whose was to feature in-service training, allowed the teachers dialogue between content studied and the issues experienced in daily practice, this process has pervaded the teaching proposal of the Project, whose aim was the enhancement of practice reflected. Broadening their field of training leading to their ability to cast a look of strangeness about their work and, in an exercise of reflection, analyzing it critically.

The reflective teacher must be one that performs a reflective analysis of practice underpinned by a solid theoretical and ethical and committed involvement with and in the context that builds knowledge, from the idea that all knowledge is the result of the search and the subject's action on your surroundings.

Think of the teacher as reflective professional is to say that the issues of teaching job but are practical questions that require "a natural treatment insofar as they are strongly determined by situational

characteristics, context and the history of the class as a social group" (Gómez, 1992, p. 102). Therefore, it is understood that the activity of professor finds herself immersed in a dynamic context, plural which is not restricted to the classroom, but covers a wider field that involves the school, community, society where his work is housed.

The classroom, however, is the special area of its action, where it acts directly on most of the time of their work. Second Gómez (1992) the teacher is a researcher of classroom insofar as it reflects on and about your action in a reflective dynamics.

> (...) away from instrumental rationality, the teacher does not depend on the techniques, rules, and revenue derived from an external, or theory of curricular requirements imposed from outside by the administration or by pre-established schema in school textbook. By knowing the structure of the discipline in which it works and to reflect on the peculiar ecosystem of classroom, the teacher is not confined to deliberate on the means, separating them from the definition of the problem and desirable goals before, constructs a theory appropriate to the unique situation of your scenario and prepare a strategy for appropriate action (Gómez, 1992, p. 106).

The ability of the teacher reflects on his action leads to re-scheduling a new knowledge, a new strategy of operation from the challenge that presents itself. This does not mean, however, that he develops actions "improvised", but from a reflection that allows you to mobilize their tacit, confront them with the new knowledge acquired and the reality in which you are located. Therefore, the importance of considering the experience and practice of teachers in their training process. Not an empty practice, decontextualized, rather, a reflective practice.

The proposed Veredas Project perceives the teacher as a reflective practitioner, able to think about their practice and, through studies coupled with their acquired experience, re-laboring new knowledge, new knowledge-dos, and new practices.

According to the pedagogical proposal of the Veredas Project, the teacher of lower grades of elementary school needs to develop itself as a "professional thinker" (Minas Gerais, 2002, p.14). For both the teacher should understand education in its different dimensions are also capable of producing pedagogical knowledge, putting in their own practice critically related to the students, community and society.

PEDAGOGICAL PRACTICE TEACHERS PARTICIPANTS THE VEREDAS PROJECT

When we draft theory and pedagogical practice, we practice as central element of the course. The emphasis on the centrality of the educative action practice ranks in figure of the teacher and the classroom. Even though the project stated that the importance of theory cannot be lowered, it is a knowledge built on experience, i.e. a contextualized knowledge and focused on classroom practice.

The teacher who acts in the grades of elementary school is expected as features the ability to be familiar with the curriculum content, plan and develop teaching-learning situations, stimulating situations in which your students can interact socially, that administer calmly situations in the classroom that respects the cultural diversity of the students and learn to deal with them. With these features the teacher "appreciates knowing that produces in their daily work, shall own improvement and is aware of his dignity as a person and as a professional" (Minas Gerais, 2002b, p. 3).

Accordingly, Tardiff and Lessard (2005) argue that it is important to the association between the knowledge transmitted by top-level institutions related to teacher training and experiential knowledge of these professionals in exercise, i.e. knowledge based on daily work, and on knowledge of their environment. For him, "the pedagogy is the set of means employed by the teacher to achieve their goals within the framework of educational interactions with students" (Tardiff & Lessard, 2005, p. 117). The author explains that the pedagogy is seen by teachers as a technology used in the course of their work.

Inside the reflections on the formation of teachers in its size paradigm, realizes a sharp inclination, in actuality, progressive educational trends. According to Silva (2006), these trends are based on the principle of critical analysis of social realities within the capitalist mode of production that values the sociopolitical bias of education. Giroux (1990), as cited in Pimenta and Ghedin (2005) saw the need to train teachers who are critical, and reflective. Teachers must be able to analyze the school contexts more comprehensively. In this case, the reflection would be a path to transformation of social inequalities, assuming thus an emancipating role. Cunha (1989) agreed with the above-mentioned reflection above by stating that:

> "The practice of teachers in the classroom is consistent with the mode of production that happens today in our society, i.e. the Division of labour and knowledge. The analysis of this reality is more an

effort to help the teachers and students to reflective exercise. And only the reflection can give us the consciousness needed to change "(Cunha, 1989, p. 151).

Teacher training and constant updating are guided in pedagogical paradigm of action-reflection-action (Schön, 1983, as cited in Tardiff & Lessard, 2005). Your decisions and actions, therefore, must be focused on analyzing and solving problems identified in both the social conditions of its exercise teaching, as in case of seizure and active ownership of students, making the practice of teacher is reasoned reflection object.

How do teacher, their actions, and their attitudes are closely related to their beliefs, their training, their life experience. Is a whole article. Therefore, it is believed that, in proposing the formation of a reflective teacher, wished himself also a new design for teaching action that extrapolates unilateral limits transmission of knowledge: the teacher teach and we learn from previously established techniques and static. Inside the Veredas Project training proposal goes beyond this assumption admitting a professional more "complete", able to think and reflect on their actions, intra and extra-school.

In the project's pedagogical proposal Veredas, the condition of teacher-in-office would give the teacher participant the "opportunity to articulate their practical and theoretical knowledge developed in the Study Guides, solving everyday problems and raising new issues for the theoretical discussion" (Minas Gerais, 2002, p. 36). In walks the idea was that teacher participant could go reflecting on his training and his performance at the same time, where theory and practice are constantly articulated.

Teacher training proposed by Veredas, has a prospect of forming a reflective teacher, his practice comes as key point in the process of training. This perspective knowledge on the teacher's professional practice must have, among other grounds, reflection on practice. And this reflection must be made on sharing with other teachers, the exchange of experiences, look on the action itself as a teacher, talking with the theories, methods and standards of their field. Is the conjunction of all these elements that is what you're doing teaching, its pedagogical practice.

The Veredas Project has enabled new learning experiences and challenges, and, above all, a conception of teacher training focused on the practical perspective of rationality, in which the reflective professional so idiosyncratic constructs its own professional knowledge, encouraging the teacher the development of new pedagogical knowledge.

The training is built through the work of critical reflection on the practice, and the reconstruction of a personal identity. According Dominicé (1990):

"Giving back to experience the place it deserves in learning the knowledge needed for life (personal, social and professional) passes by the finding that the subject actively constructs their knowledge throughout their life course. No one is content to get to know, as if he were brought from the outside that holds its secrets formal. The notion of experience mobilizes an interactive and dialogical pedagogy". (Dominicé, 1990, p. 149-150).

Permeating the idiosyncratic dimension, many authors realize weight exercised by personal experiences to guide teaching practice. Second Tardiff and Lessard (2005, p. 46):

Today, one of the trends of research on the teaching consists of favouring malleable or fluid aspects of craft, sometimes to the detriment of coded or formalized aspects. Teaching begins as a work heavily contextualized, concrete, positioned (Schön, 1983), marked primarily by situational contingencies. Teach becomes improvisation, more or less regulated (Perrenoud, 1996; Tochon, 1993) somewhat resembles the "free jazz" and based on intuition (Van Manen, 1990), or even on the idiosyncrasies of each teacher (Elbaz, 1983). The teaching is then designed as a "craft" means a learned art intact, held mainly groping, and partially by reactions reflected in emergency contexts. The cognitive foundations of this work, i.e. the set of knowledge, skills and abilities necessary to comply therewith diary, assume here quite experimental coloration, personal experience, until the previous story, family or school (Butt et al., 1988; Carter and Doyle, 1996). Affection also assumes a prominent place here because it is based on the strong affective experiences (relationships with students, positive or difficult experiences, etc.). that the "self-training" of the teacher (Abraham, 1984) is built and updates itself.

The role of the teacher is constructed and interpreted on a daily basis. It is in accordance with the interpretation of the goals that educators will guide your practice with a view to the teaching-learning process (Tardiff & Lessard, 2005).

Tardiff and Lessard (2005) have also to be teaching is to have, overall, an emotional work. According to him, professor transposes into practice all that he is as a person. To be aware that the human knowledge is an object of a teaching job, there is no way to maintain objectivity in this relationship, since teachers are also loaded of subjectivity, characteristic of humans.

It becomes necessary to resume the fact that teaching is influenced both by external agents, as well as internal elements to teaching itself. However, understand the teaching is not only analyzing the simple sum of these elements. The sum of external and internal to the teacher generates a resulting hybrid of sharp idiosyncratic dimension (Tardiff & Lessard, 2005, p. 211) stated that:

> [...] teachers do not apply nor follow mechanically the school curricula; Instead, separate them and turn them into appropriate situational who find their previous experiences as well as many other conditions, such as your understanding of the matter, his interpretation of students ' needs, available resources, the progress of the class, your preferences and values, etc.

The Veredas project's pedagogical proposal is in the perspective of forming a reflective teacher who assume responsibility for their own professional development and participate as protagonist in the implementation of educational policies. Thus, while it aims to train professionals within a vision of professor, wants to contribute to improve their professional practice and to improve the quality of public school, in a continuous process of action/reflection/action (Braúna & Ferenc, 2008).

According to Pimenta (2005), when it proposes to teacher training reflective, believes that this practice enhances not only the teacher as a person in the exercise of their profession, but also from school.

The allowance of Morin's thought on education is where everything connects to everything; in learning to learn is that the teacher models your action that results in a pedagogical practice transformative, because "this way, the human being, through education, will be able to rework his thinking and reflecting consciously" (Petraglia, 2003, p. 77).

Society press changes in teaching-learning process that make it possible to put the teacher and the student in conjunction with the content so that they are able to acquire, through practice questioning their own viewpoints and build your knowledge.

Teacher's practice must be reasoned reflection object. Your decisions and actions must be targeted to consequential analysis and for resolving problems identified in both the social conditions of its exercise teaching, as in case of seizure and active ownership of students.

The teacher thought permeates their attitudes and knowledge built into your own learning process. Such knowledge, well organized, reveal the characteristics faculty he prints in their work. Make sure, in this situation constant professional growth, aspects of clarity and objectivity in developing content and domain broad theoretical-practice in substantiating this implicit knowledge.

CONCLUSION

The Veredas Project arose after applying the LDB 1996 in a context of educational reform. It is based on pedagogical paradigm or paradigm of rationality practice, in this paradigm will arise the importance of teacher reflective image, an image that will try to work the possibility of professor make your reflection on their pedagogical practice from its knowledge, with the theoretical knowledge of course, having as main axis reframing of teacher professional identity. This paradigm came somehow counteract the paradigm of technical rationality and make a speech about the pedagogical and practical experience; considering knowledge constituted by persons, their baggage of knowledge on pedagogical practice lived.

In examining the contents of the depositions taken from the interviews with the participants teachers of Veredas Project one can see that there were changes in posture, in ideas and in practice of those teachers. We believe that this process of reflection and practice was stimulated by the training course. A reflective teacher expression, reflective practice, reflection on practice was recurring themes throughout the project's pedagogical proposal and was present in writing all the educational material. The triad action-reflection-action was often crafted in modules. The teachers were reflecting and building such reflections over three and a half years of the course.

We realized through the words of participant teachers they have developed a new perspective on your teaching practice. They are more questioning about his practice, about its role as educator, they have developed a habit of thinking more about their own practice and that has not been lost over the years after the completion of the course, on the contrary, they continued alone seeking new knowledge, challenges, wanting to grow as a person and as a professional. We believe that these teachers, because live in a university city

offering many opportunities for graduate courses contributed to achieving these teachers continue their academic education.

The knowledge and the training process through participatory acquired and seem to endow these teachers course, a critical sense more pointed, offering them useful intellectual tools for understanding and interpreting more complex situations in which an intellectual link between knowledge and reality walks towards enabling the emancipation of those persons and not just instrumentalize them technically to "pass" content.

The Veredas Project has provided the teachers to rethink and reflect on their own pedagogical practices. This involves rethinking your actions in the classroom, their professional attitude, their own school.

During the analysis of the interviews of the teachers course participants realize that they have an exercise of reflection on his training in the course and its practice in the classroom. Such musings seem to cater to that proposed by progress on bringing teachers participants to make the linkage action-reflection-action.

According to data analyzed, reflexive action on teaching proved to be a frequent element in speeches of the teachers interviewed who experienced the Veredas Project and those five years after completion of the same, many of them remain in the pursuit of ongoing formation through courses of specialization.

291 - The Importance of Training Didactic-Pedagogical in Postgraduation Courses

Rita Márcia Andrade Vaz de Mello[1], Leililene Antunes Soares[2], Michella Vaz Pedrosa[2], and Maria das Graças Soares Floresta[1]

Department of Education, Federal University of Viçosa, Minas Gerais, Brazil
[1] rmello@ufv.br, floresta@ufv.br
[2] leililene@yahoo.com.br, michelha.pedrosa@ufv.br

Abstract: This study aimed to explicit the dimensions of the formation teachers of higher education held at the Stricto Sensu graduate studies (Masters) in special, how occurs the pedagogical training. The methodology was based on an exploratory study that provided subsidies to reflect on the processes of teacher training of 128 students enrolled in the course Teaching Higher Education, regularly offered in the Federal Institutions of Higher Education of Minas Gerais. The results pointed the postgraduate as pledge of greater employment opportunities, and the titration highly valued in different social segments, especially in academia. The objective to better exercise professional function and the desire to specialize in that area were the choices that stood out, occupying respectively the first and second place in the classification of graduate students. The needs identified in this study provide for the urgent implementation of the VI National Plan of Graduate Studies (PNPG 2011/2020), considering the locus of teacher researchers and professionals who work at different levels of education, especially higher education. This new plan should propose ways for the Graduate Programs include in their courses, alternative ways to cover the issue of teacher training, suggesting the introduction of the Didactic of Higher Education as part of the curriculum of graduate school.

Keywords: Didactics of higher education, teacher training, pedagogical practice, Post-graduation Stricto Sensu.

INTRODUCTION

Working with the training of teachers soon faced with the dilemmas which mainly since the early 1980s, come across the field of Didactics as to the nature of their object of study, its contents and, particularly, its role in teacher training.

Recent issues, such as the National Performance Review of Students, whose goal is to assess the income of students of undergraduate courses in relation to the syllabus, their skills and competencies, bring the scenario of discussion one of the oldest problems as well; which is the formation of the teacher, not only regards the moment in which it occurs, but also by the processes used, the ways to evaluate it and to what extent the training of the teacher is relevant factor in the quality of teaching, student's professionalization and development of the University's social commitment with the society.

Generally understood to teacher training as a condition for a good transfer of knowledge. When we question relations between policies, curricula and practices, developed in universities by teachers, students and administrative personnel, as well as considering the Brazilian University intensifies its forms Strategic Board on the three pillars: education, research and extension, to standards of excellence and competition on the market, one might ask: will teacher training take place in post-graduate Stricto Sensu and occupy only pedagogical issues in the classroom? Or should the role of teacher training not include the professional practice of Lecturer, both in teaching and administrative fields, research and extension? We believe that all these fields are spaces of teacher training, both in postgraduate courses and in professional practice in higher education institutions. We know that the formation of the lecturer occurs mainly in graduate programs, Stricto Sensu, and that these are privileged spaces research such training, as a result, this is the basic premise being worked on this study. How is the training of teachers in Postgraduate Courses? There are general education represented by the scientific content and pedagogical training is included in the curricula of graduate school? Is there emphasis on post-graduate courses for teaching? These are some of the issues we can learn in our study.

Sought to clarify the dimensions of the formation of the teaching staff of higher education held at postgraduate level Stricto Sensu, and in particular, as pedagogical training. So, tried to unveiling the

formation process of Master students and Doctorate students, who will be future teachers of higher education, and graduate students who already exercise teaching University.

Our research focuses on postgraduate Stricto Sensu, having as reference the students enrolled in higher education Didactics discipline, which is the only representative of didactic-pedagogical referential curricula. The Federal University Of Viçosa (UFV) and the Federal University Of Minas Gerais (UFMG) were the only federal institutions of higher education (IFES) that regularly offer that discipline, so the constituents of the sample were searched.

We focus on the issues of teacher professionalism, understood as the set of abilities, skills, attitudes and values that constitute the specificity of being a teacher. To constitute a continuous reconstruction process of knowing and doing teachers working implies a continuous flow of movement between vocational training and practice of the profession. In search of seizure of these two dimensions of being unprofessional indissociable from teaching-training and exercise of the profession, we selected as informants for this study students-teachers, actors, multi-faceted, experiencing the process of continuing training in the context of the graduate.

We will also examine in particular the pedagogical training conducted in graduate school, according to teachers' view of the Higher Education Curriculum and course coordinators of the Postgraduate Diploma in Education.

We seek to capture alternatives and reflect on them, trying to understand how the training processes, in particular, continued, can constitute a new praxis and an important instrument for professional development of teachers and reframing of these training opportunities in graduate programs.

We welcome this problem on the evaluation of Didactics of higher education in teacher training, because aside from being very significant identification of characteristics of that formative process, can serve to improve and enrich training programs of university professors. Of course, this task is a challenge, given its complexity, to reflect on teacher training processes in the Stricto Sensu graduate studies in IFES in Minas Gerais.

METHODOLOGY

In this study, the outline of empirical and logical design/construction process of knowledge from an exploratory study descriptive second Triviños (1994), reaching up to the analysis of the meanings of words in questionnaires and interviews, we can offer subsidies to reflect on teacher training processes in the Stricto Sensu graduate studies in Minas Gerais.

In the context of analysis of the universe, we researched focus on training of University lecturer in the postgraduate Stricto Sensu, with reference to students enrolled in higher education Didactics discipline in higher education Institutions Federal of Minas Gerais (IFES/MG).

