Abstract. It is evident, that the properties of monogenic polynomials in (n + 1)-real variables significantly depend on the generators e_1, e_2, \ldots, e_n of the underlying 2^n -dimensional Clifford algebra $C\ell_{0,n}$ over \mathbb{R} and their interactions under multiplication. The case of n = 3 is studied through the consideration of Pascal's tetrahedron with hypercomplex entries as special case of the general Pascal simplex for arbitrary n, which represents a useful geometric arrangement of all possible products. The different layers \mathscr{L}_k of Pascal's tetrahedron (or pyramid) are built by ordered symmetric products contained in the trinomial expansion of $(e_1 + e_2 + e_3)^k$, $k = 0, 1, \ldots$

Keywords: Pascal's tetrahedron, Clifford Analysis **PACS:** 02.30.-f, 02.30.Lt, 02.10.Ox

1. INTRODUCTION

The following formulae (2) and (3) are examples of the role that complex (imaginary) entries can play when used in powers of binomials. Since we have

$$(1+i)^{4l+1} = (1+i)^{4l}(1+i) = (2i)^{2l}(1+i) = (-4)^l(1+i) \ l = 1, 2, \dots,$$
(1)

the binomial expansion of the left side of (1) implies immediately the validity of two binomial identities

$$\binom{4l+1}{0} - \binom{4l+1}{2} + \binom{4l+1}{4} - \dots + \binom{4l+1}{4l} = (-4)^l$$
(2)

and

$$\binom{4l+1}{1} - \binom{4l+1}{3} + \binom{4l+1}{5} - \dots - \binom{4l+1}{4l+1} = (-4)^l \tag{3}$$

after separation of the real and imaginary part.

Working in hypercomplex analysis with *n* different non-commutative imaginary units, the following general question seems natural: What is changing in the ordinary *n*-dimensional arrangement of multinomial coefficients (*Pascal's simplex*) if the real entries are substituted by *n* imaginary units e_1, e_2, \ldots, e_n ?

The fact that the structure of the layer in Pascal's simplex rules the composition of a special set of Appell polynomials in terms of hypercomplex variables was already mentioned in the paper [1]. Due to the relevance of the answer for applications in Clifford analysis, we consider the set $\{e_1, e_2, \ldots, e_n\}$ as being an orthonormal basis of the Euclidean vector space \mathbb{R}^n with a non-commutative product according to the multiplication rules

$$e_k e_l + e_l e_k = -2\delta_{kl}, \ k, l = 1, \dots, n,$$
(4)

where δ_{kl} is the Kronecker symbol. Then the set $\{e_A : A \subseteq \{1, \dots, n\}\}$ with $e_A = e_{h_1}e_{h_2}\dots e_{h_r}$, $1 \le h_1 < \dots < h_r \le n$, $e_{\emptyset} = e_0 = 1$, forms a basis of the 2^n -dimensional Clifford algebra $\mathcal{C}\ell_{0,n}$ over \mathbb{R} . We embed \mathbb{R}^{n+1} in $\mathcal{C}\ell_{0,n}$ by identifying $(x_0, x_1, \dots, x_n) \in \mathbb{R}^{n+1}$ with $x = x_0 + \underline{x} \in \mathscr{A} := \operatorname{span}_{\mathbb{R}}\{1, e_1, \dots, e_n\} \subset \mathcal{C}\ell_{0,n}$. Here $x_0 = \operatorname{Sc}(x)$ and $\underline{x} = \operatorname{Vec}(x) = e_1x_1 + \dots + e_nx_n$ are the so-called scalar resp. vector part of the paravector $x \in \mathscr{A}$. The conjugate of x is given by $\overline{x} = x_0 - \underline{x}$ and its norm by $|x| = (x\overline{x})^{\frac{1}{2}} = (x_0^2 + x_1^2 + \dots + x_n^2)^{\frac{1}{2}}$. Obviously, we can identify the case n = 1 with the complex algebra case by $i := e_1$.