The exploratory study was conducted in three stages: at the beginning of the first semester and at the end of it, in the discipline Didactics of higher education, through questionnaires applied to graduate in four classes (three UFMG and the UFV) in which this discipline was offered. One year after the completion of this discipline, applying a questionnaire by email addressed to students/teachers, to ascertain the purposes previously and also punctuated, because they are acting as teachers in the classroom.

In addition to the questionnaires, we conducted interviews and study legal documents to meet the work, with enough material for analysis.

We are continuing our investigation, doing interviews with teachers and coordinators of this discipline of post-graduate education, UFMG and UFV.

It should also locate training for university teaching in interconnection with the dynamics of the university and one of the basic components of the policy that guides them, so it's crucial position in the government literature that gestated the post-graduate courses.

RESULTS AND DISCUSSIONS

We understand that this research has attempted to make a rereading of data collected in three moments: in the beginning, the end of the course of Didactics of higher education and one year after being in practice and from there we were unveiling the multiple experiences of graduate students and teachers (Didactics of higher education) in relation to knowledge about education in postgraduate courses. The form, coherence and meaning are built from several search, interactive moments ranging from the way the teacher tried to overcome the challenges of practice and establish relations of content/text to context, providing new pedagogical situations, new methodological issues that could lead students to criticism, reflection, building, Deconstructing concepts and attitudes, rebuilding them.

Although graduate students are currently studying the discipline Didactics of higher education and the data obtained, are aimed at teaching in higher education, the responses of students follow a logic that puts the world of research priority in relation to the world of pedagogical practice.

It is worth noting, however, that a high percentage (85,5%) demonstrates the importance and the goals of graduate to become lecturer.

Analytical disciplines programs in two great proximity; IFES has basically cover the same content.

Observe, by data collected, the search "overvaluation" and please note that the search isn't just one of the largest postgraduate functions, but also a precondition for its social relevance and quality of academic courses, given the benefits of financing linked to activities associated with the research as well as the implementation of instructional resources and improvement of production conditions of research in a context where the number of areas of common interest and partnerships for joint research between science, technology and culture grow quickly. Graduate programs should be seen as essential partners in promoting these integrations and the basis for development of science and technology in the country.

The search process as a whole contributes to the collective reflection on the problems faced by educators, as well as strengthens the need for the teacher as researcher, highlights the very national policy graduate, who has been implementing the emphasis on research priorities and guidelines of the plans, given its strong relationships with the processes of the new world order.

Post-Graduation was considered as the largest pledge job opportunities. It is a general understanding that the titration is very valued in different social segments, in particular in academia.

The goal of exerting better professional roles, and the desire to specialize in the area chosen, were the choices that excelled, occupying, respectively, the first and second place in the ranking of graduate students.

To our questioning to master students and doctorate students, respectively, were some course of specialization (specialization) and master's degrees, if such training was fruitful and why, we got that 39,1% made the course of specialization (specialization) and admit that was fruitful theoretical-scientific training received. To justify this process gains suggest: stimulus to scientific research and the masters; greater safety to teach classes; development of self-awareness and self-esteem, anyway, most training was a differential in the face of other professionals and enabled the work culminating in papers publication, important for the curriculum.

The material gains of that process are shown mainly through the expansion of opportunities on the labor market, in addition to obtaining earned wages and promotion. As regards the intellectual gains, become more efficient in the chosen area; produced new knowledge; improved the quality of teaching activities; increased its contribution to the institution in which they work; started to develop research activities and become more technically efficient in the educational area.

Pre-doctorate students just a thought that wasn't fruitful training at the master's course, but not justified. Others pointed out the gains of this process, namely: personal growth; search for new technologies; training for teaching staff and encouraging research; critical-reflective reasoning, security to support discussions and positions within the area of operation.

If we make a correlation of intellectual and material gains with the four classes searched, we can see clearly that the class where the largest number of masters does not match the greatest material gains and intellectuals as income of such training, in particular in the undergraduate classroom, with the exception of published works, the greater technical efficiency in the chosen area of research and development.

We note that the relationship theory/practice has been object of constant thoughts and research, since part of the permanent analysis of educational issues of our time. The data show that the vast majority believes that the course is mainly theoretical, little suited for practical reasons, however, these same graduate students present contradictions in relation to the affirmative that the theoretical approach of most disciplines offered in course provides solid basis for elucidating the practical problems faced in his professional practice activity, because the results corroborate with what was commented in relation to the previous statement.

We see that among the many items raised both by students and by students/faculty of higher education generally occurs playback system; There is no clarity regarding the goals of the courses, the disciplines; coexist with curricular fragmentation and therefore with a certain isolation from the teacher.

This fragmentation curriculum, disciplinary, leads us to question the University model that separates the teaching of research, also in the process of continuing training in postgraduate courses.

We also point out that the research the problem of academic advising, which is fundamental in postgraduate courses. The lack of time deserves attention, since the data clearly show that most students aren't being properly directed, since their mentors are not being able to serve them properly, when this becomes necessary.

This is undoubtedly a serious flaw in the structure of academic graduate, which affect not only the student, but also the institution Hais delays for the student in completing their studies, and low scores in the evaluation of Coordination de Improvement of Higher Education (CAPES), which, inter alia, takes into account the elapsed time for students to complete their courses.

These questions concerning academic advising, in particular the lack of time for the Advisor must be framed in a broader framework and complex scenario of public universities. Data provided by the subject of research and, more specifically, by lecturers (teachers discipline Didactics of higher education), we can infer that there is lack of funds across all sectors, whether in teaching, research, extension, administration, and a stressful and an individualist to fundraising for the institution. Add to that the early retirements, a permanent staff of credentialed teachers and a permanent staff of teachers new doctors in Graduate Programs, besides the leakage of skilled teachers for private universities, given the scale of pay increasingly outdated in a policy of non-salary increase, utilizing strategy grant bonuses, such as Teaching Stimulus Gratification (GED), reflections today of a policy meritocrática evaluation in a wage policy based on individual and incremental gains.

The goal of creating the GED, established by law No. 9678/98 was to encourage the improvement of teachers ' work in higher education, in order to improve the service offered in public higher education institutions. Please note that currently the GED was extinct and replaced by a fixed bonus.

We highlight that as to graduate in itself, it appears that the same is perceived by learners/teachers in higher education, such as place of teaching and dissemination of knowledge, research, which should give actors it integrated cultural and scientific training, socialization and commitment to help students become subject thinkers, able to construct elements facilitators for understanding and ownership critique of reality.

We emphasize that as the graduate himself, it appears that it is understood by students / teachers in higher education as a place of education and dissemination of knowledge, research, which should provide actors incorporated in a cultural and scientific, socialization and commitment to helping students become thinking subjects capable of building elements for facilitating the understanding and critical appropriation of reality. For learners, is also regarded as Uzhhorod dissemination of knowledge and research, with the function of providing cultural and scientific training, however, is more intrinsic to the world of work with an emphasis on respective areas corresponding to the training they received at graduation and, in particular, in the specific area to which they are currently headed in the post-graduate course.

As to the Didactics of Higher Education, the goal is the search for qualifying and enabling for teaching with pretense of following academic career. It is for them a search space discussion/reflection of educational practice and be paramount in any area and essential for those who work in higher education.

The statements expressed by students and learners/teachers in higher education, covering knowledge, skills and values punctuated as expectations with respect to the Didactics of higher education, we can infer that there is some way to both (students and learners/teachers in higher education), a very sharp featured in relation to knowledge of methods and teaching techniques.

It is visible in the current literature and also by the data obtained in this research, the emphasis on the aspects that occupy the top three positions respectively by sort order, which are: knowledge of teaching methods; knowledge about the relationship teacher/student and knowledge about learning assessment, noting that despite advances in the educational area, these day-to-day aspects of teaching job constitute a focal point in training and in teaching.

We note that, for most graduate discipline Didactics of higher education was beyond expectations, with a broader approach, inserting context historical, cultural, social and political.

Analyzing the discursive set of teachers/specialists, we can infer that, despite the similarity pointed to in designing teaching University, equating it with other levels of education, we realized that teachers themselves always end up reinforcing some gap in higher education and postgraduate courses, either related to students as a way of dealing with the construction and systematization of knowledge and, in particular, the research activity, highlighting so certain peculiarities of teaching in higher education.

As to the meaning of graduate teaching practice, the data suggest a certain similarity between the views of learners/teachers in higher education and teachers/specialists. The lecturer is increasingly aware that the graduate as an instrument of empowerment and improvement is imperative in your professional qualification, as well as the need to research and develop its capacity for reflection and critical evaluation.

It is noted that despite the positive significance of graduate studies for the vocational qualification for teaching, was seconded in accordance with the data obtained with teachers/specialists and also by literature, for Nunes (1999), the "culture of titration" in academia. Therefore, it should be noted that the importance of the titration extrapolates the improvement of qualification and professional practice, including in sphere of appearance meritocrática.

Another factor to be highlighted, which we believe to be of fundamental importance, is that much of the intellectuals involved in teaching have no pedagogical training. So, managers of departments and universities, to seek the quality of the course, should concern itself with this type of training, contributing to the teacher's professional experience in different areas of knowledge, and we believe that the role of disciplinary Didactics of higher education would be an ally in this process.

When evaluating how teaching/learning in higher education the relationship theory/practice in the post-graduate course, noticed that predominated a theoretical academic vision and was seconded that rare are the teachers who are interested in practical, turning to reality. According to some of these teachers, they have a good relationship theory/practice, specifically in the discipline Didactics of higher education, which provides the opportunity of this integration.

A significant portion of these teachers said they had encountered difficulties of various natures in the course, but as participants of the teaching-learning process, found more meaning in the knowledge when they realized the relationship with practice. Realized in their experiences, in particular, offered by discipline Didactics of higher education, the ownership of knowledge via reflection and discussion of actual problems, concretes, experienced in the daily lives of University classrooms and the need to know the drive theory/practice in your relationship of autonomy and dependence.

In this research, the relationship theory/practice has also been analyzed according to changes in teaching job, in the face of new technologies. We observe that most graduate students already teachers, failed to make this relationship, just emphasized technical aspects of the use of new technologies. However, the vast majority stressed that new technologies assist and facilitate teaching, mainly the globalised Internet access that enables quick info to foreground, making the need for constant updating.

For these reasons we listed of teachers/specialists, new technologies make sense only when they help in teaching, research and to build better your space in the classroom. For some teachers, new technologies, if well used, to work with certain themes can help the student understand the practice, even showing virtually. On the other hand, some teachers highlighted live poorly and are not yet able to use new technologies, especially printing that true sense of the relationship theory/practice.

In this scenario, we stand that has happened frequently, particularly in universities, the coexistence with the lack of more modern equipment, even the teachers have access therefore is impractical lect wanting to take advantage of new technologies, even if there is availability for the acquisition of certain equipment for this purpose.

We believe that in the process of search of own practice, teachers looking to update the theory that had and did not realize the complexity of teaching-learning process, is looking beyond their own resources, new theories, theorists, and new methodologies best suited to the reality facing them.

Recognize teachers as able to hypothesize about their practices is a theoretical methodological principle, which allows us to consider the University as an area of theories and practices in permanent movement of construction, deconstruction and reconstruction. Accordingly, we give and give special emphasis to discipline Didactics of higher education, by signing, with the data collected, our hypothesis that the way has been developed in graduate courses at UFMG and UFV, can contribute to pedagogical training of teachers, working individually, collectively and collaboratively with the reflection of the daily practices of higher education and making improvements in teacher action.

It is interesting to note that was quite prominent in the third stage of data collection, although in the preceding steps have not been mentioned, the obligation imposed by the CAPES, through Ordinance 052/2000 repealed by Ordinance Nº. 052/2002, of students of master's and doctorate degree in teach. So, fellows, students are forced to make internship in teaching, corresponding to one semester of the master's course and two semesters in graduate school.

Several of these graduate students, who are already teachers in higher education, highlighted have colleagues in course that never delivered a lecture and do not have any kind of training, or even attended some discipline, that instrumentalize minimally to such even as teachers feel like starring roles in the process of teaching. Accordingly, we have the account of one of the teachers that so epitomizes this kind of sentiment: "... in the specific case of my course, students are treated like real kids and our advisors live at the expense of jobs that drove them to school and we are forced to give without any training, so they can ensure our scholarship, therefore, the degraded salaries, the grant is part of the budget and our survival ..."

According to the majority of teachers investigated, this type of teaching internship requirement seems to be made to cover the shortage of teachers in universities today, where there are deficits in tables and difficulties of hiring even teachers.

We believe that the graduate must fulfill a vital role in the process of preparing the lecturer, but to do so, must be careful, as stated in this study, associate the part pedagogical not unlinked, fragmented, but as a permanent dialogue with the specialized fields of knowledge.

In the current context of graduate programs these fields are unlinked, generally is unreal that if teaching meets a function without any kind of pedagogical preparation.

The initiative is very valuable thinking concretely to graduate as a space for university teaching practice, but for that to happen, it is necessary to rethink before this space as a continuing training that, in most courses, lacks any kind of pedagogical apparatus that can support the internship in teaching.

Subject to these settings, we believe that this stage of teaching should be extended to all postgraduate students, not only for fellows from CAPES and is designed in an integrated manner with the discipline Didactics of Higher Education, and worked in an interdisciplinary perspective, towards a coherent didactic action.

It is worth noting second Estrela and Estrela (2006), as cited in Simão et al. (2009) the continuous training is a concept polysemic referring to different visions, different sensibilities different ideological and epistemologies

For Simão et al. (2009) training in its current format is intended to improve professional skills, but should look the way it organizes and contractually for their suitability for professional situations and it is in this context we situate the important formative of didactic teaching disciplines imprint.

In post-graduation, regardless of course, it is necessary to include in the curriculum field disciplines such as pedagogical higher education Didactics and use media and computerization. It is essential to prepare students and teachers not only to use such equipment, but especially that they learn to speak critically reflective and creative in the process of production of knowledge. So, after attending these disciplines, we can assume that the internship in teaching may be well structured and leveraged by both parties. We observe, however, the difficulty of accomplishing this in practice, given the current restriction of deadlines in the postgraduate.

On these reflections, observations and investigative issues stemming from this process, you may want to emphasize some factors essential to the process of formation in postgraduate study, in particular with respect to the University teaching, contextualizing the University itself, the curriculum, in short, the fundamental elements that constitute the heart of this and other educational researches.

Note that for fostering, University of scientific production, the articulation of several areas of knowledge and professional qualification is understood not only as preparation of workforce productive, but as preparation of subject able to understand and deal with the contradictions of his time and build your own socio-cultural identity and professional.

The current moment is transitional in which seeks to build a more democratic, egalitarian society, pluralist and inclusive. It is significant that, with the process of democratization, educators have acquired a greater role in the debates and when forwarding proposals. Universities, particularly focusing on autonomy, come looking to perform experiments, changes and reforms in curricula. Note, however, that most of the initiatives are located and discontinuous, disappearing or periodic modifications with the weakening of leadership, the dismemberment of teams or simply with the cut or restriction of funds.

Take the student as a subject capable of transforming their learning in an emancipatory practice is to admit that our courses require changes every day at school level, able to introduce a new ethic and a new social practice, which involves articulating a new project for vocational training courses under the post-graduation configured in dimensions epistemological, political, social, cultural, scientific and technical cooperation.

CONCLUSION

When considering the progress achieved, in particular those gaps discussed in this study, we believe that some challenges may be delineated for the achievement of a new course "for the Didactics of higher education, for example: trail paths that mitigate or even overcome obstacles that implement a qualitative change in curriculum construction process, as the precarious dialogue between experts of specific contents and pedagogical content. We emphasize, in particular, that the data from this research have shown, both by graduate students as mainly teachers graduate, i.e. that they should invest in programs of graduate who configure education as social practice and the teacher as researcher critical-reflective of his teaching job.

The discussion of new teaching methodologies, the revision of curricula, with the insertion of new materials, processes of ongoing assessment of all activities will make it possible to identify a profile for the postgraduate courses, defining clearly the role they should play in society.

This time of transition from the world economic order and of the needs identified in this study brings the urgency in the drafting of V Plan National of Post-graduation (PNPG), whereas the graduate is the trainer

for fostering of researchers and professionals who work in the various levels of education, particularly in higher education. It is known that these professionals, teachers mostly don't have pedagogical formation, and therefore this new plan should propose means for Graduate Programs include in their courses alternate ways to cover the issue of pedagogical formation, suggesting the introduction of Didactics of higher education as part of the curriculum of graduate courses.

The little academic production, the training of professor of higher education in Brazil is one of the manifestations of an absence of policies that value and encourage this field of educational research, which is so important today, given the large growth of top courses in the country.

There have been advancements in the field of research, which prioritize the statistical parameters, which are systematized and offer a good standard for studies and reflections in the face of higher education policies. In contrast, in the area of training of University professor, not true fluency surveys which would give subsidies to political decisions concerning the processes of teaching, research, extension and administration at the universities, regarded as interdisciplinary fields, which represent a flow of relationships and tensions, and they are demanding new strategies for knowledge management in the face of new requirements for training and professional performance of teaching career.

293 - Coming to Know in the Eye of a Storm: A Beginning Teacher's First Year of Teaching

Cheryl J. Craig

Department of Curriculum and Instruction, University of Houston, USA
ccraig@uh.edu

Anna Dean: I began teaching in the eye of a storm
Cheryl Craig: How so?
Anna Dean: Let me tell you what happened... (Interview excerpt)

When researchers begin studies, they enter new inquiry fields where events have been unfurling longitudinally (Clandinin & Connelly, 2000). The same can be said for beginning teachers. When they launch their careers, they enter into school contexts where human experiences also have been temporally unfolding. They, too, arrive in the midst of things—with some things being immediately apparent and others becoming revealed through reflection. This paper is about beginning teacher, Anna Dean, and how her first year of teaching transpired. It centers on her experience of coming to know T. P. Yaeger Middle School, the campus where she was first hired. The work features Anna's developing knowledge of change efforts underway in her school context and her emerging sense of who she was in the throes of these initiatives. Before I probe Anna's 'learning to teach in the eye of a storm' narrative, I present the literature that undergirds this study and the research method I use. I then introduce Anna Dean, myself, and the state of T. P. Yaeger's school milieu prior to Anna's arrival.

THEORETICAL FRAME

Researched and written from the teacher perspective, this study examines the influence of specific reform initiatives on one school context, a beginning teacher's knowledge development, her emergent identity, her communities of knowing, and the stories she lived and told, and re-lived and re-told during her first year of teaching. The study is based on the understanding that teacher knowledge is personally and socially funded (Dewey, 1908, 1938) and narrative in form (Connelly & Clandinin, 1990). It coheres around Clandinin's (1986) conceptualization of personal practical knowledge, which is "knowledge constructed and reconstructed as [teachers] live out [their] stories and retell and relive them through processes of reflection" (Clandinin, 1992, p. 125). The stance respects the teacher as a curriculum maker (Clandinin & Connelly, 1992; Craig & Ross, 2008), one who is both a knower and a doer in the educational enterprise. Also integral to this research is the idea of teachers' personal practical knowledge being embedded in the context in which it is situated. To Clandinin and Connelly (1995), the contexts of teaching comprise a professional knowledge landscape composed of "relationships among people, places, and things [It is] a landscape that is both intellectual and moral" (p. 5). Needless to say, teachers' professional knowledge landscapes are constantly changing.

In addition to narratively accounting for the beginning teacher's knowledge and the context in which she taught, this paper also narratively explores Anna Dean's identity through her composing of "stories to live by" (Connelly & Clandinin, 1999, p. 4). In this paper, her "story to live by" shifted on a continuum of experience as her circumstances changed. But it also became altered in response to stories other people gave back to her. This feedback—or lack of it—additionally influenced how she made sense of situations. As with other human beings, "multiple I's" (Cooper & Olson, 1996) informed Anna's *in situ* knowledge.

The final piece of this theoretical frame has to do with teachers' communities of knowing. In this paper, two different versions of community are probed. In my research program, I previously conceptualized the idea of teachers' knowledge communities as:

> ...safe, storytelling places where educators narrate the rawness of their experiences, negotiate meaning, and authorize their own and others' interpretations of situations. They take shape around commonplaces of experience (Lane, 1988) as opposed to around bureaucratic and hierarchical relations that declare who knows, what should be known, and what constitutes 'good teaching' and 'good schools' (Clandinin & Connelly, 1996). Such knowledge communities can be both found and created (Craig & Olson, 2002, p. 116).

For instance, in my early work with beginning teachers, Tim (Craig, 1995a, 1995b) and Benita (Craig, 1995b, 1998), it became evident that they took different stories and different versions of their narrated experiences to different people in different knowledge communities for interpretation. Also, Tim's and Benita's inclusion in particular knowledge communities in their school contexts served as admission or denial of entry to other communities of knowing. Tim, for example, learned the pathway to leadership in his beginning years from the male assistant principal at his school. Benita, as a substitute teacher, did not come to know this story. Benita's temporary position, along with her particular knowledge community associations, precluded her from this text, but made other topics, particularly those concerned with how to work productively with students, parents and other teachers, readily available to her.

In their knowledge communities, the teachers with whom I conducted my early narrative inquiries paid close attention to the upsides and downsides of their experiences located on the intellectual, moral, personal and interpersonal landscapes of their schools. They became introduced to perspectives impossible to achieve through individual reflection. In their conversations, they made their practices transparent, and their knowledge and beliefs known in the presence of others. Additionally, while participating in their communities of knowing, they exercised their narrative authority (Olson, 1995; Olson & Craig, 2001) in ways that legitimated their own and others' narrative knowledge as embodied in people and embedded in situations. As a result, individuals' narrative truths (Spence, 1982) emerged in the interwoven stories publicly discussed. Through processes of layered meaning making, such truths became accepted as satisfactorily representing their beginning experiences from the standpoint of the individual as confirmed by knowledge community members. Furthermore, in teachers' communities of knowing, knowledge as the generative construction of personal meaning, as opposed to knowledge as attribute—codified lists of formal knowledge, which others declare worthy of being known, was emphasized.

In recent research conducted at T. P. Yaeger Middle School (Craig, 2009), I identified differences between knowledge communities as organically lived by Yaeger's teachers and the idea of professional learning communities externally imposed on them by the school leadership team, eventually supported by school district imperatives. At the outset of this work, it is important that readers know that professional learning communities have been defined by DuFour, Fullan, and many other researchers (i.e., Hargreaves, 2000; McLaughlin, 1995) mostly in the educational leadership and school change literatures. Such definitions outline what teachers should know and do in community. In other words, they project a formal view of teacher knowledge, which is significantly different from the practical view of knowledge around which my idea of knowledge communities is conceptualized. DuFour (2001), for instance, has stated that professional knowledge communities "focus on learning rather than teaching, work collaboratively, and [are] accountable for results." According to him (DuFour, 2004), "people use the term to describe every imaginable combination of individuals with an interest in education—a grade-level teaching team, a school committee, a high school department, an entire school district, a state department of education, a national professional organization, and so on" (p. 6). For the purpose of this work, I have introduced DuFour's definition of a professional learning community because the administrators and selected teachers at Yaeger attended his workshops at the request of the principal and supported by the school's reform funding. Hence, DuFour's notion of professional learning communities and how to implement them was presumably foremost, but not singularly, on their minds.

Before moving on to describe my research method, I sketch differences between teachers' knowledge communities and professional learning communities in Figure 1. The distinctions are important to keep in mind as this paper proceeds. They are matters I allude to in my forthcoming characterization of Anna Dean's beginning teaching experience and a theme, among others, I take up at the conclusion of this paper.

Knowledge Communities	Professional Learning Communities
Organically lived	Administratively introduced
Can be found or made	Expected to be present
Commonplaces of experience	Focus on learning rather than teaching
Relational among individuals and across groups; collaborations emerge	Collaboration anticipated at the outset
May exist within member of various groups; also occur between teachers who interact for their own purposes	Any visible group within a school/organization
Accounts of practice	Accountable for results

Fueled by a Practical View of Knowledge   Driven by a Formal View of Knowledge

Figure 1: Contrast between Teachers' Knowledge Communities and Professional Learning Communities

RESEARCH METHOD

This research enterprise was approached through the narrative inquiry research method. Narrative inquiries are studies of people in relationship by researchers who themselves are also in relationship (Clandinin & Connelly, 2000). Because it is a fluid means of investigation, narrative inquiry is a difficult method to live and even a more complex one to explain (Clandinin et al., 2006). This is because studies respond to phenomena encountered in the field as opposed to predetermined research principles (Connelly & Clandinin, 1990). Thus, "questions…do not begin with what theoreticians, researchers, and policy makers know [or want to know] but, rather, with what… teacher[s] know and [are finding] in professional practice" (Clandinin, 2000, p. 29). In a nutshell, the primacy of teacher experience (Eisner, 1988) is emphasized. In this particular paper, Anna Dean's first year of teaching is placed in the foreground while contributions from her fellow faculty members appear in the background, playing a supporting role.

Stories of experience in narrative inquiry are typically created using a variety of research tools to excavate teachers' knowledge in context. In this work, for example, teacher interviews and participant observation of classroom teaching, professional development sessions, department meetings, and faculty meetings, as well as document analysis, support the inquiry. These field texts were then transformed into research texts using three interpretive devices: broadening, burrowing, and storying and restorying. Broadening situates the research texts in the social, historical trajectory of events at Yaeger. In this paper, broadening principally accounts for changes that took place on T. P. Yaeger's professional knowledge landscape prior to when Anna Dean came to the school. Burrowing, on the other hand, involves an upclose look at particular experiences she lived in her first year. Burrowing mainly appears in Anna's 'learning to teach in the eye of a storm' narrative. Finally, storying and restorying captures transitions in Anna Dean's situations and interactions and how she made sense of them. But the process of storying and restorying also captures personal and social changes that occurred in Yaeger's professional knowledge landscape as a consequence of human interactions. For readers' information, field texts gathered from research participants before Anna Dean was employed at Yaeger inform the characterization of T. P. Yaeger Middle School prior to her arrival. Field texts collected after Anna became a faculty member at Yaeger illuminate the research text of Anna's 'learning to teach in the eye of a storm' narrative. Some of these texts originated with Anna whereas others came from other faculty members in the department and in the school who also participated in the research. Each educator formed an individual unit of analysis in the study. Others discovered what peers contributed when the account was seamed together.

Introducing Anna Dean

A native Texan, Anna Dean graduated from a state university with a Communications degree. After working in her major field for awhile, she entered an alternate certification program in a community college to prepare to become a teacher. She pursued the alternate preparation route because it was "the cheapest" entry into the profession and the most commonly available approach in the metropolitan area. Anna, who had a one-year old child, was in need of a reliable job with a reasonable income. Personally, she was in an unhappy marriage and on the verge of a divorce. She paid for her expedited teacher education program through working as a substitute teacher in one of the regional school districts by day and waitressing in a city café in the evenings and on weekends. She continued this arrangement even after she was certified because the large urban school district where she sought employment was in a hiring freeze. However, while surfing the school

district's website one day, she discovered a literacy teacher vacancy at T. P. Yaeger Middle School. She immediately took her resume to the campus; her interview was scheduled the very next day. On her hiring committee were two female literacy teachers, slightly older than her, "who were arguing with one another more than they were asking [her] questions." This meant Anna, of necessity, had to disagree with one. In Anna's view, these preliminary exchanges "set the stage" for how she would be "in the middle of things" from that point onward. Anna Dean indeed secured employment at the "plum middle school" in the large urban school district. But she also was introduced—in her words—"to enough games to last a lifetime".

Introducing the Researcher
My research program at T. P. Yaeger Middle School began in 1997 when I first moved to the U.S. from Canada. At that time, Yaeger was in the midst of a 'models of teaching' change effort supported by a major national reform movement, which was spearheaded by a consultant from one of the state's regional offices. The dissemination of the change effort depended on the consultant training 20 Yaeger faculty members and those faculty members correspondingly teaching the remaining teachers the changes they needed to make to their practices. However, the teachers at Yaeger found the 'models of teaching' reform problematic. First, they resented being taught by one another. Second, the prescribed nature of the teaching models stymied their natural desire to make curriculum "in the moment" alongside their students. Third, the models did not sufficiently address course content. And fourth, they did not account for the human particularities of their students (Craig, 2001).

Fortunately, a second national reform effort became introduced to Yaeger before the backlash against the models of teaching effort became too severe. I also was able to follow that initiative, which gave the principal and faculty of T. P. Yaeger Middle School considerably more freedom in choosing what initiatives would best suit the campus and the students peopling it. Among those changes were the introduction of Critical Friends Groups (CFGs), the combining of the assistant principal and counselor positions so that students would be better known, and the creation of a daily class period where students in different programs (Gifted-and-Talented, English as a Second Language, Regular Academic) and of different ages mingled and honed their leadership skills. Preliminary experimentation with the readers' and writers' workshop approach to literacy instruction was the fourth major change. The latter's purpose was to model a productive PLC for other departments in the school, which were also about to be reformed.

When the major national reform effort ended, the local office of the reform endeavor agreed to continue to support Yaeger's literacy initiative and my study of it (Craig, 2009, 2012, in press). As part of this third funded project, I came to know Anna Dean who was hired to replace one of three literacy teachers (14 in all) who personally or administratively had been moved or removed the previous year because their practices were seen as incompatible with how literacy instruction was supposed to occur at Yaeger. Hence, Anna entered the T. P. Yaeger school context "like a deer in the headlights," as one peer put it. She and I naturally came to know each other amid the happenings and goings on of the 2004-2005 school year. Several of her literacy colleagues already were participants in my study. It made sense that Anna participate as well. She joined the narrative inquiry of her own free will—in fact, at her own suggestion. In her introductory conversation with me, Anna confided that "she had become a member of the Yaeger faculty and the literacy department 'in the middle of something'" and that "little did she know she was entering 'the eye of a storm.'" Feeling "shell-shocked," she said she "wanted to think and talk things through with me." From the beginning, Anna saw me as an educator who provided a different perspective than her colleagues in her school milieu. According to her, I made her feel that she was "not alone" and that I "supported what [she] could not articulate, but what [she] was definitely witnessing and feeling…." As for some of the other Yaeger teachers and me, we also had formed knowledge communities—around different commonplaces of experience—as the investigation into how organized school reform efforts affect teachers' knowledge developments in context had been underway for seven years.

Introducing the Professional Knowledge Landscape of T. P. Yaeger Middle School
The social, narrative history of T. P. Yaeger Middle School patterns the development of the fourth largest city in the U.S. Advertised in the early years as being located on the city's "wooded edge," Yaeger currently sits on the longest street in Texas, a stone's throw away from the business center. Originally slated to be the high school for the upper class neighborhood surrounding it, the campus never expanded beyond the middle grades because history interrupted its projected expansion. The federally forced desegregation of the city's public schools resulted in 'white flight' to the suburbs and a mass exodus of sectors of the city population to private education. To manage the social and political upheaval of the 1970s, the school district, supported by the U.S. Department of Education, declared Yaeger a magnet school for gifted-and-talented students. This

resulted in qualified youth of all races and from all socio-economic backgrounds attending the campus. It also ensured that the students learning alongside the remaining upper crust neighborhood children were "the brightest and best" that the city had to offer. And the campus's later acceptance as an International Baccalaureate (IB) School further increased the campus's academic stature and enhanced its program offerings.

Over time, the principals assigned to Yaeger had backgrounds that reflected the eras in which they lived. For example, prior to the desegregation of public schools, one of Yaeger's principals headed up the White Citizen's Council, which advocated for the preservation of racial segregation of the city's public schools, among other things. The principal who followed him understood her mission as one of making Yaeger "the closest thing to a private school that a public system could offer." Somewhat later was the principal who led the way when my research project on the campus began in 1997. An elementary school leader, she, like many others of her generation, had been strategically placed at a secondary campus "to connect students' lives with the content areas they were studying," as she worded it. She additionally was expected to bring the programs, faculty and students that effectively were operating as "two schools in one" into a unified whole. This meant that gifted-and-talented classes would no longer inhabit the top two floors of the building and that regular program youth and their teachers would assemble in bottom floor classrooms. It also meant that funding among students enrolled in different programs would become more equalized. Implications for teacher professional development were wrapped up in these changes as well. For example, the 'models of teaching' reform initiative earlier mentioned targeted gifted-and-talented teachers. However, the principal felt strongly that her entire faculty should be given the opportunity to participate in the professional growth experience. Hence, she created the conditions for every Yaeger teacher to be involved.

The same principal also seized the chance for T. P. Yaeger Middle School to be a lead campus in a major national reform movement when it set up a local office in the city. Some saw her as exhibiting "the shiny balloon" syndrome (a long-term teacher's metaphor)—always chasing new and better approaches. One of the latter innovations turned the campus into a charter school, which exempted it from following certain policies and procedures of the district's schools. The underlying reality of the situation was that this principal could not grow Yaeger in the direction the faculty wanted without either convincing the school district that all middle schools needed to make the same changes or accessing funding from external sources and working around school district protocols. The latter approach she learned—and others concurred —was "the path of least resistance." CFGs were one of the first changes she introduced to Yaeger on the Friday afternoons she had specially dedicated to teacher professional development. It was a major *fait accompli* for her to gain school district approval, arrange early dismissal for 1500 students, re-organize 26 bus schedules, and revamp the school timetable to make it possible for Yaeger's teachers to systematically study their practices within regular school hours.

When this much-loved principal retired, she left T. P. Yaeger Middle School in a position where it had more discretionary funding than it ever had had. Thus, the principal who replaced her—an internal appointment who was equally well-liked—was able to increase the array and heighten the intensity of the changes while enjoying the decision making liberties that the school charter afforded. At the top of his agenda were the reading and English programs in the school. The retirement of one teacher and the subsequent shuffling of remaining faculty allowed him to terminate the school's Accelerated Reading Program. Largely a teacher-proof curriculum, the packaged program no longer fit with how education was being conducted on the campus. The principal simultaneously was able to alter how English was taught by dislodging it from its content area moorings and replacing the separate English and reading specialties with the literacy designation. This resulted in a reconstituted literacy department filled with teachers who no longer exclusively taught English or reading but were responsible for students' overall literacy development. About the same time, interest in the readers' and writers' workshop approach to literacy instruction was burgeoning. After the department head of the newly minted literacy department and two teachers (eventually three) attended sessions in an east coast state, it was decided Yaeger would experiment with the approach through hiring a consultant they met at the sessions (Craig, in press). The consultant was to serve in an advisory capacity because the faculty had already agreed and subsequently had been permitted (under the previous principal's leadership) to "control… professional inservice…[using] the intelligence amongst [the teachers]…" One major vehicle to achieve the latter, as earlier suggested, was CFGs. Among these was a CFG group especially tailored to the needs and interests of teachers new to the profession. In some instances, teachers new to the building also participated.

Not inconsequently, another reform initiative—instituted by the new principal and popular throughout the school district—was also simultaneously introduced: PLCs (DuFour, 2001, 2004; DuFour & Eaker, 1998; Wood, 2007). Of his own accord, the new principal arranged for several faculty members to accompany him

to Las Vegas to attend sessions where they learned that CFGs—the teacher-driven approach to professional development birthed under the old principal's watch—were passé. At the workshops, they were told they needed to "get beyond CFG groups and make the jump to PLCs," which would operate within grade-level clusters and cross-grade departments, structures already in place at the school. Also, despite CFGs being rejected as "artificially imposed" groups, CFG protocols would be retained because they were understood to be "efficient and effective" ways for teachers to interact in PLCs. According to one assistant principal, it was administratively thought that Yaeger's shift to PLCs "would not be a difficult process… because [the faculty] was already living so many of the [PLC] tenets." Such things as "extensive collaboration among teachers, action and experimentation in classrooms, and constant improvement," for instance, were already solidly in place on the school's professional knowledge landscape. Hence, in Las Vegas, representative Yaeger faculty members witnessed their principal transform into a "PLC man"—a male leader who had changed from actively engaging in open inquiry alongside teachers and fellow administrators in a manner deeply appreciated by all, to one "who had the answers" and expected others to arrive at "those answers." When one teacher passed a note questioning the wisdom of abandoning Yaeger's productively functioning CFG groups, the principal scratched OUT on the scrap of paper, promptly returning it to its sender. For the individual, this signified that the principal's "mind shift" was complete—"CFGs [were] not need[ed] anymore…We had outgrown them" was the message with which he and others returned from Las Vegas.