2. PASCAL'S TETRAHEDRON WITH HYPERCOMPLEX ENTRIES

As mentioned in the beginning, the consideration of an arbitrary value of *n* leads to an arrangement of multinomial coefficients following the multinomial expansion theorem. But essential and non trivial effects of the non-commutative multiplication can already be seen in the case of n = 3. The corresponding 3-simplex is the Pascal's tetrahedron (see [2]) with hypercomplex entries. The different layers \mathcal{L}_k of it are built by the elements of the trinomial expansion of $(e_1 + e_2 + e_3)^k$, $k = 0, 1, \ldots$ As example, let us consider the case k = 3, i.e. the construction of the third layer \mathcal{L}_3 . By taking into account non-commutativity the expansion can explicitly be written in the following order:

$$(e_{1}+e_{2}+e_{3})^{3} = e_{1}^{3} + (e_{1}e_{1}e_{2}+e_{1}e_{2}e_{1}+e_{2}e_{1}e_{1}) + (e_{1}e_{1}e_{3}+e_{1}e_{3}e_{1}+e_{3}e_{1}e_{1}) + (e_{1}e_{2}e_{2}+e_{2}e_{1}e_{2}+e_{2}e_{2}e_{1}) + (e_{1}e_{2}e_{2}+e_{2}e_{1}e_{2}+e_{2}e_{2}e_{1}) + (e_{1}e_{2}e_{3}+e_{1}e_{3}e_{2}+e_{2}e_{1}e_{3}+e_{2}e_{3}e_{1}+e_{3}e_{1}e_{2}+e_{3}e_{2}e_{1}) + (e_{1}e_{3}e_{3}+e_{3}e_{1}e_{3}+e_{3}e_{3}e_{1}) + e_{2}^{3} + (e_{2}e_{2}e_{3}+e_{2}e_{3}e_{2}+e_{3}e_{2}e_{2}) + (e_{2}e_{3}e_{3}+e_{3}e_{2}e_{3}+e_{3}e_{3}e_{2}) + e_{3}^{3}.$$
(5)

This expansion corresponds to the case k = 3 in Pascal's tetrahedron for real entries, given in the general form (cf. [2])

$$(a+b+c)^{k} = \sum_{m=0}^{k} \sum_{s=0}^{m} \binom{k}{m} \binom{m}{s} a^{k-m} b^{m-s} c^{s}, \quad a,b,c \in \mathbb{R}.$$
(6)

The corresponding layer \mathcal{L}_3 written in ordered rows as arrangement of the different monomials corresponding to the increasing row-index m^1 has the form²:

$$m = 0 \qquad \qquad \begin{pmatrix} 3 \\ 0 \end{pmatrix} a^{3} m = 1 \qquad \qquad \begin{pmatrix} 3 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} a^{2}b \qquad \qquad \begin{pmatrix} 3 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 1 \end{pmatrix} a^{2}c m = 2 \qquad \qquad \begin{pmatrix} 3 \\ 2 \end{pmatrix} \begin{pmatrix} 2 \\ 0 \end{pmatrix} ab^{2} \qquad \qquad \begin{pmatrix} 3 \\ 2 \end{pmatrix} \begin{pmatrix} 2 \\ 1 \end{pmatrix} abc \qquad \qquad \begin{pmatrix} 3 \\ 2 \end{pmatrix} \begin{pmatrix} 2 \\ 2 \end{pmatrix} ac^{2} m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 0 \end{pmatrix} b^{3} \qquad \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 1 \end{pmatrix} b^{2}c \qquad \qquad \begin{pmatrix} 3 \\ 2 \end{pmatrix} \begin{pmatrix} 2 \\ 1 \end{pmatrix} bc^{2} \qquad \qquad \begin{pmatrix} 3 \\ 2 \end{pmatrix} \begin{pmatrix} 2 \\ 2 \end{pmatrix} ac^{2} (3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 0 \end{pmatrix} b^{3} \qquad \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 1 \end{pmatrix} b^{2}c \qquad \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 2 \end{pmatrix} bc^{2} \qquad \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 2 \end{pmatrix} bc^{2} \qquad \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3} \\m = 3 \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} a^{3} \\m = 3 \end{pmatrix} a^{3}$$