Because it was impossible for all 85 faculty members to attend the out-of-state PLC seminars, those who did not participate came to know the change in leadership perspective vicariously in the school building, which increasingly became called the "schoolhouse." Phrases like "failure is not an option" began to trickle into the school's vernacular. And "persistent discomfort" became the principal's new "management strategy." Its oft repeated logic was that "discomfort helps people grow and learn…" While purposely creating friction in others' lives seemed to work for the leader (who reportedly was experiencing challenges in his own), it did not seem to work well for most Yaeger teachers. The general sentiment was that the teachers' daily sense of security had been "robbed." In fact, in their private moments, long-term faculty confided that they were "most creative" when they were "happy," not when they were "feeling discomforted," a further phrase bandied about. Although the teachers continued to hold their principal in high esteem and understood that he was not intentionally being malicious, they also recognized he was "a force to be reckoned with." So did others on the leadership team who admitted that they had attempted unsuccessfully to moderate his approach. Hence, for one reason and another, the principal wielded a great deal of positional power. Also, in stark contrast to the former principal who worked with people's idiosyncrasies to retain good teachers, the new Yaeger principal, according to one assistant principal, increasingly saw people as being replaceable. In other words, one good teacher could easily be substituted by another. Hence, faculty members began to "walk on eggshells" because word was getting out that "if you were not on board," the administrative response could likely be "we don't need you here anymore..." For example, prior to Anna Dean's employment at Yaeger, the literacy department head who favored readers' and writers' workshop had left the campus purportedly because she could not reconcile how the consultant's presence at the school adversely affected relationships already in place. Thus, the remaining Yaeger faculty members, as one long-term teacher explained, were not necessarily "people who whole-heartedly believed in the [workshop approach]." Rather, they were "people who just were better at weathering the storm, knowing what the [potential] outcome could be, and detaching their emotions so they did not blow up and say something they would regret." In short, they were "survivors"—as another long-term teacher phrased it. Such was the state of the professional knowledge landscape of T. P. Yaeger Middle School when Anna Dean initially joined the literacy department.

Learning to Teach in the Eye of a Storm: Anna Dean's Story
When she first was employed at Yaeger in 2004-2005, Anna discovered that other teachers in the literacy department had been assigned common preparation periods whereas she, a beginner and a newcomer to the school, had her preparation time scheduled in a different class period. This meant that the experienced literacy teachers had the luxury of intellectually informing one another's planning and teaching and she did not. It also meant that it was easier for them to develop and maintain relationships through these natural interactions. The veteran teachers had "track records and time," according to Anna. She had "neither." Words like "alone" and "isolated" punctuated her description of herself. On one hand, she felt "cut off from the rest." On the other hand, however, she was "determined to survive."

For Anna, it did not take long before she awakened to the fact that the literacy department was splintered in a number of ways. Having sensed it in her job interview, she became convinced of it in her early interactions with her new peers. For example, Anna came to know that one of her female interviewers was one of the two department heads and a friend of the principal. That teacher had been among the first three faculty members

who went to the East Coast state and had been an early adopter of the readers' and writers' workshop method. As for the second teacher, she was not a department head, but a relative of another strong literacy teacher who would become Anna's mentor. And that interviewer was not against the workshop approach per se. But the image she held of T. P. Yaeger Middle School, not unlike her relative and the majority of other faculty on campus, was that it was a professional knowledge landscape where teachers had "input and choice." Hence, she was willing to experiment with workshop strategies, but was less than comfortable with others decreeing Yaeger a "workshop school." Consequently, she did not think Anna, a beginning teacher, should be forced to make an early commitment. Instead, she hoped the workshop approach would grow on Anna—as it was growing on her—and that both of them—through free choice—would support readers' and writers' workshop.

These two individuals, to a certain extent, generally represented the spectrum of opinion in the literacy department. The female department head earlier introduced had at least one other teacher and the principal supporting her as well as the two assistant principals who followed the principal's lead. Meanwhile, the other female teacher, Anna's second interviewer, had her male family member agreeing with her and was overtly backed up by the second of the original workshop teachers and more quietly by the third original workshop teacher, both of whom were women. This left eight other people in the department: one being the second department head (male); another being Anna. Aside from the newcomers (Anna and two others), the remaining five individuals (four females, one male) loosely agreed with the larger group of teachers. But they (including the male department head) were reticent to say so. Being close to retirement, they did not want to risk being transferred to more difficult urban schools at this juncture of their careers. Also, the veteran teachers were seriously reeling from the fact that a highly accomplished teacher had been administratively reassigned the previous year—not because of student performance (her students' test scores were among the best)—but because she resisted how language development was addressed via the workshop method. Some teachers admitted to weeping when they saw their colleague who kept her own counsel trudge across the parking lot one last time. They felt badly that they could not interact with her or bid her farewell. Some additionally felt terrible about the new teacher in her second year of teaching who also had been removed (as well as another teacher transfer) because her progress was not as stellar as expected. In one person's words, that beginning person had also been "attacked, brought down, and kicked out." All in all, the remaining literacy teachers were experiencing significant loss. This unavoidably affected personal friendships and existing professional relationships as well as future professional relationships, particularly with newcomers to the profession and others new to the school milieu. One long-term Yaeger teacher summed up what happened this way:

> Teacher: The principal was in his PLC groove and he wanted us to be a workshop school. Whatever we would be would be school-wide and PLC-related.
> Cheryl Craig: Was that ever discussed with everybody?
> Teacher: Actually, it would not have been a problem, probably, it was the way it was done by forcing people…I think a lot of people would not have been disturbed by what is basically an idea…
> Cheryl Craig: So you would have been okay with it, but it was the forcing that was the problem?
> Teacher: It was the forcing. He wanted us all as a PLC on the same page on the same day. Because kids, particularly in the GT classes and in the regular program, are just not on the same page nor do they need to be. It's just been hard, very, very hard…
> As for Anna, she offered a slightly different spin on the situation:
> > … The principal may have been using [the staff developer] to weed people out who were not fitting his version of PLCs. ...Not that he didn't think the staff developer had a lot to offer, which she did. They were trying to make cookie cutters of us…

In addition to the East Coast sessions in which literacy department members regularly participated, Anna Dean came to know that the literacy teachers also received whole group instruction from the staff developer, had the staff developer conduct demonstration lessons in their classrooms, and taught lessons themselves. She quickly found herself in the same position as the more experienced teachers. As a teacher new to the profession, she, too, had her lessons critiqued by the staff developer in the presence of their principal, the two literacy assistant principals (all three of whom were the teachers' formal appraisers), her literacy department peers, me, and of course, her middle school students who inescapably were present. In such situations, she more often than not felt "sophomoric." Nevertheless, the staff developer advocated this approach because, as she publicly explained, it was the way she had been prepared. And the principal supported the approach because it fit "the results orientation" of PLCs as well as the school district training

in which he concurrently was immersed. Also, Anna learned that there was a beginning movement afoot in the school district to connect student achievement with teacher performance, a thrust that would not be problematic to those instructing Yaeger's GT youth, but could certainly present issues for teachers in the regular academic program like herself, whose classrooms were peopled with learners relatively new to the English language. Although these students' learning curves were mostly normal, their test scores had not yet met grade level standards, a development that would not bode well where teacher incentive pay was concerned.

Needless to say, having 20-50 "entourage" visits—made possible by the in-district school charter—perturbed the vast majority of the literacy teachers whose classrooms in the rambling historical building were much smaller than usual. Anna especially spoke of how "intimidating" it was to be told as a beginning teacher that she was doing the workshop "wrong" when she was merely trying to figure it out. It seems the school's "persistent discomfort" focus was especially "discomforting" her because it denied her the positive feedback she desired. Also, Anna observed veteran teachers—some being highly versed in the workshop method— buckling under pressure due to "performance anxiety." She even witnessed the staff developer biting at the heels of the literacy co-chair, telling him—in front of all the people assembled (including the school administrators and his students)—that his class "was the worst GT class" she had ever observed. In Anna's view,

> [The observation process] was really awful. They [the principal, the staff developer, etc.] just went after people. I felt guilty simply because I was there listening to it and thinking, "Gosh, I'm glad they are not going after me, if you know what I mean."
> But Anna was not the only one who felt this way. One of the original workshop teachers echoed her sentiment, stating:
> …when I went into other people's rooms, I felt so badly for them…It was embarrassing. What was being said to them in front of kids and other teachers…. Even if it was justified, I don't feel it was in the students' best interests. It diminished the teacher in front of the children.

That individual went on to stress what was particularly disturbing to her as an experienced classroom teacher. She explained that:

> …it was the way it was done with all of these people with clipboards and the microscopic way they came in and zeroed in on me with one child. And the children [particularly those who were English-as-a-Second-Language learners and possibly offspring of undocumented workers] were very nervous. And I could feel the tension from them and how they looked at me as their leader. And when they saw me starting to falter and be nervous, they also were upset…

As for the second of the three teachers who originally spearheaded the workshop method at Yaeger, she retrospectively observed that "the intensity [of workshop] went up ten-fold" and "we lost the fun in all the intensity—we lost what you work with people for."

A further strong advocate of readers' and writers' workshop was Anna's mentor who, as foreshadowed, was the relative of one of the female teachers who initially interviewed her. While not one of the original workshop teachers, he, as a Mexican American, was well-known throughout the region for the culturally appropriate ways he engaged at-risk Hispanic males in reading and writing activities. Despite him arguably being one of the most marketable teachers in a school district populated mostly by minority youth, he, too, was unable to disrupt the way readers' and writers' workshop was being implemented at Yaeger. In spite of his valiant efforts, he could not sway how teachers—including his relative, Anna, and himself—were imposed upon. While he possibly could have mentored Anna in previous years when he was personally less stressed (the question remains for Anna whether young, professional males and females should be paired in mentoring relationships), it was difficult—near impossible—for him in this situation with everyone else in the department experiencing upheaval and stress. In fact, Anna's mentor did try to intervene. When the second department head (the male one) distributed a ballot inquiring how the staff developer's time would be best spent at the end of the 2004-2005 school year, Anna's mentor agreed with the majority of others. So did Anna. Having the staff developer help the teachers with their curriculum overviews for 2005-2006 (instead of visiting their classrooms en masse with clipboards) was democratically determined to be the activity most appreciated. According to an assistant principal outside the literacy department, it was blatantly obvious that the literacy teachers were fatigued by the high stakes testing which had recently occurred and "road-weary" from all the workshop/PLC "visitations."

But the attempt to alter the agenda of the professional development session only served to raise the ire of the principal. From where the principal was positioned, it seemed that a "conspiracy" was underway to "hijack" the change effort in which he had poured massive amounts of time, effort and money. Further to this, he appeared to feel "betrayed" by the literacy department members on whom he had admittedly lavished much attention. Consequently, he used the power of his position to push his preference through. In response, Anna's mentor and some other teachers contacted the staff developer, claiming their "voices were not being heard" in the mix. When the staff developer presumably communicated their concerns to the principal, he became increasingly agitated, believing his positional authority was being usurped by the teachers' narrative authority (Olson, 1995; Olson & Craig, 2001) and their desire to preserve that authority through having their versions of their lived experiences heard. A consequence of this was "a showdown" between the literacy teachers and the staff developer with the administrative team present and in apparently full knowledge of what was going to happen. It was, as one long-time teacher explained,

> …so confrontational…[The] staff developer pretty much instigated it and from what I heard and saw, it was a mean and ugly thing, something that should not be happening in a professional setting…There was so much tension, I think everybody thought something was going to blow…

And erupt it did, as the same teacher continued her explanation of what happened:

> The staff developer tried to play up the tension to where the person could just, you know, blow the engines. I'm coming through. I'm going to do this come hell or high water. This is the way it is going to happen. And it just intimidated us so badly…the demeanor, the manner, the culture…what was said and how it was said…I didn't like being bullied like that…

Of course, one of the major points of contention was the "excessive" number of visitors/evaluators that each literacy teacher had had in their classrooms during the 2004-2005 school year. And where state law was concerned, it was clear: the veteran teachers, who were on a relaxed evaluation schedule, could have as few as one formal assessment based on 45 minutes of observation once every three years, not 20-50 class periods per year allowed by the charter—with formal appraisers present. As for the more junior literacy faculty (i.e., Anna), they were to be assessed a minimum of one time per year also based on 45 minutes of observation by their assessors. A related difficulty—one repeatedly stressed—was the fact that Anna, a beginning teacher (with hands gestured in her direction, nonetheless), had been subjected to approximately the same number of classroom evaluations as others and that she had been unable to participate under the same conditions because she did not have a common planning period with them. In the contentious meeting, Anna openly admitted that she was "drowning, drowning, drowning." And her mentor backed her up, saying Anna only received quick advice here-and-there in the hallways between class changes. When one experienced, but new-to-school teacher assessed the problem as being "like an onion with many layers… and that the faculty never seemed to get past the layers to address the core issues," Anna Dean and others pleaded that she cease talking. Having been urged all year to use her voice, that same teacher was now strongly advised—by a chorus of peers—to suppress it. The stark truth of the matter was that they feared her job—and theirs—were on the line.

Furthermore, the tensions in the literacy department did not disappear in the aftermath of the highly problematic staff development session. In fact, the acrimony escalated when the principal upped the ante by requiring the teachers to sign an oath to show their commitment to the workshop approach, and to confine knowledge of their struggles to the literacy department so that news of the discontent would not spread throughout the school context where other faculty members were increasingly becoming disturbed by what was happening and having their future employment opportunities threatened as well. Also, if the literacy teachers did not go along with signing the oath, they would no longer teach at Yaeger. In other words, if they did not comply with the principal's edict, the terms of the school charter would be further invoked and the literacy faculty members would have no other choice but to leave like "a parade of teachers" had previously done, as one participant worded it. The oath, according to another long-term literacy teacher, "kind of crept in…like Nazi Germany." To yet another experienced participant, what happened was "an emotional drama…[where] we were held under fire and ….muzzled. We had to sign…affidavits. We were ordered. It didn't feel professional at all."

In Anna Dean's first year at Yaeger Middle School, the campus lost five more literacy teachers: the onion-story faculty member, a special education teacher, Anna's mentor, her mentor teacher's relative (one of the teachers who initially interviewed her), and one teacher who personally chose reassignment rather than continuing to teach under such conditions. Also, one of the literacy department assistant principals resigned from her position as well, genuinely troubled by what had transpired and the accomplice role she was

perceived to have played in the melee. Further to this, the principal was promoted: he became a regional leader who would have continuing influence on—and power over—T. P. Yaeger in the years to come.

REFLECTIVE ANALYSIS

A number of themes available for reflective analysis are interwoven throughout Anna Dean's narrative of her first year of teaching. Among those themes are (1) different versions of teacher community, (2) shifting school landscapes| shifting teacher identities, and (3) the eye of the storm | the perfect storm. Each of these themes will be unpacked separately. The paper will then end with some closing remarks.

Teachers' Knowledge Communities | Professional Learning Communities

When Anna Dean enrolled in her teacher preparation program, she, like other preservice teachers, was generally introduced to PLCs (CFGs and Readers' and Writers' Worship as well) as 'best practices'—practices deemed to work for "every teacher, every learner, every time." Such practices were held up as universal solutions to school and curricular problems and prime vehicles to spearhead educational change. Such approaches were also typically presented as if nothing existed in teacher relationships or on school landscapes before they were introduced or as improvements to old models that had been previously implemented (i.e., PLCs touted as being able to accomplish what CFGs had not). Exemplary qualities of community that may have already been in place in professional relationships in schools like T. P. Yaeger tended to be attributed to initiatives grafted onto them by administrators and school reformers, rather than as inherent fruits of prime teacher interactions naturally occurring among members of the profession. No preparatory conversation was directed to the idea that PLCs were mere facsimiles: institutional proxies aimed at mimicking and replicating teacher knowledge communities, administrative efforts to institutionalize something that was already present and active but difficult to instantiate (bottle/trademark) in their current form. Stated differently, PLCs are nothing more than leadership attempts to make formal, visible and accessible human knowledge-using and creating relations that are, by their very nature, informal, invisible, and difficult to pin down due to the number of educators interacting inside and outside of school milieus and the overall social-historical-emotional-relational-intellectual complexities present on teachers' professional knowledge landscapes.

Readers learned that, when Anna arrived at Yaeger, she discovered, not by virtue of her formal education but through her personal knowledge carved through her experiences in context, that the veteran teachers had natural ways of interacting with one another when left to their own devices. She in fact witnessed these multiple knowledge communities at work. She saw how the teachers fruitfully used relationships with one another to support, improve and communicate the subtleties of their literacy practices. Anna additionally learned, as most beginning teachers do, that her isolation as a newcomer, aided and abetted by her less-than-ideal timetable, precluded her easy entrée to these communities. Another prohibiting factor, specific to Anna Dean's case, was the loss that veteran Yaeger teachers had experienced when a beginning teacher was not retained the previous school year. The fact that Anna's mentor was male furthermore may have denied her access to certain other literacy department associations. Despite all of this, Anna Dean was astute enough to recognize that these communities of knowing were something she wanted to tap into, having already figured out that I, too, could be a knowledge community for her, albeit a different one.

Anna also witnessed the Yaeger teachers' rebellion when PLC parameters were used to dogmatically direct and control what happened in their professional associations with one another and in their face-to-face teaching of students in their classroom milieus. It seems the administrative overlay of the PLC imperative seriously interfered with the teachers' naturally occurring knowledge-using and knowledge-creating relationships, replacing the productive collegiality and natural collaborations that organically existed among faculty with intense feelings of suspicion and distrust. "The inorganic combo," in Anna's words, "made [everyone] scared—especially [her]. People did not know their colleagues any longer…No one knew who would tattle on whom…" She witnessed how hierarchal power was used to advance the administrative agenda—even while losing some of the ablest, most prepared faculty. Also, in the background was the charge that PLC proponents leveled at CFG groups, which was a criticism that could equally be extended to PLCs. Whereas Yaeger's CFG initiative harnessed the intellectual energies of willing teacher participants, involved beginning teachers in relevant ways, and provided all teachers with open-ended processes they could generatively use, PLCs, as implemented at Yaeger, were undisputedly under the principal's thumb. What became sanctioned as good practice was what administration preordained as good practice. Beginning. Middle. End. Other gainful approaches—even those resulting in outstanding standardized test scores—were outlawed.

Shifting Landscapes | Shifting Identities
When Anna Dean came to Yaeger, she entered a professional knowledge landscape that was in rapid transition. Whereas the previous principal had cultivated teachers who put their personal stamps on their practices and were praised for their individual signatures, the current principal favored a "cookie cutter approach" (to borrow Anna's phrase) to both teacher and program development. Consequently, certain teachers whose practices had been "golden" during the previous principal's tenure were risking expulsion under the present principal's leadership. Some who had been complimented for being "voiced up" had basically been told to "shut up." Anna herself had been issued this warning by colleagues and school leaders alike. Most certainly, teacher professionalism and leadership were under serious attack at Yaeger. Paradigmatic change was underway—and community was the guise in which it was dressed. But fundamental questions remained: Whose version of community? What implications for teacher identity are couched in different conceptions of community living? And, how do comfort and/or persistent discomfort spur or stymie individual and community growth?

As an impressionable beginning teacher, Anna was assigned a mentor whose reputation as a literacy teacher was sterling both inside and outside the school context. Over the year she worked alongside him, she saw how his sense of security was challenged and how his professional voice as an expert educator was stifled. She witnessed his job satisfaction turn into ferment, eventually giving way to his personal decision to transfer from Yaeger. Anna also observed how the teacher from her job interview panel trembled and sobbed over the multiple classroom visitations and the less-than-complimentary utterances during and after the observations. Further to this, Anna heard stories of how former beginning and experienced teachers had also had their practices "halved, quartered, and divided" (a Southern U.S. expression) with their peers and students serving as eyewitnesses. In these instances as well, she saw experienced teachers' productive 'stories to live by' (Clandinin & Connelly, 1999)—that is, their identities in the making—becoming 'stories to leave by' (Clandinin, Downey, & Huber, 2009). Here, too, implications for beginning teacher identity formation also arise. Most specifically, should Anna, the newcomer, compose her 'stories to teach by' using the strong narratives of those who moved to other schools, willing to stand up for what they believed in, or should she choose as narrative exemplars the tales of those who remained at Yaeger and silenced desires they held for their students and themselves in order to retain employment? And what particular experiences—and the ways in which they were responded to—contributed to the morphing of teachers' stories of staying into teachers' stories of leaving? To which career markers should beginning teacher, Anna, specifically be awake?

The Eye of the Storm | The Perfect Storm
Anna Dean's narrative is chronicled through the extended lived metaphor (Lakoff & Johnson, 1980) of 'learning to teach in the eye of a storm,' an unprompted comparative frame around which Anna's beginning teaching experiences cohered for her. The metaphor Anna lived in her first year of teaching exemplified how her experiences unfurled in somewhat of an insular fashion at the eye, while persistent discomfort swirled around her on the storm's periphery. But as the tumult on T. P. Yaeger's professional knowledge landscape gained speed and intensity, she increasingly found herself at the vortex, embroiled in issues veteran literacy department colleagues also experienced. Like all storms, the turmoil at T. P. Yaeger Middle School involved multiple forces, created human destruction, and was watched in a spectator fashion by those given no option but to helplessly observe. In fact, what transpired at Yaeger could be considered a perfect storm—with all of the weather conditions for a nasty situation present inside the school milieu—thanks to the charter's less benevolent application—and equally evident outside of it—with demands for accountability, standardization, and value-added assessments of teachers' worth gaining momentum and afforded highest priority.

CLOSING STATEMENTS
Anna Dean's self-selected 'eye of the storm' metaphor also aptly portrayed the research process I lived as an embedded, collaborative researcher. When this study first began in 1997, I could not have predicted the events that would have unfolded at Yaeger. Neither could I have imagined the fate of some of Yaeger's strongest faculty who would move on to become teacher leaders at other district schools or in other school districts. Also, I would not have thought that the ravage would be tolerated by the faculty—out of trepidation—and by the school district—due to the enormous disconnect between the ubiquitous system and what actually happens to flesh-and-blood teachers and students in real-world schools. Most of all, I could not have fathomed the dwindling respect for teacher professionalism and the lack of a constructive presence of professional organizations working on teachers' behalf.

Thankfully, storms on the professional knowledge landscapes of schools do not only break, lash, hit, and blow. They also abate, subside, and pass. But then other storms can mount, following quickly in the path of those that came before. Anna Dean's tenure at T. P. Yaeger Middle School continued for four additional years. Weather reports further illuminating her 'eye of the storm' narrative are in the offing.

> *Living, telling, retelling and reliving [stories] mark the qualities of a life…, a [paper] on narrative inquiry, one reflective of this ongoing quality of life, simply stops at some point or when the author…say[s] enough is enough…at least for now… (Connelly & Clandinin, 2000, p. 187).*

Author's Note: The author extends special thanks to Anna Dean and many the many other faculty members of T. P. Yaeger Middle School who contributed to this narrative account over time.

306 - Chinese Teachers' Perceptions of Professional Development: Findings from Ongoing Research

Qi Song

Nanjing University of Posts and Telecommunication,Campus of Xianlin,210046,Nanjing,China
songqi2006@gmail.com, songq@njupt.edu.cn

Abstract: This article investigates Chinese teachers' professional learning and development. It analyzes the factors that hinder or facilitate their professional learning and development such as school culture and leadership. Data were gathered through a questionnaire (n=493) with beginning and experienced teachers in Jiangxi Province, middle China. Findings suggest that Initial Trainning and In-service Education are undervalued and they support the importance of observation of colleagues' teaching and teaching practice.Learning is view as a practical and trial-and-error process and reflecting upon one's own practices emerged as one of the most difficult features in professional learning. Poor school leadership and staff are not encouraged to participate in school activities emerged also as key issues from the data. The school culture and relationship perceptions however are not so bad as school leadership perceptions. Heavy workload, scarcity of resources, lack of time are the top three reasons that hinder teacher's professional learning and development

Keywords: professional learning, teacher professional development, school culture

INTRODUCTION

There has been a long research history for the teacher professional development in China.The most famous educator in ancient China named Confucuis, Confucius has rich and deep thoughts about teacher professional development. Such as"To commit knowledge to memory quietly, to study tirelessly, and to enlighten others indefatigably — these are not difficult for me." "If one can have new inspiration by reviewing what he learned before, he is qualified to be a teacher.". "Teaching benefits teachers as well as students. "Confucuis' research about teachers' professional learning and development has profound impact for Chinese till today.

The research of Teacher professional development has stopped for a long time since then, the widespread research in modern China has begun from 1980' and has gained more and more attention of researchers,policymakers, teacher educators. According to the Teachers Law issued in 1994(Law number 1/3, 1 January), Teachers are professionals who exercise the functions of education.This is the first legal confirmation to view the professional status of teachers. According to the Regulations on the Qualifications of Teachers issued by Chinese government (1995) and Regulations for Implementation of Teacher Qualification issued by the State Education Commission(2000), Regulations for implementation of teacher qualification has begun all over the country.In the beginning of 21st, Chinese government has begun to use the conception of teacher education, and put forward the task of how to promote the teacher professional learning and development and take it as the main direction of Chinese teachers education reform of development.

Teacher professional development were written from different instances by Chinese educators. Some educators deemed the growth of teacher professional development has experienced four phases as follows: begnining teachers, Qualified teachers, key teachers, professional teachers(Zhong, 2001). Chinese educator said the professional teachers are the highest stage, it is the marks of the teacher has become action researchers.From 1990', teacher professional development community has begun from the New Curriculum Refrom (Shang,2005; Wang, 2010; Ling, 2010). There are three administrative levels including four modes, such as collaboration between school inspectors and teacher (lesson-dicussion mode), collaboration between university and school (subject-research mode), collaboration between teachers in the same school (based-school-research mode and prepared-for-lesson-together mode(Shang,2010). School-based curriculum is another Important areas of research of teacher professional development (Zhao, 2010; Song, 2007; Liu,2005). The most popular conception of teacher professional development was described as three stages: Pre-vocational education, in-service learning, post-job training.

METHODS

The Pre-vocational education is the education for the begnning teacher, this paper is part job of an onging research of begnning teachers. Data were gathered through the Questional on Teacher Professional Learning and Development(QTPLD). To capture the data,the questionaries were carreid out in Nanchang City and Pengze County of Jiangxi Province, in middle China; Nanchang is a middle-level city and Pengze County is a poor country area in China. The schools were selected on the basis of typical Chinese criteria: type of school (rural,inner-city,and suburban) and level(top, common,). With the rapid development of its economic development, Chinese teacher education has made big progress. Nowdays, most of Chinese teachers not only in city inner-city but also in rural and suburban areas, most of teachers hold permant positions, and the delopma has also improved greatly.700 QTPLD questionaires were sent randomly to 18 middle and primary schools. Only 493 quesionaires are useful, many teachers take a negative attitude to the investigation. They claimed no interest, no time.

FINDINGS

Table 1: Contexts of Profssional Learning(%)

ITEMS	Strongly agree	Agree	Disagree	Strongly disagree
a)My professional learning occurred (or occurs) in isolation based on private practical teaching experiences in the classroom.	26	69	5	0
b)My professional learning occurred during my teaching practice/professionalisation.	24	71	5	0
c)My professional learning occurred during my Initial Teacher Training.	3	20	71	6

The vast majority of the respondents(n=493) claimed their professional learning did not took place during their Initial Preparation (77%), most of respondents agreed the importance of teaching practice(95%). Teachers claim their learning occurin isolation based on private practical teaching experiences in the classroom(95%) [Table 1, a, b, c] .

Table 2: Teachers' Views of Professional Learning (%)

ITEMS	Strongly agree	Agree	Disagree	Strongly disagree
a)Professional learning is a social process which is influenced by the norms and values of the workplace.	6	36	56	3
b)Professional learning is an idiosyncratic process depending on one's own personal biography.	20	68	11	1
c)Professional learning is a practical process depending on the educational settings in which teachers work.	33	65	2	0
d)Professional learning occurs according to a trial-and-error procedure.	64	35	1	0

In Table 2, teachers regard learning is view as a practical (98%) and trial-and-error process (99%) and reflecting upon one's own practices emerged as one of the most difficult features in professional learning.

In Table 3,scope of professional learning, most of Chinese teachers agree with the scope of professional learning all stated in Table 3.

Table 4 shows the process and the preferences of learning of new(less than three years of teaching) and more experienced teachers. Teachers stated that they learned continuously by analysing students' reactions in the classroom, by trying out new strategies in the classroom which they have devised, and by observing their colleagues teaching. [Table 4 e, m,b and d]. Learning by attending conferences and seminars, attending in-service education courses were valued less by the respondents.(Table 4 k and q). Also, attending in-service education courses was not a major process from which teachers learned(Table 4,i). Poor school leadership and staff are not encouraged to participate in school activities emerged also as key issues from the data(Table 5). Heavy workload, scarcity of resources, lack of time are the top three reasons that hinder teacher's

professional learning and development.

Table 3: Scope of professional learning （%）

ITEMS	Strongly agree	Agree	Disagree	Strongly disagree
a)Professional learning is about the acquisition of the technical knowledge and skills required to be a teacher.	27	70	3	0
b)Professional learning is about the capacity to develop classroom-related teaching strategies.	25	70	5	0
c)Professional learning is about the ability to make sense of classroom events.	15	70	15	0
d)Professional learning is about the capacity to solve problematic situations.	12	72	16	0
e)Professional learning includes the analysis of teachers' own beliefs and images of teaching.	15	70	14	1
f)Professional learning is about the ability to make decisions according to the context.	16	78	6	1
g)Professional learning is about the capacity to analyse and reflect on the aims and values underlying one's own action.	16	79	5	0
h)Professional learning includes the capacity to analyse and reflect on the aims and values underlying the institutions in which one works.	19	64	17	0
i)Professional learning includes the capacity to investigate and reflect upon one's own practices.	33	66	2	0

Items	Mean Score	SD	Rank
a) Heavy workload	2.35	.816	1
b) Personal problems	2.89	.813	4
c) Classroom conditions	3.16	.881	9
d) Lack of motivation	3.12	.823	8
e) Working conditions at school	3.08	1.585	7
f) Lack of guidance and support	2.93	.845	6
g) Scarcity of resources	2.44	.921	2
h)Lack of provision of relevant courses or opportunities	3.20	.815	10
i) Lack of time	2.62	.771	3
j) The isolation in which I work	2.90	.810	5

CONCLUSION

There is neither law nor any kind of formal ITT course in China for teachers, teachers has no conception of ITT. There has been a long tradition in China that beginning teachers were cultivated by experienced teachers, so teaching practice is very important in China.The reflective teaching also has an uncomparative position.

The phenomenon of exam-oriented education is still very serious in both primary and middle school in China. With the One-Child Family Policy and improvement of living condition, students are trained even from the kindergarten.So the workload and pressure for teachers is very high,they lack of time to pursuit of their professional development.Teachers are not lack of relevant courses or opportunies,classroom conditions and motivation are also undervalued.

311 - Teaching and Teacher Training: A Vicious or Virtuous Circle?

Hustana Maria Vargas

Universidade Federal Fluminense - UFF
hustana@gbl.com.br

INTRODUCTION

The professional aspect of teacher training is in the core of a more general context of teachers' work. Undoubtedly, one of the most marking aspects of this work's conditions, as cause and consequence of many problems, is its insertion in a career framework.

At which point of this framework are teaching careers? What would indicate their level of professionalization compared to other careers? What consequences for the teaching work may be anticipated from this relative position of teaching in the general career framework? Let us examine this situation from the Brazilian viewpoint, trying to compare it with other realities.

PROFESSIONALIZATION IN BRAZIL: GENERAL AND SPECIFIC ASPECTS

The thematic approach of professions becomes more relevant as modern society proves professionalized. According to Barbosa (2007), "professionalism may be considered the modern way to organize social inequalities". What happens, as stated by the same author, is that professions become social groups – professional groups – with great capacity to organize social relations; this capacity starts to influence the world's structural and hierarchical organization as a whole[88]. This arrangement makes professionalization a tool for social mobility, because "professionalization is the collective project of social mobility that eventually guarantees monopolies on service provision and certain privileges in the occupational structure" (Bastos, 2004, p. 57). Professional hierarchization is the peculiar manner to organize these inequalities (Larson, 1997). Therefore, the existence of a rigid career hierarchy reflects the unequal conditions surrounding the exercise of occupational privileges and monopolies.

In the Brazilian case, we may talk about a State constituted by professional groups. Beyond physicians' universal and everlasting prestige, the State's formation and maintenance may be associated with the support by two groups: lawyers in colonial Brazil; engineers, indispensable to the movements of industrialization; and again, lawyers, in the transition to the third millennium, within the judicialization of social relations (Barbosa, 2003, 2007).

The case of lawyers is illustrative. Although higher education has not occupied the central position it took in the 19th century in Europe and the United States, university graduates were decisive actors in the construction of the Brazilian national State. Especially significant is the contrast between the importance of Brazilian founders, predominantly jurists, and the weight of the military in the foundation of Ibero-American countries. José Murilo de Carvalho (1980) evidenced, when studying the political elite of the empire, our legal formation initiated at the University of Coimbra, making up the first generation of statesmen, as the essential ingredient of the Brazilian mandarinate. Possibly, there was, from Coimbra to Brazilian law schools, an internalized process of constitution and replacement of the mandarin network, efficiently continued during our whole history. Nowadays we still may observe the predominance of Law graduates in the Brazilian political administrative representations.

Such a circumstance does not go unnoticed by students. For 80% of university graduating students in 2003 and 2004, "undergoing professional training is the main contribution of the course. That is, students attend higher education in search of a profession" (Ristoff, 2006, p. 91).

As a result, between 2002 and 2009, the estimated number of people with a university degree in Brazil according to the PNAD changed from 6.9 to 12.2 million. It represents a 74.8% increase, what corresponds to almost 750 thousand new graduating students per year. The highest increase was observed among women; in the category color, among blacks and mixed-race people.

By career, the highest increase was that among teaching professionals with higher education degree. They were 1,076 million in 2002, and changed to 2,096 million in 2009, a 94.7% increase. In total, 80% of these professional taught elementary school. This increase is explained by the high number of elementary school

---

[88] Social marker of great importance, for example, to presentation rites in society.

teachers who graduated in this period. In 2002, there were 2.7 million teaching professionals, 46% of them with a university degree; in 2009, there were 3.7 million, 61% with a university degree.

In that period, income differences due to schooling decreased, but attaining higher education still means to earn 193% more than average, compared to 173% in 2002. The advantage of people who have a university degree over those graduated at high school was three times in 2002, against 2.8 times in 2009 (income of all works by people over 18). Income varies among the several occupation groups with higher education, but differences in relation to those with no degree are very significant. The average income earned by teaching professionals with a university degree is R$ 2,022.00, a difference of 59%. For professionals of the exact sciences and engineering, it is R$ 4,375.00, a gain of 117% (Schwartzman 2011).

Even with all those advantages, disparities in the salary return of careers stand out. It is a matter of concern to us in so far as we worry about the working conditions of education professionals.

HIGHER EDUCATION, PROFESSIONALIZATION, AND CAREERS

As salary differences among careers stand out, there is another related point to be discussed: higher education is the field of professionalization, par excellence. Professions, in turn, are divided according to their institutional character, organization, political weight, social prestige, etc. Each one of them will fall into a corresponding pattern of social, economic and symbolic profitability.

For that reason, we cannot ignore the fact that the respect achieved by bearers of university degrees brings internal distinctions, translated into career hierarchy. Taking higher education as the constituting and safekeeping field of professionalization and profitable titles in the economic, social and symbolic market, we understand that any investigation about it must be careful to avoid generalizations. Thus, we did not conceal the selection of courses in our study; quite the opposite, we privileged it.