The differences between $(e_1 + e_2 + e_3)^3$ and $(a + b + c)^3$ are obvious and due to the non-commutativity of the hypercomplex imaginary units we cannot obtain (5) by substituting $a = e_1$, $b = e_2$, $c = e_3$ in (6). Nevertheless, it exists a way to describe the trinomial expansion of $(e_1 + e_2 + e_3)^k$ formally in the same way as that of $(a + b + c)^3$. To do so one has to use the following (cf. [3])

Definition 1 (Symmetric Product) Let $V_{+,\cdot}$ be a commutative or non-commutative ring, $a_k \in V$, k = 1, ..., n, then the "×"-product is defined by

$$a_1 \times a_2 \times \dots \times a_n = \frac{1}{n!} \sum_{\pi(s_1, \dots, s_n)} a_{s_1} a_{s_2} \dots a_{s_n}$$

$$\tag{7}$$

where the sum runs over **all** permutations of all (s_1, \ldots, s_n) .

together with the

Convention: If the factor a_i occurs μ_i -times in (7), we briefly write

$$\underbrace{a_1 \times \dots \times a_1}_{\mu_1} \times \dots \times \underbrace{a_n \times \dots \times a_n}_{\mu_n} = a_1^{\mu_1} \times a_2^{\mu_2} \times \dots \times a_n^{\mu_n}$$
(8)

and set parentheses if the powers are understood in the ordinary way.

¹ The index s is increasing in NW-SE diagonal direction, whereas (m-s) increases in NE-SW diagonal direction. Since $\binom{k}{m}\binom{m}{s} = \binom{k}{m}\binom{m}{m-s} = \binom{k}{m}\binom{m}{s}$

 $[\]binom{k}{k-m}\binom{m}{s}$ all elements with the same corresponding index in this three directions are the same (symmetry property).

² To be exact, Pascal's tetrahedron includes only the trinomial coefficients $\binom{k}{m}\binom{m}{s}$. This is the case if a = b = c = 1.

Consequently, the multinomial theorem for entries of a commutative or non-commutative ring, V is obtained in the same form as the ordinary multinomial theorem for real entries (cf. [3]).

Theorem 1 (General multinomial theorem) Using the symmetric product (1) together with the convention (8), the powers of a sum of n different elements $a_1, \ldots a_n$ of an arbitrary commutative or non-commutative ring V can be expanded in the form

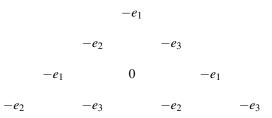

$$(a_1+a_2+\cdots+a_n)^k = \sum_{|\mu|=k} \binom{k}{\mu} \vec{a}^{\mu}$$

where, as usual, $\binom{k}{\mu} = \frac{k!}{\mu!}$, $|\mu| = \mu_1 + \mu_2 + \dots + \mu_n$ and $\vec{a}^{\mu} = a_1^{\mu_1} \times a_2^{\mu_2} \times \dots \times a_n^{\mu_n}$, $k \in \mathbb{N}$.

It follows straightforward that the trinomial expansion (5) can now be rewritten as

$$(e_1 + e_2 + e_3)^k = \sum_{m=0}^k \sum_{s=0}^m \binom{k}{m} \binom{m}{s} e_1^{k-m} \times e_2^{m-s} \times e_3^s.$$

From (4) it follows, for example, that the central element in the layer \mathscr{L}_3 of Pascal's tetrahedron is given by $\binom{3}{2}\binom{2}{1}e_1 \times e_2 \times e_3 = (e_1[e_2e_3 + e_3e_2] + e_2[e_1e_3 + e_3e_1] + e_3[e_1e_2 + e_2e_1]) = 0$ and the final form of \mathscr{L}_3 is