The more or less generalized context of devaluation experienced by teaching-related careers is a source of worry, because it constitutes cause and effect of a lot of difficulties related to teacher formation, in a kind of vicious circle. Accordingly, the low perceived status and the low remuneration rates of these careers, usually lacking professional associations that may strengthen them, conform to the inadequate job supply for present and future teachers. Inequality between these and other careers is considerable and extends over time. Many of the problems experienced in the daily process of teaching training and practice – despondency, shortage of material and academic resources to complete a course, limited political bargaining power – originate in this field.

The social effects of these careers' lowliness have been easily observed in Brazil: elementary school teachers with a university degree earn less than the average population with similar instruction level. Considering teachers with no university degree, the salary average is inferior to that of the total population, according to tables from the 2006 PNAD (Salário, 2008). Probably related to this fact, we may verify a shortage of almost 250,000 teachers at Brazilian public schools, taking into consideration the needs of middle and high school in Physics, Chemistry, Biology and Mathematics (Faltam, 2007). One cannot say that these teachers do not exist: an unpublished study by the Ministry of Education (MEC) demonstrates that except for Physics and Chemistry, there are more graduates than necessary to teach all the classes wanting teachers. The survey claims that there are enough graduate teachers to meet the demand, but they choose other jobs (Falta, 2007).

This external aspect of unprestigious careers attained by teacher education programs has a counterpart inside post-secondary education institutions, where these courses also lack prestige. Comparing facilities, number of professors per student, the hours when the courses are offered, and research grants, there are hierarchical distances among schools within a university. In a debate about democratization of the campus held by INEP, one of the lecturers affirms: "university decision-makers are internally investing more in courses chosen by the elite. Wise investments, though, are not made in courses joined by the poor" (Santos, 2005, p. 83). On the other hand, a Chemistry student of an evening course at UFMG stated about that point: "UFMG conceals the fact that there are no serious initiatives for the promotion of social inclusion. In the evening there are no speeches, seminars, courses. Our formation is restricted to the core curriculum. Libraries are close and I have difficulty in borrowing books. Everything is much more difficult" (REDE, 2006).

The social composition of the different courses reflects and nurtures this hierarchy. From the entrance examinations to the exams that reveal the profile of graduating students, what stands out is the influence of social condition on the distribution of courses and their regular attendees.

STUDENTS' SOCIOECONOMIC PROFILE, CAREER, AND PROFESSINAL DESTINATION

Nogueira (2005) shows the several aspects of career choice in school trajectories: "[...] the choice of an undergraduate course may be described as the result of a set of perceptions (beliefs and values explicitly fostered or tacitly cherished as practical knowledge) that one holds in relation to himself and the acting

environment" (p.11). The correlation between "social place" and individual perception supports the occurrence of self-selection in the choice of an undergraduate course, joining the objective and subjective dimensions of reality.

In order to face this problem we must ask what kind of profile, in socio-economic terms, has teaching attracted. May one think of recruitment in close affinity with vocational perspective? What bargaining power as a professional category would these professionals have to use in keeping monopoly and privileges that guarantee respect for their career? Which position inside universities is occupied by teacher training courses in relation to funds, symbolic expression, and input? To discuss this subject, we conducted a study that deals with career hierarchy in higher education, the socioeconomic profile of undergraduates of some careers related to teacher formation, and the position of these careers in the Brazilian university context. The selected careers were Language and Literature, Mathematics, and Biology, courses that traditionally form teachers and reflect three great knowledge areas, in a time series.

For the purpose of conducting this study, we made use of micro data from the "Provão"[89] (a test for undergraduate students, which evaluates higher education in Brazil) in a time series from 2000 to 2003. This series could not be enlarged because in 2004 the system to evaluate higher education changed, with the conduction of an exam that adopted another methodology (the National Exam of Students' Performance – ENADE). The "Provão" was taken by all undergraduates, together with a socio-economic questionnaire.

From that questionnaire we selected some indicators that literature considers advantageous in the schooling process: parents' titles, income, occupation status, school of origin, color, and marital status (Foracchi, 1997; Martins, 2006; Schwartzman, 2000). The examination of these indicators' behavior in each career compared with all the others present at the "Provão" in those years started to guide the study.

We called the group of those other careers "General". In 2000, the "General" category comprised the following courses: Management, Agronomy, **Biology**, Social Communication, Law, Economics, Engineering, Physics, **Language and Literature**, **Mathematics**, Medicine, Veterinary Medicine, Dentistry, Psychology, and Chemistry. In 2001, it included all those and also Pharmacy and Pedagogy. In 2002, Architecture, Accountancy, Nursing and History were added. In 2003, it had all the previous and Speech and Language Pathology, and Geography.

T

he evolution of some of these indicators is presented in the following Table.

Table 1 – Economic variables, by career and "General" group – 2000-2003

YEARS	Groups/Careers	White	Higher Education		Does not work	School of origin
			Father	**Mother**		**Private**
2000	General	**80.17**	**30.13**	**24.34**	**31.64**	**43.18**
	Language/Literature	70.64	9.65	9.95	20.70	20.77
	Mathematics	73.19	8.39	8.90	18.77	18.63
	Biology	74.06	19.82	17.79	37.08	33.22
2001	General	**77.48**	**26.74**	**22.68**	**30.55**	**39.69**
	Language/Literature	68.98	8.93	9.80	19.66	20.56
	Mathematics	67.10	8.13	9.30	17.43	20.03
	Biology	71.53	19.02	18.30	34.56	33.28
2002	General	**76.10**	**24.55**	**21.49**	**28.48**	**35.18**
	Language/Literature	69.85	9.50	10.26	19.09	18.97
	Mathematics	64.37	7.68	9.40	18.41	17.70
	Biology	71.49	20.06	19.37	35.13	33.34
2003	General	**72.68**	**24.05**	**21.95**	**28.27**	**35.03**

---

[89] Provided by INEP in CD-ROM on request or downloaded from the site. The database was set up in SPSS.

The three selected courses are more socially unfavored than those of the "General" group. There are **fewer** students who are white, single, have undergraduate parents, come from private secondary schools, and have high family income – in the teaching careers than in the "General" group.

Later we examined the evolution of data over time, observing a pattern of stability in all indicators, not reflecting alterations of socio-economic profile in the courses. It is important to highlight that the studied years correspond to a moment of higher education expansion, with increased enrolments, what could have changed the socio-economic profile of undergraduates in these courses.

TEACHER TRAINING "FROM THE INSIDE"

Would this whole previously described asymmetric situation be reflected inside the institutions of higher education? This is what we are discussing next. The observed vicious circle establishes a reality in which the equation terms denouncing inequality are responsible for nurturing it.

As we have seen, low social prestige and low rates of remuneration in some careers – lacking representative associations that may strengthen them – conform to the inadequate job supply for present and future teachers, inside and outside the courses that prepare them.

One must remember, as a comparison, the situation of careers counting on strong professional associations: Medicine – the Federal and the Regional Councils of Medicine; Law – the Brazilian Bar Association; Engineering – the Federal and Regional Councils of Engineering; Management – the Federal and Regional Councils of Management. These associations may strengthen their careers at institutional, salary, symbolic, political and market levels. Besides, courses in these areas may open, close or expand according to what these entities express, what guarantees restricted access to the profession. For example, according to decree 5773/2006, the creation of courses of Law or those of Medicine, Dentistry and Psychology must be submitted to the Federal Council of the Brazilian Bar Association or the National Council of Health. Accreditation and accreditation renewals, according to the same decree, imply not only the considerations of these associations, but, under article 37: "in the case of a course corresponding to a regulated profession, the Secretariat will establish a limit of 60 days for the profession regulation organ, of national scope, if willing, to offer data for the Ministry of Education's decision. Meanwhile, however much active teacher unions are, there is no equivalent action or existing legal basis in our country.

We must consider another aspect of the problem, concerning the interior of institutions. Could we think of an environment, opposite to the professional-corporate and business scenario, in which the several courses integrated, in equal conditions, inside university? Unfortunately we do not, and for a historical reason.

Quoting Anísio Teixeira (UFRJ, 2007), "because schools were created as isolated institutions of professional education, they tend to keep, even when integrated at university, their loyalty towards the school, not towards university" (p. 12). Then, a poor sense of solidarity among courses is fostered. Inversely, competition for resources and benefits, and no common identity, seem to be the historical mark of Brazilian universities. In this case, the law of the jungle prevails: the more fragile courses are (even the founding courses such as teacher training), the more fragile they will remain inside institutions.

This point of view is shared by Darcy Ribeiro: "from there comes the structure of these universities established as federations and professional schools, not only autonomous for their independence from university, but also, stuck in their isolation, including because of the hostility among them" (Ribeiro, 1975, p. 39). A seriously contradictory aspect is shown: the system does not materialize as **uni**versity, but uses the socially valued image of university. Denying this would mean despising Lessa's serious advice:

> The exercise of self criticism is mandatory; at the same time, the perception of University as a non-Euclidian mirror of the Brazilian society (...) University internalizes, enlarges and sometimes distorts general problems of Brazilian life. The academy reproduces nation's virtues, potentials, blemishes, limitations, idiosyncrasies, and vices. We need to stop saying we are good, misunderstood, and victims of injustice; that our problems come from lack of resources. There is more than a grain of truth here, however we must admit there is no reason for us to be an island of happiness (Lessa, 1999, p. 29).

What seems more serious, in this case, comes as a final question: how much of this inequality is daily nurtured by higher education institutions? How long will the academy hold inside it so deep inequalities of treatment, investment and care among careers?

It is true that these inequalities will not be overcome except by means of **revaluation of the teaching career** at political, symbolic, salary and professional levels.

FINAL CONSIDERATIONS

The investigation concluded that there is an internal hierarchy among careers in Brazil, revealing its effects in symbolic, intra institutional, employment, salary, and corporate terms. This scenario has persisted over time, without the entry of new profiles in teaching careers, traditionally addressed to low-income students. The study also showed how this profile is still regarded as inferior compared to those of other careers; it is necessary to bring value back to teaching careers at political, symbolic, salary and professional levels as a way to break this vicious circle. A question remains: would this picture repeat itself in other countries? What can we learn with them?

312 - Teachers-researchers: Between what they think and what they do

Luiz Sanches Neto[1], Samuel de Souza Neto[2], and Mauro Betti[3]

UNESP – Univ Estadual Paulista, São Paulo, Brazil
luizitosanches@yahoo.com[1], samuelsn@rc.unesp.br[2], mbetti@fc.unesp.br[3]

Abstract: Regardless of the educational policies of each country, there are good teachers in every continent. There are reports of successful practices in various countries and viable means to share experiences among teachers, although there might be problems in each educational system. However, the qualitative improvement of professional work in Education seems to go further when there are collective actions by the teachers. Public policies can encourage such actions, but it depends on teachers who in fact understand the idiosyncrasies of their own work. Teachers need to organize themselves in the social-cultural context dynamics in which they work and thereby continuously develop their professional competence. Thus, the most common challenges for teachers are breaking the individualism of their own actions and collectively enhance the conditions of professional practice. And if good teachers are breaking the individualism of their actions and working together, the expectation is that the very understanding of their collective work is likely to provide a path for advanced practices. Therefore, the objective of this study is to identify the knowledge produced by teachers who share a collective perspective of pedagogical work, and research their own professional practice. It is an assumption that these teachers research their own everyday problems and treat knowledge as being social. This Doctoral project has been developed with teachers who work with Physical Education (PE) in schools located in São Paulo, Brazil, opting for research in a collaborative manner. This path was chosen considering the history of PE in Brazil that brings out a main problem for teachers: the gap between theory and everyday practices. The expectation is that the qualitative methodological procedures of humanities approach both teachers and researchers as subjects who perceive themselves as peers, as Education workers. As a result, it would be necessary to value the concrete actions of teachers and to assert their professionalism. The methods in this field would be the ethnographic studies and collaborative research. It also deserves note the studies based on the reflective teacher or teacher-researcher concepts. It is considered that the comprehension of pedagogical practice could be enhanced with the research being conducted with the teachers. The themes addressed in this study relies on such a possibility, which would be the own teachers, who work effectively in school Education, conduct research collaboratively as subjects and partners. Thus, the focus of this research lies in the social knowledge recognized as valid for teachers in their own permanent process of professional development. Towards that direction, the purpose is to understand, investigate, and identify how these teachers work daily to produce their own knowledge and organize the curricular principles that underlie their practices. The procedures involve interview with focus groups, observation bound to teachers' know-how, as well as consultation to documental sources (material production) and content analysis of the collected data.
Key-words: Teachers' development; Teachers' work; Professional knowledge; Physical Education

THE CONTEXT OF INVESTIGATION

Regardless of the educational policies of each country, there are good teachers in every continent. There are reports of successful practices in various countries and viable means to share experiences among teachers, although there might be problems in each educational system. However, the qualitative improvement of professional work in Education seems to go further when there are collective actions by the teachers. Public policies can encourage such actions, but it depends on teachers who in fact understand the idiosyncrasies of their own work. Teachers need to organize themselves in the social-cultural context dynamics in which they work and thereby continuously develop their professional competence.

Advances could occur with the valuation of qualified research through methodological rigor and conducted by the school teachers about their pedagogical practice, beyond the strictly academic sense given to the term "teacher-researcher." In the academic sense, only the professor/researcher would qualify him/herself as "teacher-researcher" (Geraldi, Fiorentini, & Pereira, 1998).

The themes addressed in this research relates precisely with this possibility, which would be the own teachers, who works effectively in school education, conduct research collaboratively with methodological rigor and about their teaching. Thus, the focus of research lies in the knowledge valid for teachers in their own permanent educational process.

Specifically, the research takes place within the collective effort of a group of teachers in the area of Physical Education (PE). Hence, the centrality of this research is the analysis of the pedagogical work of such group.

For the development of the research problem, the initial question of this Doctoral thesis project is: What worries a PE teacher? Overall, the provisional answer is that a good teacher worries about being an even better teacher in order to do their work every time better.

Then, what it means to be a "good teacher" and "do the work better" with PE? And how this work could be improved? In Cunha's (1989) relevant research some characteristics attributed to good teachers are detailed in categories, although the author point out that the idea of "good teacher" is variable and descriptive data from her research did not enable generalizations:

- History of life: implies the recognition of one teacher's own life story, especially as a student, and critical analysis of his/her relationship with former teachers, in order to repeat conducts taken as positive and to refute the negative;
- Knowledge of teaching: it refers to knowledge that build on their own experience as teachers, and the possibility of learning from colleagues, with students and through reflection on their work;
- Teacher education: it is a differential form with respect to curricular principles and axiology. The more answers the pedagogic preparation provide to the needs of teachers when they realize it, the more they value it;
- Social practice: it indicates the clarity of wider political dimension of their own teaching, seen as the path chosen to achieve social change;
- Modeling of conduct: focuses on highly competent professionals in the intervention area, so it appears that there would be a tendency to repeat practices of people who teachers admire;
- Insight into the socio-cultural reality and work in school education: the ability to analyze the Brazilian reality, linking it to the model of schooling in the country, and comprehensive analysis of educational issues in the Brazilian social context.

The starting point for the notion of project, the author notes, would be the idea that teachers are choosing alternatives for life, as they reported what was happening in their daily lives, in a deliberate attempt to give meaning and coherence to the fragmented social and educational experiences. When we consider that the educational institution, with its collective project, permeates the work of teachers, Cunha (1989) realized that the teacher's project was stronger than the institutional, with its values, traits and expressions.

So there would be a risk, although it represents freedom and autonomy of teachers, on the other hand can be detrimental because it may mean a total reliance on the teacher's individuality and their level of commitment and competence.

Recently, during a conference focusing on autobiographical research procedures, Cunha (2010) mentioned that the categories were organized into what students thought about the teachers, i.e., the students determined "who were the good teachers." On that occasion, Cunha said it would be worthwhile to investigate how good teachers work specifically in today's education. The question would remain the same: How do the "good teachers" work?

And in the perspective that the consistency of school work is done in collective terms, according to Resende (2010), a "good teacher" has to be sure to share his/her lessons with colleagues.

So, we sought to answer the same question collectively with other teachers who worked in different schools and with whom I shared similar expectations about the consistency of teaching practice. In 2005, after telephone contacts, by e-mail, and informal conversations, we decided to meet to talk, reflect and start the possibility of systematizing our actions on a collective basis.

That was the beginning of what would become the focus of the collective work of research from the problems of daily practice by the group called "teachers-researchers". Teachers participating in the group, since then, share the purpose of researching their own practice more accurately, with the intention of enhancing the comprehension about everyday problems treated in teaching and the broader dynamics of pedagogical work.

This path has apparently been validated by teachers in developing their own knowledge and matches the evidence recommended in contemporary educational theories, i.e, it seems that teachers have been doing what the theory indicates as coherent. The bibliographical production of the group is partially supported by reports of their own experiences in scientific events. However, teachers noticed the need for greater methodological rigor in their intellectual productions, since they remind the accuracy of their own school work.

My experience with the group of "teachers-researchers" was deepened during this period, once I found peers to talk without having an academic affiliation restricted to the assumptions of any institutionalized research

group. Like me, other teachers of the group sought to find issues that affect their teaching since the initial preparation, or were raised from these concrete practices, continuing what had been treated in academic preparation for teaching.

Therefore, it seems that we agree with Resende (2010), asserting that it is probably necessary to have continuous preparation. The agreement goes even further, because to the author, teachers must understand that the return to the initial knowledge which is the basis of their preparation must be *permanent*. There is no possibility of being a competent teacher, or a "good teacher", if the person is not predisposed to have his/her own knowledge under test.

Although admittedly Resende does not have references about the Brazilian context, his notes seem to assign importance to teachers who seek validation of their collective work. Also in other countries in Latin America, would be allocated to certain naivety "insistence" of these teachers to share their practices and qualifying, for the pedagogical work in adversity occurs frequently and would be related to ongoing changes in the workplace, according to Celman (1999).

But what about teachers who understand the context of adversity and remain searching for the collective work? Minimally, these teachers further qualify their actions because they realize they need to understand the context of the school they are working, as pointed out by Freire (1996). The need to break this kind of "vicious cycle" for the education of teachers and in their intervention with PE was clarified by Crum (1993).

Other issues could be taken: Why questioning the teaching work today? What is the logic of teaching work that prevents its consistency in terms of collective? Or, secondly, Why recommending that the work at school based on the collective may be more consistent, rigorous or critical? Perhaps these questions can be clarified in addressing this distinguished group of teachers.

So what can be seen with the group of "teachers-researchers" over five years of activity, with respect to the relevance of the actions that were undertaken since 2005? What are the signs of the collective or collaborative pedagogical intervention present in this format of independent research group, which will propose other ways of articulating the collective work in Basic Education? Or more specifically, to propose ways to systematize the work as teacher-researcher in school PE?

Moreover, in recent decades, it was noticed a distinct concern with the teaching practice in Brazil, especially with regard to how teachers organize and systematize their pedagogical daily work. This concern can be linked to the current demands of the teaching profession and even the quality of educational processes in schooling.

Studies that investigate the characteristics of teachers-researchers in the sense of an epistemology of teaching practice (Geraldi, Fiorentini, & Pereira, 1998) or that are in the course of an ethnography of teaching practice (Borges, 2005) are depicting this concern. Foreign authors as Fenstermacher and Sanger (1998), dealing with the philosophy of education, seem to worry about the relationship between the epistemological field and the idiosyncrasies of teaching practice, proposing four categories for shared analysis of the teachers' pedagogical work: judicial, probation, experiential and situational.

In the judicative category, teachers assume the premises of value in associating their actions or intentions to act with respect to human development. They treat it as a duty statement or declaratively in the form of principles, according to Fenstermacher and Richardson (1994).

The same authors refer to the explanations from teachers about their work based in learning theories, as the conditional premise of practical argument. And when teachers seek to verify them in reality in which they work, the authors indicate that is an experiential or empirical premise, because in this direction the teachers use scientific methods for investigation.

Fenstermacher and Richardson (1994) also show that the arguments of the teachers about their own work may take the form of a situational premise, when examining their actions within the context in which they occur. However, the authors indicate that it is irrelevant to the debate on the concrete conditions of work set to conclude the practical argument is an action or an intention to act as they say the main focus of research on teachers' work should be about forwarding action.

It is advocated that teachers are responsible for their own practice, need to establish and understand the needs of the contemporary world, must be concerned with the establishment of collaborative partnerships, to demand better wages and working conditions appropriate to the functions performed, not counting the essential reason for their work in school: education. Works that show the limits and contradictions of the process of professionalization of teaching are alluding to this observation, such as Veiga and Cunha (1999).

However, it is clear also that the academic discourses transmitted by Higher Education institutions, evidenced by publications on the subject in books and periodicals (FACCI, 2004), while they criticize the teacher's know-how working in basic education, care little to know why teachers working in the school environment "work the way they work," or "teach the way they teach."

Why is there little research on the effective practice of teachers in the daily work in basic education? This questioning was done by André (2005) to defend the relevance of case studies and methodological procedures for the investigation of teaching practice. Note that the "teacher-researchers'" methodological approach that sought to register and talk about their practices, categorizing them to research them so together (Venâncio *et al.*, 2010a).

Is there lack of understanding of the dynamics, complexity and unique and diverse realities that characterize the teaching profession? As questioning by Franco (2008): What is behind the logic of preparation that involves the logic of practices? To what extent the realities of teacher education overlap, and how the discursive reality of Higher Education influence or undermines the deepening of understanding of the pragmatic reality of Basic Education?

There is a need to discover, identify, analyze and interpret how and why PE teachers organize and systematize their work in the school environment. It is understood that toward the realities that are established in everyday, something about this know-how must be interpreted, not to inconsistent, abstract, and lacking in methodological rigor generalizations, but rather to point out possibilities for criticism from concrete realities.

INVESTIGATIVE PROBLEM

Thus, the most common challenges for teachers are breaking the individualism of their own actions and collectively enhance the conditions of professional practice. And if good teachers are breaking the individualism of their actions and working together, the expectation is that the very understanding of their collective work is likely to provide a path for advanced practices.

In this research project, then, the concern is to attend to the collective process of development by an experienced group of teachers, which is intrinsically linked to the pedagogical work of each "teacher-researcher" and that is performed autonomously. Therefore, investigation is supported by methodological assumptions of collaborative research.

The problem is to investigate how the "teachers-researchers" organize and systematize their work in pedagogical practice, with criteria for validation of their collective knowledge and teaching conducts. It is investigating how these teachers think about their daily work and make it based on contemporary educational theories that already point out to what is consistent for practicing of "good teachers".

The focus is therefore on the collaboration established with each teacher and dealing with his/her daily problems to research his/her own practice. It is noteworthy that it is not a search of the researcher to foster any kind of research desire on the teacher who is working in basic education, but as the researcher can work with teachers who apparently already do it for themselves and require a deeper exploration of methodological rigor in their research.

The deal is that the researcher is also interested in increasing rigor in its own research and collaborative research takes on a dialogical sense of readiness for dialogue as proposed by Freire (1996). It is the collaboration between concrete subjects that share common assumptions about the relevance of PE at school and who are worried about closer relationships or minimize the distance between the university and the everyday routines of basic education.

GENERAL OBJECTIVE OF THE INVESTIGATION

It is intended to contribute for research on teachers' work in the field of PE. In Brazil there are few studies that focus it, according to a survey of dissertations and theses held by Duarte (2010), covering the period between 1987 and 2007. The author located less than five monographs on this topic from a total of 467 academic papers.

The work of teachers is complex and its focus is on teaching rigorously specific contents to schooling. To improve their work, especially the quality of education, teachers themselves need to find the central elements of their teaching, which includes the specific knowledge of teaching principles and systematization of curriculum for teaching and school learning.

With this premise, the "teachers-researchers" looked for more rigorous analysis of their teaching. Initially they made it in the light of the methodology of action-research in education (Pimenta, 2005), seeking steps to link their teaching situations in PE (Betti, 2009).

The possibilities of action-research were discussed in the group, in order to explain and interpret how the "teachers-researchers" organized and systematized curriculum principles in their work with PE. As the issues raised by teachers were varied, the method of action-research led to progress in order to reveal their assumptions about teaching, with common aspects and outliers (Venâncio *et al.*, 2010b).

This twist from the action-research prompted the update of the issue treated by the group, extending it to the collective analysis on other parameters. There was also the linking of several teachers to Graduate programs since the beginning of activities.

SPECIFIC OBJECTIVE OF THE INVESTIGATION

Therefore, the objective of this study is to identify the knowledge produced by teachers who share a collective perspective of pedagogical work, and research their own professional practice. It is an assumption that these teachers research their own everyday problems and treat knowledge as being social.

It is to describe and interpret the knowledge produced by teachers researching their own teaching practice. Therefore, it aims to investigate how these teachers work daily to produce their own knowledge and principles to organize the curriculum.

It is questionable as well: How do the "teachers-researchers" systematize their work? How they work daily in teaching and research?

INVESTIGATIVE METHOD AND RESEARCH PROCEDURES

This Doctoral project has been developed with teachers who work with PE in schools located in São Paulo, Brazil, opting for research in a collaborative manner. This path was chosen considering the history of PE in Brazil that brings out a main problem for teachers: the gap between theory and everyday practices.

The expectation is that the qualitative methodological procedures of humanities approach both teachers and researchers as subjects who perceive themselves as peers, as Education workers. As a result, it would be necessary to value the concrete actions of teachers and to assert their professionalism.

The methods in this field would be the ethnographic studies and collaborative research. It also deserves note the studies based on the reflective teacher or teacher-researcher concepts. It is considered that the comprehension of pedagogical practice could be enhanced with the research being conducted with the teachers.

The themes addressed in this study relies on such a possibility, which would be the own teachers, who work effectively in school Education, conduct research collaboratively as subjects and partners. Thus, the focus of this research lies in the social knowledge recognized as valid for teachers in their own permanent process of professional development.

Towards that direction, the purpose is to understand, investigate, and identify how these teachers work daily to produce their own knowledge and organize the curricular principles that underlie their practices.

The procedures involve interview with focus groups, observation bound to teachers' know-how, as well as consultation to documental sources (material production) and content analysis of the collected data.

As a methodological way we chose the qualitative research, collaborative, choosing as techniques: semi-structured interviews, focus groups, documentary sources, observation and content analysis.

According to Tardif (2002) and Contreras Domingo (2001) there are two essential aspects that involve the investigation of teachers' work. In addition to teaching knowledge, Tardif proposes an epistemology of practice, among other themes central to the study of knowledge of teachers.

While Contreras Domingo points to the issue of professional teaching, critiquing the ideology of professionalism and indicating a counterpoint to the sense of unrestricted exploitation of professional practice. These two theoretical categories, taken together, are providing subsidies to understand and analyze the work of "teachers-researchers."

On the notion of epistemology in the teaching knowledge, Fenstermacher (1994) explains that it is peculiar the growth of scientific literature on the knowledge that teachers produce as a result of their work, contrasting with the knowledge produced by specialists on educational research about teaching.

For the author, the research focus should be placed on the epistemological aspects of knowledge production and the expansion of teacher knowledge about teaching, involving itself in the genesis of knowledge about teaching.

The mentioned authors situate their research in the educational context and fall within the more extended field of qualitative research. Similarly, this project seeks to sustain itself with the design of a qualitative educational research.

But the collaborative character of this investigation is effective in the sense of linking the production of knowledge of teachers through the ongoing dialogue between those involved, including the "teacher-researcher" author of the research project and the "teachers-researchers" as participants in this research.

From the studies coordinated by Pimenta (2008), some issues justify theoretical development in the area of teacher education, and serve to delimit this research:

- The importance of research to be done in concrete situations, verifying its possibilities and limitations in school contexts;
- The paths from action-research to collaborative research;
- The epistemology of practice and the processes of building knowledge of the teacher;
- The knowledge and the identity of the teacher, with professionalism as a field of research;
- The possibilities and limitations of the conception of "reflective teacher", analyzing the indiscriminate use of this perspective in the literature;
- The controversy from the perspective of "teacher-researcher", investigating the implications in the design of reflective teacher to critical intellectual.

The research procedures involve structured and semi-structured interviews, written transcripts of audio recordings and video productions, and autobiographical records produced by the "teachers-researchers" such as : lesson planning issues within the workplace and in format of teaching laboratory shared with the group, outlines of planning and projects for professional teaching career, reflections on the history of life and profession, notes and minutes of regular meetings, papers and other literature production compiled since 2005.

The data also include files and messages logged in a website. The page was created in 2006 and monthly more than one hundred (100) messages on average are shared among teachers in the group, now totaling more than two hundred (200) "teacher-researchers".

There are records of teachers working in all five Brazilian regions, including some teachers from other areas, although the page is originally directed at teachers of PE.

Predominantly, most teachers are working in the metropolitan region of São Paulo – the area of "Greater São Paulo", near the State capital, including the surrounding municipalities – both at public and private schools attending from Kindergarten to High School, and that some teachers also accumulate teaching in Higher Education.

Besides the interaction from distance, some teachers also meet monthly in public spaces in São Paulo, and occasionally for scientific and cultural events in Brazil and other countries.

Thus, the sample was selected intentionally and effective participation of each teacher will be made upon informed consent. For research groups will be formed with equal amount of participants, constituting a kind of control to compare the data obtained.

Twelve (12) teachers were invited because they have participated in monthly meetings, characterized as "teachers-researchers" with the condition to share experiences among themselves on a collective basis for at least two years. The focus is to examine how these teachers work and how they deal with specific problems to systematize their work.

We also intend to examine other variables that may influence the production of systematic knowledge about the curriculum, such as aspects of initial preparation and several attributes that imply in the pedagogical work due to contact with institutionalized groups of academic research and Graduate programs.

Data will be confronted by the procedures of "triangulation" with random selection (with "double blind" procedure) of half of the sample (six teachers) for detailed analysis of their pedagogical work and an interview about the findings of the analysis, sharing comments. The other half of the sample (six other teachers) will be up to read the main findings and conclusions (after incorporating the interviews), being held a later interview with them too. Following with the work, points of view of these teachers will be incorporated in the conclusions.

The initial script for the interview has three axes for analysis, with an instrument adapted from Correia and Ferraz (2010): description of the pedagogical work, interpretation of the pedagogical work, and proposition (authorship) of the pedagogical work. Thus, it is intended that the descriptive and interpretive analysis is contextualized with the propositions of each teacher, and so shared in dialogue.

The main issues of the three axes, respectively, refer to the centrality of the theme: How teachers work? How to face everyday problems that could compromise the quality of your work? How to research issues related to their work and whether they are able to improve it through such research?

And, looking to the perspective of teachers' collective work, especially one question must be asked: Whether the involvement with a group of "teachers-researchers" does have some impact on their pedagogical work?

According to Contreras Domingo (1994), we should bear in mind that if a problem is defined in the practical field of action, insofar as we intend to improve our practice, this problem has to do with *what we do ourselves*. Understand a situation in which we intervened requires understanding the way in which we intervene, and what it implies and means for the subjects involved in this action.

Beyond the need to share experiences on practical issues, the arguments of Mizukami *et al.* (2006) appears to be consistent in the sense that the learning of teaching has methodological specificities that need to be

elucidated in the process of collaborative research. For the authors, the collaborative work carried out in collective contexts at school and outside of them, as is the case of this research, both require validation and support of the teachers themselves as participants.

In this sense, Araújo and Moura (2008), Franco and Lisita (2008), Oliveira and Anastasiou (2008), Leite (2008), and Oliveira-Formosinho (2008) offer insightful clues to the development of collaborative research, whose procedures are in for this investigation. There is emphasis on the recovery of the narratives of the teachers themselves, the treatment of their autobiographies in a perspective that leads to autonomy.

According to Oliveira e Anastasiou (2008), we seek to enable teachers to research their own educational pathways, tacking meanings and reinterpretations, which can generate changes both in our conceptions and teaching practices. The authors explain that the investigation focused on the history of life lies in a matrix of qualitative research that when faced with the problems in teacher education, helps to clarify them.

With this, they agree with Tardif *et al.* (1991) and criticize the application model in the preparation of teachers. And they invoke Nóvoa (1992) by stating that because it does not separate the personal, professional, and organizational dimensions out from the teaching development, that the methodological work with the autobiographies stands out.

STAGES OF RESEARCH

The research is intended to cover three phases for data organization, inspired by the methodology adopted by Souza Neto (1999) when researching a particular *métier* qualitatively for the preparation of PE teachers. The phases have predominant features: exploratory, focused and interpretive.

The exploratory phase includes the analysis of documentary sources produced by the teachers selected for the study and semi-structured interviews. Chosen topics to mark the semi-structured dialogue refers to the work on the "investigative stance", by Cochran-Smith and Lytle (1999). The script for structured interviews includes theoretical assumptions by Shulman (1986, 1987) and Smyth (1992) on the teachers' *knowledge base* about their own work.

Two central questions constitute that stage of initial diagnosis: What constitutes the professional profile of each "teacher-researcher"? And how each teacher works his/her teaching professionalism? In this context there is the theoretical contributions by Contreras Domingo (2001), Garcia (1999), Fenstermacher and Richardson (1994), and Freire (1996).

Questions allow the following categories, according to (a) Smyth (1992): the forms of action in the reflective process involving the description, information, confrontation, and reconstruction; (b) Shulman (1986, 1987): knowledge of content pedagogical knowledge, self-knowledge, knowledge about the students, curricular issues, the educational context and the educational objectives; (c) Contreras Domingo (2001): the autonomy of teachers; (d) García (1999): the professionalism of teachers; (e) Fenstermacher and Richardson (1994): the form of practical arguments with assumptions of value, conditional, empirical, and situational, (f) Freire (1996): the dialogical sense of pedagogical work.

The focused phase includes the collection of data on a collective basis with the teachers, using the methodological procedures related to the focus groups (Gatti, 2005). Szymanski (2010) highlights the need to point focalizing issues that bring the speech to the desired focus on research and avoid lengthy digressions.

The interpretive phase, in its turn, highlights the criteria for assessing the reliability of research: "staying on the field" and "triangulation of data." Both were used by Souza Neto (1999) in his study, from the parameters proposed by Lüdke and André (1986), and Alves-Mazzotti and Gewandsznajder (1998).

According to the author, staying on the field increases the possibility of accurate inferences, interpretations and conclusions accurate, because there is time to correct false interpretations, review the course of the inferences and reorient the focus of attention (Lüdke & André *apud* Souza Neto, 1999, p.207).

Still, the triangulation generally refers to the comparison of data collected by qualitative and quantitative methods, but it can also refer to the comparison of data from interviews with other sources (Alves-Mazzotti and Gewandsznajder *apud* Souza Neto, 1999, p.208). Thus, to ensure rigor in the interpretation of collected data the cross-analysis of sources and methods will be used.

In summary, the research phases are:

> 1st phase – analysis of documental data, and semi-structured interviews with the twelve (12) participants. After the first interviews will be conducted structured interviews with all participants and organizing groups for the next phase;
>
> 2nd phase – focus groups: it is planned the composition of two (2) groups with six (6) teachers each. The first group teachers examine their own work and findings from the interviews. The second group teachers also do the same kind of analysis, supplemented by the

considerations of the first group. It is expected one observer to attend in each group, according to a common criterion of such methodological strategy.

3rd phase – interviews with the twelve (12) participants and triangulation of data.

PARTICIPANTS

The twelve (12) participating teachers previously agreed to disclose their names and professional connections.

However, only the first names of the teachers will be used to identify them throughout this study as well as the date of his/her registration on the "teachers-researchers" group's website:

André (28 October, 2007), Angela (10 September, 2006), Carla (9 November, 2006 – cofounder of the group), Jéssica (2 January, 2007), Leandro (11 December 2006), Luciana (3 November, 2006 – cofounder of the group), Luciano (11 April, 2007), Marcelo (9 September, 2007), Rosângela (8 July, 2007), Tatiana (9 June, 2007), Tiemi (5 November 2006 – cofounder of the group), and William (11 February, 2007).