3. THE COMPLETE CHARACTERIZATION OF PASCAL'S HYPERCOMPLEX TETRAHEDRON

For the complete characterization of Pascal's tetrahedron built from hypercomplex entries for arbitrary values of k we use the fact that $(e_1 + e_2 + e_3)$ is a paravector and therefore $(e_1 + e_2 + e_3)^{2l} = (-1)^l (1 + 1 + 1)^l$, l = 0, 1, 2, ... This means that in the case of even k (k = 2l) the \mathscr{L}_k is filled with the multinomial numbers of $(1 + 1 + 1)^l$ multiplied by $(-1)^l$, but the rows, (NE-SW)- resp. (NW-SE)-diagonals with odd indices contain only zeros. For the case of odd k (k = 2l + 1) we use the fact that $(e_1 + e_2 + e_3)^{2l+1} = (-1)^l (1 + 1 + 1)^l (e_1 + e_2 + e_3)$ which shows (without any calculation of the concrete value of $e_1^{k-m} \times e_2^{m-s} \times e_3^s$) that a layer of odd degree contains only real multiples of the hypercomplex generators e_1 or e_2 or e_3 , with the exception of k = 1. Taking this into account we can prove the following

Theorem 2 Let $\mathscr{E}^3_{(k,m,s)} := \binom{k}{m} \binom{m}{s} e_1^{k-m} \times e_2^{m-s} \times e_3^s$, k = 0, 1, 2, ...; m = 0, 1, ..., k; s = 0, 1, ..., m and

$$(e_1 + e_2 + e_3)^k = \sum_{m=0}^k \sum_{s=0}^m \binom{k}{m} \binom{m}{s} e_1^{k-m} \times e_2^{m-s} \times e_3^s = \sum_{m=0}^k \sum_{s=0}^m \mathscr{E}_{(k,m,s)}.$$

Then the entries $\mathcal{E}_{(k,m,s)}$ of Pascal's hypercomplex tetrahedron are given in the following form:

I. If k is even then

$$\mathscr{E}_{(k,m,s)} = \begin{cases} (-1)^{\frac{k}{2}} \binom{\frac{k}{2}}{\frac{m}{2}} \binom{\frac{m}{2}}{\frac{s}{2}}, & m \text{ even, } s \text{ even,} \\ 0, & otherwise. \end{cases}$$

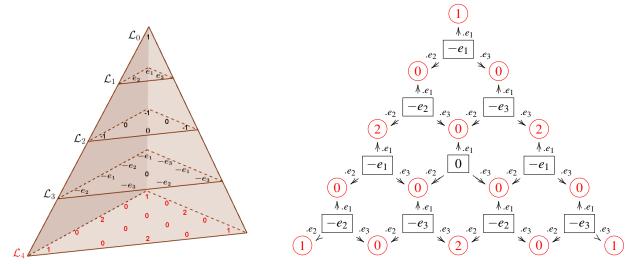

II. If k is odd then

$$\mathscr{E}_{(k,m,s)} = \begin{cases} 0, & m \text{ even, } s \text{ odd,} \\ (-1)^{\frac{k-1}{2}} {\binom{k-1}{2}} {\binom{m}{2}} {\binom{m}{2}} e_1, & m \text{ even, } s \text{ even,} \\ (-1)^{\frac{k-1}{2}} {\binom{k-1}{2}} {\binom{m-1}{2}} e_3, & m \text{ odd, } s \text{ odd,} \\ (-1)^{\frac{k-1}{2}} {\binom{k-1}{2}} {\binom{m-1}{2}} {\binom{m-1}{2}} e_2, & m \text{ odd, } s \text{ even.} \end{cases}$$

Moreover, following the recurrence properties of Pascal's tetrahedron with real entries (cf. [2]) it can be shown that the numbers on every k-th layer are the sum of the three adjacent numbers in the (k-1)-th layer (the layer above the k-th layer in the tetrahedron), each one multiplied by e_1 or e_2 or e_3 , respectively, i. e. we have

$$\mathscr{E}_{(k,m,s)} = \mathscr{E}_{(k-1,m-1,s-1)}e_3 + \mathscr{E}_{(k-1,m-1,s)}e_2 + \mathscr{E}_{(k-1,m,s)}e_1.$$

The following pictures try to illustrate Pascal's tetrahedron as well as the mentioned recurrence relation for the case k = 4.