PRELIMINARY FINDINGS AND NOTATIONS

So far, the study is in its first phase, consisting of the analysis of data from documentary sources and the organization of interviews with teachers.

The source with the greatest amount of information for analysis seems to be the set of minutes of all meetings of the "teachers-researchers" group with records since 2005. It has already occurred almost one hundred (100) encounters among teachers, considering their monthly meetings and participation in scientific and cultural events.

The following is a *Table* with examples of descriptive analysis of the first three meetings, including date, number of participants, location and summary of activities:

	Date	Summary of Activities
1	28/12/2005 (w/4 teachers)	First contact among teachers and exchange of experiences on lessons at school; the meeting occurred inside a mall in downtown São Paulo, Brazil.
2	4/2/2006 (w/3 teachers)	Exchange of experiences about the school lessons; the meeting occurred in a cultural center in downtown São Paulo.
3	18/2/2006 (w/5 teachers)	Exchange of experiences about the school lessons; opportunities for collective planning of PE classes; beginning of the contents' joint planning; the meeting occurred in a cultural center in downtown São Paulo.

In addition to the meetings, teachers share their records with files and messages on a website. All messages are archived on the page, so consultation is possible for any participants. The following *Table* shows the distribution of communications, containing the number of messages exchanged among the teachers in each month. As updated in April 30th, there are 225 teachers registered on the website (http://br.groups.yahoo.com/group/professorespesquisadores):

	Jan.	Feb.	Mar.	Apr.	May	Jun.	Jul.	Aug.	Sep.	Oct.	Nov.	Dec.
2011	67	65	102	54								
2010	112	166	138	118	77	115	154	137	95	82	61	52
2009	127	99	126	154	181	122	94	97	84	91	94	110
2008	21	12	43	41	116	45	101	93	78	54	56	88
2007	32	46	38	21	37	81	20	45	24	29	17	28
2006											19	40

Since 2008 teachers have agreed between themselves that the circulation of some messages would be restricted, by private e-mail addresses, to protect bibliography of their intellectual property still under

development. This decision reduced the number of messages shared by the page, but established the criterion that only the productions already published would be filed for consultation.

To identify and analyze the teachers' intellectual production, concerning to the possible influence of the group in research on their teaching, bibliographic information has been sought in the academic curriculum (*resumé*) of each participant. Data collection started from each teacher's registration date in the group, and the databases consisted in the *Lattes* Platform of the National Council for Scientific Research (CNPq), covering all Brazilian scholars and researchers. We could note that not all participants have updated information at the platform.

The following *Table* presents indicators for the participants' bibliographical production and the date of the latest update of their academic *resumé* records:

	Events	Presentations	Papers	Chapters/Books
André (Mar. 2010)	1	1	-	-
Angela (Jun. 2003)	-	-	-	-
Carla (Oct. 2010)	25	44	1	1
Jéssica (Jan. 2009)	4	7	-	-
Leandro (Dec. 2010)	20	15	4	-
Luciana (Feb. 2011)	55	45	6	10
Luciano (Dec. 2010)	16	5	-	-
Marcelo (Jan. 2011)	-	1	-	-
Rosângela (Jul. 2010)	2	12	1	2
Tatiana (Apr. 2010)	-	6	-	-
Tiemi (Dec. 2010)	21	30	-	1
Willian (Mar. 2011)	26	15	2	-

Throughout the period in which the group established, teachers have produced different materials depicting their work with PE in Basic Education. Amidst their productions and records there is an emphasis on the (auto)biographies, since the treatment of life history is often pointed as a means of contextualizing each teacher's insights about everyday teaching practices, as well as his/her peers.

The criteria mentioned by teachers in preparing their (auto)biographical records permeate family, school, academic, labor relationships, and socio-cultural linkages. Apparently there is emphasis on the connection between life history and each teacher's project for his/her teaching career (Sanches Neto & Venâncio, 2010).

About the script and questionnaire for initial interviews, and organizing focus groups there are the following provisional routing:

In the first interview, with semi-structured character, dialogue is expected to occur as an agenda based on five axes highlighted in the work of Cochran-Smith and Lytle (1999): (a) relations between knowledge and practice; (b) images of what is the knowledge; (c) images of teachers, teaching, and professional practice; (d) images of teaching learning and teachers' functions in educational change; and (e) current initiatives in teacher education, professional development and/or teacher assessment. The intention is to talk with teachers, sharing at least one of their lesson plans according to their own choice and any materials selected by them, which are alluding to their pedagogical work, such as records of images in photographs and/or videos.

In the following structured interview, we intend to use a questionnaire based on proposals from researchers who excel in dealing with theories about the teacher's knowledge. From the data of the previous interview, the intention is to analyze in detail the lesson plan selected along with each teacher, as well as remarks about any other material discussed in the first meeting.

After this period, we intend to establish two focus groups among participating teachers, so that both groups could discuss their own pedagogical work, and the second group would also review the considerations elaborated by the first. Possibly, two observers are going to be asked to collaborate in the study at that stage.

Finally, the third interview has the purpose of reviewing all the work in the perspective of sharing the considerations of each teacher and to assess the reliability of the data.

Abstract: Our aim in this poster was to analyse the application of new educational practices in the subject of Classroom Organisation in Early Childhood Education 0-6 years in the Infant School Teacher Degree at the University of Alicante (UA).

We live in a society where it has become essential to know how to use the information and communication technologies in teachers' life (Barab y Roth, 2006), and there is especially a need for team work to play a relevant role developing collaboration processes in physical as well as virtual environments that can boost the social construction of knowledge (Martínez, Lozano & Sauleda, 2008).

This methodological innovation experience took place during the first semester of the 2010/2011 academic year in the subject Classroom Organisation in Early Childhood Education 0-6 years, imparted in the first year of the Infant Education Teacher Degree at the University of Alicante (Spain), with a group of 98 students (only 5 males). Seeking to fulfil the objectives proposed in the subject syllabus, a number of activities were designed which had in common collaborative work and Problem-based project (PBP) along with the utilisation of communication technologies, communication and productivity tools and the so-called Web 2.0. The main objective was to undertake a project that would lead to the creation of a School Kindergarten at the University of Alicante. Groups of 4 people were formed for the project execution, each group being given computers so that they could work in the physical (classroom) practical sessions. In addition to the classical office automation applications, the main tools used on the Internet have been Wordpress.org and google.doc, along with social networks. Each group had to develop a project (about the School Kindergarten) using google.doc. The document was shared and prepared online by the group members. The teacher could leave comments about the evolution of work in a formative evaluation at all times.

At the end of the year, the students enrolled in this subject completed an anonymous, voluntary questionnaire (thirty closed and four open-ended questions, by google.doc) that included items about collaborative work and about their perception of learning in the project and PBP methodology. The questionnaire was completed by 63 students.

Summing up, the results show that clear benefits are obtained thanks to collaborative work and also because this is a good methodology for the right development of the project. On the other hand, the results reveal that collaborative work helps achieve a better and deeper learning of subject contents. We equally observe that the relationships between all these members are mostly excellent (32.37%, Agree). However, the overall assessment of this experience is highly negative regarding collaborative work and the utilisation of social networks and communication technologies (31.75%, Indifferent) and students prefer working physically (66.67%, Strongly Agree) rather than virtually (11.11%, Strongly Agree).

Keywords: digital literacy, ICTs, teacher training.

INTRODUCTION

The European university's mission is to provide education so that the future citizens can acquire the ability to build social networks, connected thanks to the existing communication media (wikis, blogs, Twitter, etc.), especially in a moment when social networks are increasing their size and speed as quickly as we press the keys on our computers (Christakis & Fowler, 2010).

Today's citizens must be able to use the new technologies. In this sense, every training initiative addressed to new teachers must create opportunities to keep alive in each person the desire to rise into the virtual cosmos and help them assimilate the importance that the phenomenon of digital social networks has in our present and our future.

If we want to understand how society functions, we need to recover the links lost between individuals. We need to understand in what way the interconnections and interactions between

people give rise to totally new aspects of human nature which are not present in an individual. If we do not understand social networks, there is no hope for us to fully understand how we are and how the world we inhabit is (Christakis & Fowler, 2010, p. 45).

In this respect, Carol Lee (2009) argues that there are multiple ways towards learning. In tune with Moss (Moss *et al.*, 2009), we would particularly like to stress that it is ethically very appropriate to revise also the paradigm which opposes the one we assume. In short, we believe that a strong emphasis must now be placed on proposals similar to the one formulated by Barab & Roth (2006), which stresses the importance of social networks.

In general terms, we agree with Putnam & Borko (2000) that teachers' learning and methodology change must be based on some of the aspects present in their teaching practice. For instance, in one of the following environments:

- ✓ In their own classrooms where new strategies can be developed.
- ✓ In collective spaces where participants' practice is at the heart of the discussion.
- ✓ And in a combination of both orientations situated in a variety of contexts, which tends to become a very appropriate way to promote multidimensional reshaping processes in teachers' thinking and practice.

The interpretation offered by Carol Lee (2009) encourages us to assume an emergent consensus regarding the plurality of ways that lead to knowledge (emotional dimension, cognitive dimension and relevance; social relationships; technological resources, etc.). Below can be found the dimensions we are referring to:

- ✓ The socio-emotional dimension: the way to knowledge may include the matters related to social knowledge, as well as the emotional knowledge that refers to knowledge about the social systems where young people have to coexist and operate.
- ✓ The cognitive dimension: the literature has distinguished between conceptual and declarative knowledge, procedural knowledge, generative knowledge (linked to the 'learning-to-learn' competence and as investigating knowledge), the knowledge of problem resolution, knowledge by mimetisation, environmental knowledge (based on the situation or on the learning context) and critical knowledge (based on critical assessments).
- ✓ The relational dimension: social networks, tutorial relationship, academic relationship (teacher-students-teacher) or informal relationships (typical of the university institution, for example, a university hall of residence).
- ✓ The resources dimension: the relevance of artefacts or devices that can help build knowledge such as, for instance, the new technologies, the Internet, etc., or those resources which are community-based.

In the cognitive domain (Perkins, cited by Lee, 2009) there are many approaches to reasoning depending on the methodologies applied in each one of the disciplines; in mathematical science, methodologies based on problem resolution are developed; in the context of sciences, research and large databases; and in historical science, the critical assessment of the past history becomes essential.

Anyway, McAfee (2009), in his work Enterprise 2.0, has highlighted the new work culture based on new forms of collaboration made possible by information technology (wikis, blogs, Twitter, etc.). It all has generated a diversity of problems with the creation and operation dynamics of social networks (Martínez, Lozano & Sauleda, 2008).

OBJECTIVES, METHODOLOGY AND PARTICIPANTS

The objectives we set ourselves were the following:

1. To identify and analyse the benefits and difficulties associated with project-based collaborative learning.
2. To analyse and assess physical and online collaborative work.
3. To detect formative needs regarding online collaborative work.
4. To identify the use of digital tools in collaborative work, as well as the electronic sources of information in project-based learning.
5. To detect the strengths and weaknesses in the development of the project-based methodology among university studies in the Teacher Degree.

In order to achieve the objectives sought, we suggested the design of a working project for the creation of a School Kindergarten [Infant Education School] for the University of Alicante staff. It must be highlighted that the UA does not have a School Kindergarten at the moment, which is why students had to design a school with characteristics corresponding to the UA context. On the other hand, the project had in common

collaborative work (with groups of 4 or 5 people) and the utilisation of communication technologies, communication and productivity tools and the so-called Web 2.0. Emphasis was laid on the use of digital tools, especially social networks (google.doc in particular), since the time available for physical (in-class) sessions was very limited (100 minutes per week) and, therefore, they demanded both collaborative work and the discussion of the objectives achieved. Finally, the groups presented their projects before the large group. The assessment of this experience was carried out using an anonymous questionnaire with 30 closed questions based on physical and online collaborative work. Each one of the items included five Likert-scale-type answers (1-Totally Disagree; 2-Disagree; 3-Indifferent; 4- Agree; and 5-Strongly Disagree). Four open questions about the methodology developed were posed at the end of the questionnaire which assessed the improvement of learning through this methodology along with its positive and negative aspects. The questionnaire was completed through google.doc when the teaching of the subject under study came to an end.

This methodological innovation experience took place during the first semester of the 2010/2011 academic year in the subject Classroom Organisation in Early Childhood Education 0-6 years, imparted in first year of the Infant Education Teacher Degree at the University of Alicante (Spain), with a group of 98 students (95% of whom were women, and only 5% men) distributed across 24 groups of 4 people (there were only two groups with 5 members). The questionnaire was completed by a total of 63 students (94% women and 6% men).

RESULTS

This poster shows the partial results of this study. Firstly, we present those referred to the assessment of the benefits and difficulties associated with collaborative work in the project-based methodology, which contains the students' perceptions about this methodology and collaborative work analysed from a qualitative perspective, the results of which are shown in absolute frequency percentages (Figures 1 and 2). Secondly, we present the partial results referred to the closed questionnaire analysed from a quantitative point of view, the results of which are shown in percentages depending on the items answered (Figures 3, 4 and 5).
Figure 1. Benefits of collaborative work- PBP methodology.

We can observe that the project-based methodology consolidates the knowledge developed in the subject (40.29%). Furthermore, it not only boosts interactions between group members (32.37%) but also enlarges knowledge. On the other hand, it is worth highlighting that the findings permit to verify that this type of methodology encourages search for information (16.55%) and improves knowledge and professional competences in the degree under analysis (10.79%). In short, the results show that students consider this methodology beneficial to the understanding and assimilation of subject contents.
Figure 2. Difficulties in collaborative work-PBP methodology

Seeking to improve this educational proposal, we asked students to reflect on the potential difficulties or obstacles that they detect in the development of this methodology. The results with the highest frequencies (see Figure 2) highlight time (39.86%) for activity development and, especially at physical meetings, for the discussion of the objectives reached and the establishment of new tasks; absence of coordination among group members (35.51%); and finally, lack of consensus among group members regarding the different opinions expressed (24.64%). In short, the results reveal difficulties in the relationship with the other members, especially regarding consensus on the specific tasks that need to be performed.

On the other hand, we have included a questionnaire with closed questions for the purpose of analysing the presence of digital tools both in collaborative work and in the development of the project-based methodology. The results offer three distinct codes.
Figure 3. Physical collaborative work

We can see that this code is formed by five sub-codes: 2.1. Roles established; 2.2 Most significant collaboration; 2.3 Effectiveness in communication; 2.4 Effectiveness in planning and organisation; 2.5 Agreements on project content and presentation. Students mostly agree that work in the classroom is very

484

significant when it comes to work collaboratively. It also becomes evident that there is a high level of agreement on the five codes mentioned, exceeding 60% in most cases, with the exception of sub-codes 2.2 and 2.5. We detect that the result corresponding to agreements on project content and presentation is not very high. This might be due to the fact that they used google.doc for their presentation.
Figure 4. Virtual collaborative work

Figure 4 contains the following sub-codes linked to the use of digital networks: 3.1. Roles established; 3.2 Most significant collaboration; 3.3 Effectiveness in communication; 3.4 Effectiveness in planning and organisation; 3.5 Agreements on project content and presentation.

The results tell us that students prefer establishing roles in a non-virtual way (49.21%). They tend to be indifferent to the use of digital tools and the development of online instruments in collaborative work. Thus, we observe that students apparently do not mind if communication is more or less effective (31.75%) and are also uninterested in the planning and organisation of the work that has to be developed (31.75%) and, besides, they do not mind either if collaboration is more or less significant (23.81%) or if the conditions are ideal for the presentation of the contents prepared (26.98%).
Figure 5. Physical or virtual collaborative work

As a final result, we must highlight that students prefer working physically (66.67% of them Strongly Agree) as opposed to 11.11% of students who express their wish to work virtually.

CONCLUSIONS

The results obtained demonstrate that the digital socialisation function clearly prevails over the professional one. As a matter of fact, the evidence attests that there is not a real virtual collaborative virtual among university students (they prefer working physically). In short, it becomes urgent to establish a collaborative culture among students articulated around social networks and work teams, as this will most probably generate effective results in their future teaching practice (Putnam & Borko, 2000).

All in all, we are still far from regarding communication technologies as a natural element in teaching-learning activities. This experience confirms that it is still difficult to integrate them within a virtual institutional environment. However, the overall assessment of this experience is highly positive, both in terms of students' academic results and regarding the degree of satisfaction among those students and among their teachers as well. However, we want to insist on the fact that there is still a propensity to refer to ICTs focusing our attention on technological development and their possibilities of expansion as an educational offer; however, scholars hardly ever analyse the social transformation potential that these technologies entail, as has been highlighted in similar experiences (Fourcade *et al.,* 2009).

338 - How Do We Define and Evaluate Preschool Quality? Swedish Preschool Teachers in a Discoursive Crossfire

Charlotte Tullgren[1], Lena Bäckström[2], and Marie-Louise Österlind[3]

Kristianstad University, Sweden
[1]charlotte.tullgren@hkr.se, [2]Lena.backstrom@hkr.se, [3]Marie-louise.osterlind@hkr.se

Abstract: Swedish preschools are welfare institutions required to achieve and demonstrate high quality. The preschool teachers are responsible not only for the quality of the daily activities at the preschool, but also for the evaluation and development of these activities. The latter can be problematic especially in times of diminishing financial resources. This raises question on how quality is defined and evaluated.

An analysis of the national and local steering documents showed two coexisting discourses concerning quality and quality work in preschools: I) a *relational discourse* within which quality was closely related to relations and reflections, and II) a *new public management (NPM) discourse* within which quality was related to measurability and effectiveness.

The here presented study aimed to explore discursive expressions of quality and quality work among preschool teachers. The methodological frame of reference was inspired by critical discourse analysis, which enables the study of discourses and their relations to socio cultural practices, hereby allowing a critical perspective on society. Data was collected during a seminar where 38 preschool teachers discussed the themes: 1) What is quality in preschool? 2) How/where/when does quality become visible? 3) How can quality be achieved? 4) How can quality be evaluated?
